Nature of Relationship. With respect to the relationship between the main respondent and the discussant, the pattern of effects for accuracy is different from the pattern for confidence. People are confident about their assessment of a spouse's or relative's political preferences, but that does not mean they are correct. The lack of effect on accuracy parallels the lack of effect on accessibility. People are likely to believe they make accurate judgments about family members' political views, but their confidence appears to be misplaced!

Agreement Efects. The results on agreement show even more divergence from earlier models. Accuracy is dramatically enhanced by agreement within the dyad, as well as by agreement between the discussant's self-reported preference and the main respondent's perception of preferences within the residual network. The magnitudes of these effects are shown in Figure 1A, where we can see that particularly strong effects arise due to the residual network. Although there was little evidence of an agreement effect on accessibility or judgmental confidence, there is strong evidence for such an effect on accuracy.

Preference Efects. The political preferences of main respondents and discussants give rise to a pattern of effects that parallels many of the earlier results. In particular, accuracy is enhanced to the extent that discussants' preferences are extreme—both with respect to partisanship and with respect to candidate

evaluations. As Figure 1B shows, discussants are much more likely to be perceived accurately if they send clear and unambiguous messages; extreme partisans with extreme views about the candidates are more than 40 percentage points more likely to be perceived accurately than independents who are neutral. Finally, there is no evidence to suggest that the extremity or accessibility of main respondent preferences diminish the likelihood of perceiving discussant preferences accurately.

Other Political Characteristics. Main respondents are more likely to perceive preferences accurately for "political" discussants than for "important matters" discussants. In contrast, neither the imputed political knowledge of the discussant nor the frequency of political discussion affects accuracy.

Campaign Dynamics. The election campaign has a substantial effect on the accuracy of main respondent perceptions of discussant preferences. The magnitude of the effect is shown in Figure 1C, both for "important matters" discussants with whom the main respondent reports infrequent political conversation and for "political" discussants with whom the main respondent reports frequent political discourse. Discussants are about 30 percentage points more likely to be perceived accurately at the end of the campaign than at the beginning.

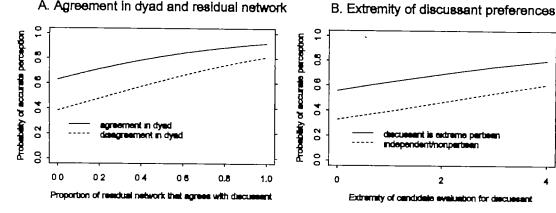

As the campaign progresses, people develop more readily accessible perceptions about associates' preferences, and these campaign effects are directly reflected in the accuracy of their judgments. It appears that the campaign stimulates deliberative democracy not only by making respondents more confident in more highly accessible judgments but also by improving the quality of those judgments, as measured in terms of accuracy. ¹³ In contrast, some variables affect only accuracy, most notably political disagreement within both the dyad and the residual network. Disagreement does not seriously compromise the confidence or accessibility of judgments, but it does compromise the accuracy of judgments.

CONCLUSION

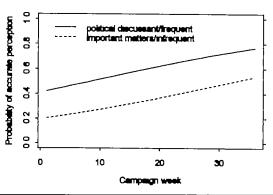

Our analysis offers little support for the importance of selective perception or conflict avoidance in patterns of political communication among citizens. If the data had revealed that extreme partisans are less likely to make accurate judgments about others' preferences, then we might conclude that either (1) the discussant is sending an ambiguous political signal in order to avoid disagreement and conflict with a highly opinionated associate, or (2) the highly opinionated main respondent is selectively perceiving the discussant's preference in order to avoid the psychic distress of political

¹⁵ Indeed, the response time for the respondent's own intended/reported vote decreased by one-half second from the period before the election to the period after the election, controlling for candidate evaluations, strength of their partisan identification, and their baseline speed of response.

FIGURE 1. The Effect of Various Factors on the Predicted Probability That the Main Respondent Accurately Perceives the Discussant's Vote Preference

C. Campaign week and discussant type/discussion frequency

Source: Table 1, column 3, logit estimates.

Noter In each part of the figure, the discussant is held constant as a nonrelative who is not a close friend. Partisan accessibility for the main respondent and the discussant is held constant at 1.2 seconds. Main respondent partisen extremity is held constant at 2, and candidate evaluation extremity is held constant at 2.1. Imputed discussant knowledge is held constant at 2.3. The primary season dummy variable is held constant at 0.

In A, dyadic agreement and readual network agreement are vaned across their ranges. The campaign week is held constant at 25. Frequency of discussion is held constant at 3. The discussant is held constant at a political discussant. Partisan extremity of the discussant is held constant at 2. Candidate evaluation extremity of the discussant is held constant at 2.1.

In B, the partieun extremity and candidate evaluation extremity of the discussant are varied across their observed ranges. The dyad is held constant at disagreement, and the residual network is held constant at a disagreement level of .5. Other variables are held constant as in A.

in C, the campaign week is varied across its range for political discussants with whom the respondents often discuss politics and for important matters discussants with whom they never discuss politics. Discussant parties extremity is held constant at 2, and candidate evaluation extremity is held constant at 2.1. Other variables are held constant as in B.

disagreement. But we see no effect of main respondent extremity on either accuracy or accessibility. The extremity of the main respondent's candidate preference does enhance judgmental confidence, but in the absence of any distorting effect on accuracy, such an effect offers little support for the important influence of selective perception or psychic distress on political communication.

Moreover, whereas there is no evidence that strong partisans are bad listeners, it is clear that they are more effective communicators. Main respondents are more likely to offer accessible, confident, and accurate judgments regarding the political preferences of discussants who hold more extreme views. This is another way of saying that people's political perceptions of one another are subject to the actual flow of information that occurs through social communication, and people with extreme preferences are more likely to communicate unambiguous infor-

mation. Once again, political judgment is not an artifact of selective perception but depends on the quality of political information.

The analysis encourages us to rethink the nature of disagreement and selective perception with respect to political communication. If disagreement produces the psychic discomfort and distress that leads to selective perception, it might be expected to produce political judgments that are hesitant or uncertain. Instead, we see no effects on accessibility and confidence due to disagreement between the respondent and the discussant, and only relatively weak and inconsistent effects arise due to the perceived distribution of preferences among the remaining members of the residual network.

In contrast, the distribution of preferences within the dyad and the residual network register profound effects on accuracy. If a person does not hold a particular preference, and if she does not believe that others hold

the preference, her own personal experience tells her that a given individual in her network does not hold the preference either. For that reason, people are much less likely to recognize rare preferences, that is, preferences they perceive to be uncommon in their network of social relations. Hence, an individual's own political preference may be primarily important as a piece of information to use in judging the likely preference of someone else.

Rather than cognitive dissonance and selective perception, it appears that a model of political communication should emphasize the heuristic strategies people use in reaching political judgments about the preferences of others (Sniderman, Brody, and Tetlock 1991; Tversky and Kahneman 1974). When an associate's preference is unclear, individuals might employ an inferential device to resolve the uncertainty, and a personal experience heuristic appears particularly important. Thus, disagreement effects on accuracy arise as the consequence of judgmental errors that occur when people use a reasonable decision-making device which happens to fail in a particular circumstance.

Our findings do not affect theories of cognitive dissonance and selective perception as they relate to the perceptual biases that arise due to discomfort and personal distress over inexplicable differences of opinion (see Ross, Bierbrauer, and Hoffman 1976). Rather, these results lead one to question the extent to which political disagreement produces psychic discomfort in most citizens. For several reasons, it may produce very little of the personal distress associated with selective perception. Many people do not care enough to be upset. Others see political opinions as idiosyncratic expressions of personal preference that do not require explanation, similar to the choice between a Chevrolet and a Ford. Moreover, differences in preference and opinion often are explicable: Tom votes for Democrats because he is a liberal; Jane voted for Dole because she is rich; and so on. In short, most political differences are easily reconciled, readily accommodated, and unlikely to be personally distressing.

Finally and most important, this analysis sharpens our focus on the positive consequences of election campaigns. They improve the quality of political deliberation by stimulating the development of strongly held opinions regarding the candidates and by enhancing the effective communication of these preferences among and between citizens. American presidential elections are often criticized because they start so early and last so excruciatingly long, but it is this length that provides the opportunity for extended public discussion. The outcome may be highly predictable even before the campaign takes place (Gelman and King 1993), but this does not diminish the role of campaigns as an important deliberative device in democratic politics. The successful candidate must survive the collective process of public scrutiny, and stimulating such a process is arguably the most important function of democratic elections.

APPENDIX A: SAMPLE

The main respondent sample (n = 2,174) was drawn from lists of registered voters in the city and county of St. Louis, Missouri, and in Marion County, Indiana (Indianapolis). The response rate was 58%, calculated as the ratio of completions to the sum of completions, refusals, partials, and identified respondents who were persistently unavailable to complete the interview. The response rate drops to 53% if we add households in which no one ever answered the phone despite repeated call backs. The cooperation rate—ratio of completions to the base of completions, refusals, and partials—is 64%. Comparable rates for the discussant sample (n = 1,475) were 59%, 56%, and 72%.

The weekly preelection interview target was 20 main respondents and 15 discussants at each of the two study sites, and discussant interviews were completed within three weeks of the relevant main respondent interview. After the election, interviews were completed as rapidly as possible without weekly targets, and the time spacing of main respondent and discussant interviews was not controlled. On this basis, 612 main respondents and 452 discussants were interviewed from March through June; 732 main respondents and 384 discussants were interviewed from July through the election; and 830 main respondents and 639 discussants were interviewed after the election through early January.

Eighty percent of the main respondents responded to the request in their interviews for first names of discussants. Of those who provided this information, 60.8% agreed to give additional contact information (surnames, phone numbers, and so on), 25.7% refused, and the remainder agreed to a call back to collect the information. Ultimately, at least one discussant was interviewed for 872 main respondents, or 40% of the entire main respondent sample of 2,174.

APPENDIX B: MEASUREMENT

Timing Responses

The interviewers activated timers to record the time elapsed between the end of the question and the beginning of the respondent's answer. In addition, latent timers recorded the time elapsed between the answers to two sequenced questions, and they were used in data verification procedures.

Several problems may occur in the use of activated timers. First, respondents sometimes answer before the question is completely read. In such instances, the interviewer recorded the response time as simultaneous by instantaneously turning the activated timer on and off. Second, a "trigger happy" interviewer may stop the timer too quickly. After recording the answer to a question, the interviewers had to indicate whether the timing was successful. We redefined unsuccessful timings as missing data. Third, respondents sometimes ask for clarification, and interviewers were instructed to let the timer run during these questions. To avoid a highly skewed distribution of response times, we defined the timing data as missing when the recorded time was more than three standard deviations above the sample mean. Finally, interviewers occasionally and inadvertently erase valid timings by using a skip command to return to an earlier question at the respondent's request. In these cases, the recorded time is artificially low—faster than the time actually required to turn the timer on and off. Interviewers were instructed to reset the timer to missing, but we could verify the data with the latent timer, which recorded elapsed time between the answers to sequenced questions. If the comparison revealed a time too short to allow a question to be read (one second), the time data were set to missing.

Measuring Preferences and Judgments across the Campaign

Candidate evaluations are moving targets during campaigns, even in the 1996 race, which lacked the volatility of more dramatic contests. When interviews began in early March, there was a long list of Republican candidates, and no one knew what role Ross Perot would play. By early summer, the major party candidates had been determined, although Perot's intentions were still ambiguous. Thus, we adopted several different questions to ascertain the voting intentions of the main respondents and their judgments about discussants' political preferences.

Before the first week of July, we used an open-ended question for the respondent: "If the election was held today, whom would you like to be elected?" We used a closed-choice question for perceptions about a discussant: "As things currently stand, do you think [discussant] will vote for the Democratic candidate, the Republican candidate, an independent candidate, or do you think [discussant] probably won't vote?"

Beginning in the first week of July, we asked respondents: "Thinking about the presidential election, will you vote for Bill Clinton, Bob Dole, some other candidate, or haven't you decided?" The perception question was: "As things currently stand, do you think [discussant] will vote for Bill Clinton, Bob Dole, some other candidate, or do you think [s/he] probably won't vote?"

After the election, the two questions were: "Thinking about the presidential election, did you vote for Bill Clinton, Bob Dole, or did you vote for some other candidate?" "Do you think [discussant] voted for Bill Clinton, Bob Dole, some other candidate, or do you think [s/he] didn't vote?"

Before the major party candidates became clear, only a trivial number of respondents claimed to support an independent other than Perot, but a significant number supported some other Democrat or Republican. Therefore, in the first wave of the study—when respondents were asked the openended version of the question—we distinguished the answers as support for Democratic candidates, Republican candidates, or Perot. Once the major party candidates became clear, only a very insignificant number of respondents named someone other than Dole, Clinton, or Perot, so we set these "other" responses to missing.

Dependent Variables and Measures

Accessibility of main respondent's judgment regarding discussant's vote preference: See above for question text. Response time in hundredths of seconds.

Main respondent's confidence in judgment: "How difficult or easy was it to say how [discussant] voted/will vote?" Scale: 0 = does not know discussant vote; 1 = very difficult; 2 = somewhat difficult; 3 = somewhat easy; 4 = very easy.

Accuracy of the main respondent's judgment: See above for question text. Recorded 1 if main respondent's judgment agrees with discussant's self-reported preference; 0 otherwise.

Explanatory Variables and Measures

Mean network response time in the residual network: See above for question text. Mean of logged response times to preference questions about all discussants other than the one in the particular dyad.

Question order for perception of discussant: The sequence (1-5) in which the respondent is asked about each discus-

sant's candidate preference; for example, a value of 2 means the question about a particular discussant was asked second in the sequence.

First named discussant: Recorded 1 if the discussant was the first name generated by the respondent, 0 otherwise.

Spouse: "Is [discussant] a spouse or partner? other relative? or unrelated by blood or marriage?" Recorded 1 if discussant is a spouse; 0 otherwise.

Another relative: See preceding for question text. Recorded 1 if discussant is a nonspouse relative, 0 otherwise.

Close friend: "Would you say [discussant] is a close friend, a friend, or just someone that you regularly come into contact with?" Recorded 1 if discussant is a close friend, 0 otherwise.

Agreement with discussant in this dyad: Recorded 1 if there is agreement in the self-reported candidate preferences of main respondent and discussant, 0 otherwise.

Proportion of residual network that agrees with discussant: The residual network is defined as all the discussants identified by the respondent, except for the discussant in a particular dyad. Scored as the proportion of the residual network perceived to hold a candidate preference that agrees with the self-reported preference of the discussant in a particular dyad.

Partisan accessibility: "Generally speaking, do you think of yourself as a Republican, a Democrat, an Independent, or what?" Response time to the question.

Partisan extremity: Coded on the basis of response to the party identification question. Scale: 0 = independent or nonidentifier; 1 = leans toward Democrats or Republicans; 2 = not strong identifier, 3 = strong identifier.

Candidate evaluation extremity: "Using any number from 1 to 5, how unfavorable or favorable do you feel toward Bill Clinton/Bob Dole?" Scored as the absolute value of the difference between evaluations of the two major party candidates; range is 0 (indifferent) to 4 (most opinionated).

Imputed discussant knowledge: "Generally speaking, how much do you think [discussant] knows about politics?" Scale: 1 = not much at all; 2 = an average amount; 3 = a great deal.

Reported discussion frequency with discussant: "When you talk with [discussant], do you discuss political matters: often [4], sometimes [3], rarely [2], or never [1]?"

Campaign week: Week of interview. Scored from 1 = first week in March to 36 = election week and beyond.

Primary season: Scored 1 if week of interview is earlier than first week in July, 0 otherwise.

Network Name Generator

The political network variable was scored 1 if the respondent answered the politics name generator question, 0 if the respondent answered the important matters question.

Politics: "From time to time, people discuss government, elections and politics with other people. I'd like to know the people you talk with about these matters. These people might or might not be relatives. Can you think of anyone?"

Important matters: "From time to time, people discuss important matters with other people. Looking back over the last few months, I'd like to know the people you talked with about matters that are important to you. These people might or might not be relatives. Can you think of anyone?"

The Effects of Canvassing, Telephone Calls, and Direct Mail on Voter Turnout: A Field Experiment

ALAN S. GERBER and DONALD P. GREEN Yale University

e report the results of a randomized field experiment involving approximately 30,000 registered voters in New Haven, Connecticut. Nonpartisan get-out-the-vote messages were conveyed through personal canvassing, direct mail, and telephone calls shortly before the November 1998 election. A variety of substantive messages were used. Voter turnout was increased substantially by personal canvassing, slightly by direct mail, and not at all by telephone calls. These findings support our hypothesis that the long-term retrenchment in voter turnout is partly attributable to the decline in face-to-face political mobilization.

uring the last half-century, a dramatic transformation has occurred in the manner in which voters are mobilized. The election campaigns described by Gosnell (1937), Sayre and Kaufman (1960, chap. 6), and Wolfinger (1974, chap. 4) relied heavily on face-to-face contact between voters and those seeking their support. Notably absent from such accounts are professional campaign consultants, direct mail vendors, and commercial phone banks, all of which have gradually replaced work performed by party activists. The advent of modern campaign tactics (Broder 1971; Ware 1985) has coincided with a decline in the proportion of adults who report working for a political party. Based on an annual aggregation of Roper surveys between 1973 and 1994, Putnam (2000, 41) reports a steady decline in this proportion: Whereas 6% of the public reported working for a political party in the early 1970s, just 3% did so in the mid-1990s.

At the same time, there has been a marked decline in the size and vitality of nonpartisan organizations. In the mid-1960s, 2.4 of every 1,000 women over the age of 20 belonged to the League of Women Voters, compared to .79 in 1998 (Putnam 2000, 438–44). A similar fate has befallen such civic organizations as the Lions, Rotary, and Kiwanis Clubs, which have experienced sharp membership declines since the 1960s. Due to the changing character of both partisan and nonpartisan organizations, voter mobilization has become increasingly impersonal, and messages that once might have been delivered in person are now communicated using mass marketing techniques.

The decline of personal mobilization has arguably contributed to the erosion of voter turnout in the United States since the 1960s. This hypothesis is related to, yet distinct from, Rosenstone and Hansen's (1993) contention that diminishing rates of turnout are a result of a decline in the volume of mobilization

activity. As Abramson, Aldrich, and Rohde (1998, 85) point out in their discussion of Rosenstone and Hansen, there has been no clear trend over time in the proportion of American National Election Study (ANES) respondents who report some form of contact with political parties or campaigns, whether personal or impersonal. When read in conjunction with the trend lines compiled by Putnam, the ANES data are consistent with the view that campaigns are reaching as many people as ever but through less personal means.

Our hypothesis about declining turnout rates rests on the claim that personal canvassing mobilizes voters more effectively than other modes of contact that have taken its place, such as direct mail or telephone appeals. The literature on collective action and prosocial behavior supports this conjecture. Studies of blood donations, recycling, and "good deeds" underscore the importance of delivering urgent requests and making vivid the obligation to act (Christensen et al. 1998; Wang and Katzev 1990), and these blandishments seem particularly effective if delivered in person (Spaccarelli, Zolik, and Jason 1989). The special force of face-toface contact is illustrated by Reams and Ray (1993) and Jason et al. (1984), whose experiments demonstrate that recycling and blood donations are particularly responsive to in-person appeals.

There is good reason to suspect that personal canvassing is an effective means by which to mobilize voter turnout, but its effects have seldom been gauged reliably. Nonexperimental studies, beginning with Kramer (1970), tend to rely on survey data to examine the relationship between turnout and reported contacts with political organizations or candidates (Blydenburgh 1971; Cain and McCue 1985; Caldeira, Clausen, and Patterson 1990; Kramer 1970; Lupfer and Price 1972; Price and Lupfer 1973; Wielhouwer and Lockerbie 1994; see also Huckfeldt and Sprague 1992). Rosenstone and Hansen (1993), for example, regress reported voter turnout on reported contact with candidates or political parties. An important drawback to this approach is that political contact may not be an exogenous predictor of turnout. If parties direct their appeals disproportionately to committed partisans, those most likely to vote will also be most likely to receive contact, and the apparent link between contact and turnout may be spurious. Regression analyses generally include a host of control variables, but it is

Study	Date	Type of Election	Number of Subjects (Including Control Group)	Treatment	Effect on Turnout
Gosnell (1927)	1924	Presidential	3,969	Mall	+1%
Gosneli (1927)	1925	Mayoral	3,676	Mail	+9%
Eldersveld (1956)	1953	Municipal	41 43	Canvass Mali	+42% +26%
Eldersveld (1956)	1954	Municipal	276 268 220	Canvass Mali Telephone	+20% +4% +18%
Adams and Smith (1980)	1980	Special election, City Council	2,650	Telephone	+9%
Miller, Bositis, and Baer (1981)	1981	Primary	79 80 81	Canvass Mall Telephone	+21% +19% +15%

Note The subjects in all experiments were registered voters. In Eldersveid (1966), subjects were selected in 1953 from those who opposed or had no opinion about charter reform, in 1964 from those who had voted in national but not local elections. This table includes only attudies that used random assignment to treatment and control groups (or near-random assignment in the case of Goenell 1927).

"These are the effects given in the tables of the research report. They are not adjusted for contact rates.

unclear whether these covariates eliminate the problem. Another important limitation of survey-based studies is that the researcher has no control over, and often little knowledge of, the frequency or nature of the political contact.¹ The measure of party contact drawn from the ANES, for example, makes no distinction between telephone calls and personal canvassing. If these two modes of contact have different effects, measures that fail to differentiate them will produce distorted results.

More methodologically defensible, although rare, are experimental studies of mobilization, the results of which are summarized in Table 1. The experimental tradition harks back to Gosnell's (1927) studies in Chicago, which assigned certain city blocks to receive nonpartisan mail reminders to register and vote. Gosnell found that turnout increased by 1% in the presidential election of 1924 and 9% in the municipal election of 1925. Adams and Smith (1980) examined the effectiveness of one mode of voter mobilization, telephone calls, and found that partisan appeals had significant effects in a city council election in Washington, D.C. The principal experiment to examine the effects of personal canvassing in conjunction with mailings that used varying types of nonpartisan appeals was conducted by Eldersveld (1956; Eldersveld and Dodge 1954) in two Ann Arbor, Michigan, municipal elections.2 In both cases the effects of canvassing and mail were statistically significant, but total sample size for all conditions was just 453; the effects can only be inferred

¹ The fact that the independent variable is reported political contact raises further concerns. A number of studies indicate that respondent reports are subject to potentially serious measurement error stemming from faulty memory or deliberate misreporting.

with a 95% confidence interval of plus or minus 20 percentage points, so no reliable inferences can be made about the relative effectiveness of different forms of mobilization. The problem of statistical power is even more acute in the Miller, Bositis, and Baer (1981) study of primary election voting in Carbondale, Illinois. It compared the effectiveness of partisan telephone, mail, and personal appeals, but the total sample size was only 215. As did Eldersveld, these authors found personal canvassing to be highly effective, but the range of uncertainty causes the effects to fall short of conventional levels of statistical significance. An additional source of concern is the fact that Eldersveld (1956), Adams and Smith (1980), and Miller, Bositis, and Baer (1981) fail to adjust for their inability to reach some people in the treatment groups. As we explain below, their practice of folding uncontacted subjects originally assigned to treatment groups into the original control group tends to overstate the effectiveness of mobilization campaigns.

Due to the significant limitations of previous research, students of voting behavior do not have a clear sense of either the current magnitude of mobilization effects or the relative effectiveness of different mobilization strategies. Experimental studies have generated the most convincing evidence of causality but are either dated or small in scale. For these reasons we launched a series of turnout experiments in which randomly selected households were exposed to mailings, telephone calls, or personal appeals before the November 3, 1998, general election. Following Eldersveld, we varied the content of appeals, stressing civic duty, neighborhood solidarity, or the prospect of a close election. As did Miller, Bositis, and Baer (1981), we examined the effects of repeated mail contact. Because our sample sizes are roughly 100 times larger than the Eldersveld (1956) or Miller, Bositis, and Baer (1981) studies, we can draw far more precise inferences about the effectiveness of various mobilization tactics. Our

² The finding that participation can be stimulated by mobilization efforts is consistent with evidence that people subjected to a preelection interview are also more likely to vote, even though the interviews are not designed to encourage voting. For details, see Anderson, Silver, and Abramson 1988; Granberg and Holmberg 1992, Kraut and McConohay 1973; Traugott and Katosh 1979; and Yakch 1976.

	Number of Direct Mallings Sent				
	None	One	Two	Three	Total
No Telephone Call: Personal canvassing

findings indicate that personal canvassing is highly effective, much more so than the direct mail and telemarketing campaigns that have come to displace it. The implication is that the decline in voter turnout may be due to the changing character of American campaigns. Although the volume of mobilization activity remains considerable, its increasingly impersonal nature draws fewer people to the polls.

EXPERIMENTAL DESIGN

This field experiment was conducted in New Haven, Connecticut, which has a population of approximately 100,000. In September 1998 we obtained a complete list of registered voters, from which we created a data set of all households with one or two registered voters. To eliminate students from the sample, all names with post office box addresses were excluded, as was one voting ward that encompasses a university and student housing. We were left with 29,380 individuals (22,077 households), whose participation in the 1998 election could be determined from public records.

Our study was designed to measure the effect of personal canvassing, telephone calls, and direct mail appeals on voter turnout. Through a series of random assignments, the sample was divided into control and experimental groups. Table 2 shows the sample sizes of each group for the $2 \times 2 \times 4$ design.³ The treatment and control groups for the three experiments overlap, such that 10,800 people were assigned no intervention; 7,369 were sent at least one mailing but received no other appeal; 2,686 were slated only for personal contact; and 958 were assigned to receive only telephone reminders. The remainder of the sample, 7,567 people, was assigned to two or more treatments. Assignment to the personal canvassing experiment was designed to be uncorrelated with the telephone and mail experiments, so that it could

be analyzed separately. Random assignment to each of the telephone/mail treatments was performed in a manner that made calls more frequent among those who received mail. Thus, these two treatments are correlated, and their effects must be estimated using multivariate methods.

Overall, the treatment group for personal canvassing contained 5,794 people, the control group 23,586. For the direct mail experiment, 14,719 people were in the treatment group, and 14,661 were in the control group. The effectiveness of randomization was checked using voter turnout data from the 1996 presidential election. Based on a chi-square test with 15 degrees of freedom for the 16 groups defined in Table 2, we cannot reject the null of independence between treatments and past voting behavior (p > .10).

Personal Canvassing Procedure

During each Saturday and Sunday for four weeks before the election, canvassers were sent to contact randomly selected registered voters. They were paid \$20 per hour and were primarily graduate students. New Haven has a substantial minority population and a significant proportion of non-English speakers. More than half the canvassers were African American or fluent in Spanish, and when possible they were matched to the racial and ethnic composition of the neighborhoods they walked.

For safety reasons, all canvassing was done in pairs and ceased at sunset. This procedure constrained both the pool of available canvassers and our ability to contact people not at home during the day. In contrast to conventional canvassing efforts, we targeted certain households rather than entire streets, which meant that more time was devoted to locating specific addresses and walking from one to the next. Consequently, canvassers were able to contact only 1,615 (28%) of the 5,794 people in the personal canvassing treatment group. Examination of the data showed a fairly even

³ Random assignment was done at the household level. The results we present treat individuals as the unit of analysis; as we point out below, however, the results are very similar when we look separately at households containing one or two registered voters. Also, the standard errors we report are very similar to the ones obtained using statistical methods that allow for unmodeled similarities between household members, such as generalized least squares or resampling.

⁴ For the subset of persons not contacted, two supplementary experiments were performed. In certain wards, 719 were randomly chosen to receive a mailer, along with a refrigerator magnet that had the election date printed on it. A separate analysis indicated that this

contact rate across the 29 wards of the city. The average contact rate by ward was 28%, with a standard deviation of 9%.

To bolster the external validity of the experiment, we used a variety of messages when encouraging people to vote. These were developed after a series of conversations with four professional campaign consultants, each of whom suggested effective nonpartisan appeals.5 The final versions reflect both themes used in actual mobilization efforts and social science explanations of voting: civic duty, close election, and neighborhood solidarity. Upon contacting one or both of the registered voters at each address, canvassers read the following introduction: "Hi. My name is _. I'm part of Vote New Haven '98, a nonpartisan group working together with the League of Women Voters to encourage people to vote. I just wanted to remind you that the elections are being held this year on November 3d."6

In the civic duty version, the script continued: "We want to encourage everyone to do their civic duty and exercise their right to vote. Democracy depends on the participation of our country's citizens." The close election version stated: "Each year some election is decided by only a handful of votes. Who serves in important national, state, and local offices depends on the outcome of the election, and your vote can make a difference on election day." The neighborhood solidarity version stated: "Politicians sometimes ignore a neighborhood's problems if the people in that neighborhood don't vote. When politicians see a lot of people turning out to vote, they know they should pay attention to issues important to people who live around here."

The civic duty script appeals to a sense of obligation. It states a norm that citizens are expected to vote and contends that democracy depends on political participation. This appeal parallels a central explanation of large-scale collective action, the notion that citizens derive intrinsic satisfaction from participation (Riker and Ordeshook 1968). In contrast, the last two messages emphasize two ways in which voting may be instrumental. First, the close election appeal reminds citizens that a single vote can determine the outcome. The odds of casting a pivotal vote are remote, but the stakes are high, and elections are close from time to time. Alternatively, by voting, one calls politicians' attention to the concerns of one's neighborhood. The

subsidiary treatment had a negligible effect that is swamped by a large standard error. For another subset of those not reached (683 persons), canvassers left leaflets if no one was home. This treatment was not strictly random and occurred only in certain wards. We found no differences in canvassing effectiveness between wards with or without leafleting (p > .10, one-talled test). Even if the true effects of leafleting and mallers were equivalent to three mailings, the overall bias to our estimate of the effect of personal canvassing would be less than 1 percentage point.

⁵ The League of Women Voters, New Haven Chapter, also helped in the development of the messages and canvassing procedures. neighborhood solidarity theme was developed in light of the special political circumstances in the East Shore section of New Haven, where a secession movement has been active for more than a decade. In sum, these appeals encompass leading themes of voter mobilization campaigns.

Direct Mall

The direct mail experiment was intended to measure the turnout effect of both the number of mailings received and the message conveyed. To gauge the first effect, we divided the treatment group into three subgroups and sent one, two, or three mailings, respectively. As shown in Table 2, each subgroup contained approximately 4,900 persons. The mailings were sent out at three intervals: 15 days, 13 days, and 8 days before the election. The subgroup that received two mailings was sent mail on the two dates closest to the election, and the single mailing was sent 8 days before the election. Within each of these groups, we randomly generated three additional subgroups, one for each type of political message. (Subjects who received a certain appeal through personal canvassing received the same type of appeal by mail.) To avoid sending anyone the same mail piece twice, nine different postcards were required, three for each form of appeal. The postcards were prepared by a professional political consulting firm that specializes in direct mail. All nine treatments were three-color postcards. A description of each card is given in the appendix.

Telephone Calls

During the three days before and including the election, a random subset of registered voters received calls urging them to vote. These took place on Sunday evening and all day Monday and Tuesday. A large out-of-state telemarketing firm, which conducts several such get-out-the-vote campaigns during each election cycle, conducted the 30-second calls. Although the telephone numbers taken from the voter registration files were cross-checked using data obtained from Survey Sampling, Inc., many wrong numbers remained. And, as is the norm, only a portion of the potential respondents could be contacted during the three days, despite repeated attempts.7 Of the 6,754 people in the treatment group, only 2,166 (32.1%) resided in a household in which at least one registered voter completed a conversation with the phone bank. The telephone scripts mirrored those for personal canvassing, but only the civic duty and close election appeals were used. We excluded neighborhood solidarity because that might be an implausible appeal coming from an out-of-state phone bank (it was expected that those called would note nonlocal accents). Subjects other-

⁶ The closing line of the script was varied randomly. With 40% probability, canvassers ended with: "We hope you'll come out and vote." Otherwise, they closed with a question: "Can I count on you to vote on November 3d?" We found the "question effect" nonsignificant (p > .05) and collapsed these experimental categories for purposes of analysis.

⁷ Since the treatment group and control group are formed by random assignment, the failure to contact the entire treatment group due to wrong or unlisted numbers will not lead to biased results if the estimator in equation 6 is used.

Unadjusted Relationship between A	Actual (as Opposed to Attempted) Contact ar	nd Voter Turnout
	Not Contacted In Person	Successfully Contacted In Person

wise in the neighborhood solidarity condition were given an appeal based on civic duty.

RESULTS

In presenting the experimental results, we first provide tables that show the basic findings on personal canvassing. These convey the main findings in an accessible fashion and also illustrate our statistical method for handling contact rates. We then present a regression analysis that confirms the results but allows us to estimate these and other experimental effects with more statistical precision.

The Personal Canvassing Experiment

To underscore the importance of methodological nuance in interpreting the effects of canvassing, Table 3 shows the effect of in-person contact on turnout in more than one way. The upper half of the table compares the turnout rate of those who were contacted face-to-face with those who were not. The group not contacted, however, is a combination of the control group (whom we made no attempt to reach) and those in the treatment group whom the canvassers were unable to reach. In some previous experimental studies (e.g., Adams and Smith 1980; Eldersveld 1956), the treatment effect is calculated only by this method of measuring the difference in turnout rate between those who were contacted and those who were not. Nonexperimental studies using survey data implicitly take a similar approach as well, since these compare the voting rates of those who report contact and those who do not. In our study the difference between the voting rate of those contacted and those not contacted is very large, 14.6 percentage points.

This number doubtless overestimates the effect of canvassing. If voters who are easier to reach are also

more likely to vote, then the canvassing effect is partly spurious. To estimate the effect of the treatment properly, we must distinguish the treatment effect from the higher probability of voting among those easier to contact. One way to do this is to augment the experimental design. We might have added another control group—those with whom canvassers make contact and deliver a nonpolitical message. An alternative is to derive an estimator making use of the fact that the group we intended to treat is a random subset of the entire sample, and therefore the proportion of easy-to-contact voters is the same in the treatment and control groups. We adopted this second approach, which is elaborated by Angrist, Imbens, and Rubin (1996).

To isolate the treatment effect, we reason as follows. Suppose that a subset of the experimental group is contacted. For any given level of canvassing effort, the population can be divided into two groups, those who are reachable and those who are not. Let α be the proportion of the population that is reachable. Let p_m be the probability that a nonreachable person votes, let p_r be the probability that a reachable person votes without the experimental treatment, and let $p_r + t$ be the probability that a reachable person votes after being exposed to the experimental treatment. Our aim is to estimate the value of t. The probability that a randomly selected member of the control group will vote equals:

$$P_C = \alpha p_r + (1 - \alpha) p_{rr} \tag{1}$$

This probability equals the probability that an individual member of the control group is "reachable" (α) times the probability a reachable person votes (p_r) plus the probability the person is not reachable (1 $-\alpha$) times the probability a person of this type votes (p_{rr}). The probability that a randomly selected member of the treatment group will vote equals:

TABLE 4. Effects of Personal Canvassing on Voter Turnout, by Type of Nonpartisan Appeal Number of Registered Voters Number of Persons Type of Appeal Turnout Rate In Treatment Group **Actually Contacted** Unadjusted Turnout Rates among Experimental Subgroups CMc duty 47.2% 1,985 534 Neighborhood solidanty 46.3% 1,881 546 Election is close 48.1% 1,928 535 Control 44.8% 23,586 N/A Implied Effects of Personal Contact on Voter Turnout Turnout Differential (2.43%)/Contact Rate (26.90%) = 9.1% Standard Error (4.3) Neighborhood solidartty Turnout Differential (1.48%)/Contact Rate (29.03%) = 5.1% Standard Error (4.1) Election Is close Turnout Differential (3.36%)/Contact Rate (27.75%) = 12.1% Standard Error (4.2)

$$P_E = \alpha(p_r + t) + (1 - \alpha)p_{rer}, \qquad (2)$$

where the difference between equations 1 and 2 is due to the effect of the experimental treatment. Combining equations 1 and 2, we derive an expression for t:

$$t = \frac{P_E - P_C}{\alpha}. (3)$$

Although the population probabilities are not observed, sample data can be used to obtain an estimate of t. First, using the law of large numbers,

$$plim V_E = P_E, \qquad plim V_C = P_C, \qquad (4)$$

where V_E is the percentage of the treatment group that votes, and V_C is the percentage of the control group that votes. Similarly,

$$\frac{N_r}{N_E} = \alpha, (5)$$

where N_r is the number of subjects in the treatment group who were reached for the experimental treatment, and N_E is the number of subjects in the treatment group overall. Using equations 4 and 5, we obtain a consistent estimator of t:

$$plim \frac{V_E - V_C}{\frac{N_r}{N_E}} = t. ag{6}$$

Equation 6 says that, to find the treatment effect, subtract the turnout rate of the control group from the turnout rate of the experimental group and divide this difference by the observed "contact rate," which is 28%. Using this formula, we find that personal contact raises the probability of turnout by 8.7 percentage points, with a standard error of 2.6. The null hypothesis that canvass-

ing does nothing to increase turnout can be decisively rejected, using a one-tailed test (p < .01).8

Table 4 suggests that the effects of personal contact do not vary significantly across messages. The close election message boosts turnout rates by 12.1%, which is slightly better than the 9.1% associated with the civic duty appeal and substantially better than the 5.1% for neighborhood solidarity. These findings are suggestive, but the standard errors associated with the estimates are far too large to reject the null hypothesis that the messages have equal effects. Looking ahead to the experiments using direct mail and telephone calls, we find a similar pattern of insignificant differences across messages. Since we cannot rule out the view that any plausible mobilization appeal works equally well, the analysis that follows focuses exclusively on the relative effectiveness of delivering the appeal in person, by telephone, or through the mail.

Regression Results

Regression analysis permits us to conduct a more comprehensive analysis, taking into account all the treatments in our experiment. Regression analysis has the further virtue of introducing covariates, such as past voting history, that reduce the unexplained variance in voting rates and allow for more efficient estimation of the experimental effects. For reasons cited above, however, any regression analysis must attend to the possibility that subjects with a higher propensity to vote are easier to reach in person.

Consider the following simple model of how the experimental treatment affects turnout. Suppose again, for purposes of illustration, that the population can be divided into those who are easy to contact and those who

⁸ These results remain unchanged when we disaggregate the data according to whether the household contains one or two registered voters. For single-voter households, the effect of personal contact is estimated to be 10.0% (SE = 3.7), compared to 8.2% (SE = 3.6) for two-voter households. These estimates are too similar to be differentiated statistically (p > .10).

TABLE 5. Linear and Nonlinear Regression of Voter Turnout on Mode of Contact, with and without Covariates

	Two-Stage Least Squares		Two-Stage Probit	
independent Variables	Coefficient (SE)	Coefficient (SE)	Coefficient (SE)	
Personal contact	.087 (.026)	.098 (.022)	.323 (.074)	
Direct mallings (0 to 3)	.0058 (.0027)	.0063 (.0023)	.0214 (.0067)

Age		.0188 (.0008)	.0649 (.0022)	
Age squared		000133 (.000007)	000467 (.000020)	
Number of registered voters in household (1 or 2)		.058 (.005)	.188 (.014)	
Constant F	.445 5.86	296.66		
Degrees of freedom	29,376	29,342	29,342	

Note: The base category for past voting behavior is the set of people who were not registered in 1996. Not reported in this table are the coefficients associated with each of the 29 werds. The first-stage equations include dummy veniables representing the intent-to-treat groups associated with canvassing, phone calls, and direct mail. The first-stage equation also includes covariates for columns 2 and 3 Standard errors for the two-stage probit estimates were obtained using jackknifting.

are not. The probability that a given person in the experiment votes may be expressed as

$$Y = a + b_1 X_1 + b_2 X_2 + e,$$

where Y=1 if the subject votes, $X_1=1$ if the subject is difficult to contact, and $X_2=1$ if the subject is actually contacted; 0 otherwise. Given that X_1 is not observed, we might ignore this variable and regress Y on an intercept and X_2 . This will yield a consistent regression coefficient estimate only if X_1 and X_2 are uncorrelated, or if b_1 equals 0. These special conditions cannot be expected to hold. Unless everyone in the

treatment group is contacted, there will be some correlation between how easy it is to reach a subject and the likelihood they are actually reached. It is also quite reasonable to assume that those who are very hard to reach may also be less likely to vote (i.e., b_1 does not equal 0). Although these points seem straightforward, they have eluded previous research in this area.⁹

The standard solution to the problem of correlation between a right-hand-side variable and the regression error is to find a suitable instrumental variable. In this case, an ideal instrument is at hand. Recall that a valid instrument satisfies two criteria: The variable must be uncorrelated with the regression error, and it must be correlated with the endogenous variable. The probability that subjects are contacted is a function of whether they are randomly selected for the treatment group. This implies that a dummy variable which equals 1 for subjects in the treatment group will be correlated with the endogenous variable. Because the treatment group is generated through random assignment, there is no reason to suppose that those who are easy to contact will be overrepresented. Thus, the expected correlation between the instrumental variable and the regression error is zero.

Table 5 presents two-stage least-squares regression estimates of the effect of each experimental treatment. As indicated earlier, the instrumental variables used in the regressions indicate whether the person was in a given treatment group. For example, the variable Personal Contact equals 1 if the subject was contacted, and the instrumental variable equals 1 if the person was in the group that we intended to treat. Note that the instrumental variable will be correlated with the included variable (being in the intent-to-treat group predicts the likelihood that one is contacted), but the instrumental variable is not correlated with the regression error (treatment group status is due to random assignment). A similar procedure applies to the telephone experiment, with intent-to-treat serving as an instrument for actual contact. For the mail experiment, the instrumental variable and the independent variable are the same, since the assumed contact rate is 100%.10

Official voting and registration records contain useful information about the sample. For example, we know whether a person voted, abstained, or was absent from the voter rolls in the 1996 general election. We also know an individual's age, party registration, voting ward, and whether s/he is the sole registered adult in the household or is one of two. Each of these covariates contributes significantly to the predictive accuracy

⁹ Consider some of the seminal work in this area. Kramer (1970) interprets the higher turnout rate among those reached by a party or candidate as the marginal effect of contact. In the classic study by Eldersveld (1956), those unavailable for personal contact were moved into the control group. This practice results in overestimation of the treatment effect.

¹⁰ Our calculations assume that all of the households we intended to treat by mail received the treatment, an assumption implicitly made in all previous mail experiments. In our case, the voter lists were very current and fewer than 1% of the mailings were returned. To adjust the estimated effects for any failure to receive the mail, divide the coefficients in Table 5 by the supposed contact rate.

of the model, which makes for more precise estimates of the experimental effects. Moreover, this background information affords an opportunity to look for interactions between treatment effects and individual attributes.

The multivariate model enhances slightly the apparent effect of personal and mail appeals. Face-to-face contact raises turnout by 9.8 percentage points, and direct mail raises turnout by .6 percentage points for each mailing. Because our most intensive treatment involved only three mailings, we cannot reliably extrapolate out very far. Direct mail vendors informed us that a regimen of 4 to 9 mailings is common in political campaigns. If this practice is grounded in a correct assessment of how mailings stimulate turnout, we might have drawn even more voters to the polls with additional mailings.

One of the most surprising results to emerge from our experiment is the ineffectiveness of telephone appeals. The commercial firm we retained routinely does this kind of work on behalf of parties, campaigns, and interest groups, often on a very large scale, so it was well qualified. Nevertheless, we find no indication whatsoever that telephone appeals raise turnout. The turnout rate for the treatment group (44.5%) was lower than the rate for the control group (45.5%). (The turnout rate among those actually contacted by phone was 60.7%, but this number is evidently a spurious reflection of the unobserved characteristics of people who are reachable by phone. This result reinforces our concerns about previous work based on nonexperimental data.) Taking contact rates into account and controlling for other experimental features, telephone calls would seem to have diminished turnout slightly, a conclusion that remains unchanged when we look separately at the civic duty and close election messages. Given our initial expectation that telephoning increases turnout, we take this result to mean that the null hypothesis of no effect cannot be rejected using a one-tailed test.

Although negative results such as these are often viewed with some disappointment, they are not uninformative. Both the phoners and personal canvassers communicated the same information, but only the latter influenced subsequent behavior. Reminding people that an election is imminent has no discernible effect per se on turnout. Precisely what distinguishes personal contact is open to speculation. It may make information more salient and memorable, may trigger a feeling of connectedness to the electoral system, or may more credibly convey the urgency of the request.

In analyzing our mode of contact by experiment, we have focused on main effects associated with the randomly manipulated regressors. Augmenting the regression models to allow for interactions, we find them to be jointly insignificant (p > .05). For example, mail campaigns do not seem to amplify the effectiveness of personal canvassing, or vice versa, regardless of the content of the appeal. Telephone calls neither increase nor decrease the effectiveness of mail or personal appeals. We find no evidence of a second-order interaction among telephone, mail, and personal contact.

The additive nature of these effects runs counter to the hypothesis that get-out-the-vote drives, in and of themselves, signal the importance of the election, thereby raising turnout. If this were so, then those who received a mailer and a telephone call might have been especially impressed by the scope of our Vote '98 campaign. Instead, they reacted much as would be expected based on the behavior of those who received only mail or telephone calls.

Interpretation of the nonexperimental coefficients is clouded by the fact that these regressors gauge voting propensities in an overlapping and incomplete fashion. The effect of party registration, for example, must be understood in light of the fact that we controlled for participation in the 1996 election but not for education. For this reason, we must be cautious about interpreting these coefficients or comparing them to survey-based results. As expected, voter turnout tended to be higher among those who voted in the previous election, were registered with a major party, were older (but not very elderly), and were part of a two-voter household. Taken together, these control variables predict approximately one-quarter of the variance in voter turnout.

We do not find any significant interactions between these background characteristics and the effectiveness of various get-out-the-vote interventions. For example, augmenting the two-stage least-squares regression model to include interactions between personal canvassing and age, past voting history, and major party registration does not significantly enhance the fit of the model (p > .10).¹¹

Finally, the pattern of main effects we report in Table 5 is amplified somewhat when we use the two-stage probit estimator proposed by Rivers and Vuong (1988) to model the probability of voter turnout. Holding all the covariates constant, the probit regression coefficient of .32 implies that personal canvassing raises turnout from 44.5% (the control group in all experimental conditions) to 57.3%. This change of 12.8 percentage points is somewhat larger than the 9.8 percentage points obtained using least squares. Probit regression also suggests slightly stronger effects for direct mail. Again, taking 44.5% as a baseline, the probit estimate of .02 implies that three mailings increase turnout by 2.5 percentage points. As before, telephone calls did nothing to increase turnout.

Nonlinear models thus reinforce the central finding that personal forms of mobilization tend to be more effective. Consider the effects of mobilizing a set of average households in the control group, whose baseline probability of voting is 44.5%. At fifty cents per

¹¹ When we use all of the covariates to generate predicted probabilities of voting and divide the sample into five groups according to their baseline probability of voting (below 20%, 20–40%, 40–60%, 60–80%, or above 80%), the data do not suggest that personal contact has differential effects across these categories. Granted, the contact rate is much higher for those with the highest propensity to vote (38.7%, n = 2,209) as opposed to those whose likelihood of voting is less than one-in-five (21.5%, n = 7,544), but the effectiveness of personal contact (in logistic units) does not vary significantly. By the same token, we have no evidence that the effectiveness of mail or telephone calls varies depending on the individual's baseline likelihood of participation.

mailer, sending three mailings to each household (containing an average of 1.5 voters) nets roughly one additional voter for each \$40 spent. Similar calculations, using \$1.50 as the cost per personal contact (10 contacts per hour at \$15 per hour), produce an estimate of approximately one more voter for each \$8 spent. To be sure, organizing and supervising a canvassing campaign involves significant fixed costs, but even if the effective marginal costs of canvassing were doubled, face-to-face mobilization would still be cost effective.

CONCLUSION

Due to its size and randomized design, our experiment lends precision and nuance to the extensive literature on voter mobilization. In particular, our findings suggest the importance of differentiating between personal and impersonal modes of political contact. Face-toface interaction dramatically increases the chance that voters will go to the polls. In our study, personal canvassing had a far greater influence on voter participation than three pieces of professionally crafted mail delivered within two weeks of election day. Less effective than direct mail were calls from professional phone banks, 12 Despite our efforts to encourage callers to deliver messages in an engaging, conversational style, the telephone appeals were unmistakably routinized and scripted, and it is possible that recipients detected the fact that the calls were from another state. (The use of out-of-state phone banks in campaigns is by no means atypical. In the New Haven mayoral election of 1999, phone callers had distinctive out-of-state accents.) Whatever personal touch might be conveyed over the telephone undoubtedly diminishes as callers plow through long lists. Our findings concerning voter turnout mirror previous research on blood donation, which shows mail and telephone appeals to be much less effective than face-to-face requests (Jason et al. 1984).

The magnitude of the canvassing effect coupled with the limited influence of direct mail and telephoning lends credence to our hypothesis that falling rates of voter turnout reflect a decline in face-to-face political activity. This hypothesis has been overlooked in previous analyses, which have largely relied on survey data. Surveys rarely draw a distinction between face-to-face and telephone contact; even if they do, they are ill-equipped to gauge the relative effectiveness of personal and impersonal modes. Unlike nonexperimental studies, our research establishes a causal link between canvassing and turnout, and it can survive the charge that canvassing is directed at people with a greater propensity to vote or that the apparent correlation between contact and voting is due to misreports of one or both variables. Contacts were manipulated on a random basis, so that we did not have to rely on respondents to recall whether or how they were contacted. Since the study used public documents to measure voter turnout, none of the experiment relied on self-reports.

Although the size and scope of our study represents a significant advance over previous experimental and nonexperimental research, it leaves certain questions unanswered. First, the messages we employed were strictly nonpartisan. Our findings are consistent with the hypothesis that declines in voter turnout reflect massive retrenchment in the size and vitality of nonpartisan and civic organizations (Putnam 2000), but they speak only indirectly to claims concerning partisan mobilization. Although previous canvassing experiments found both partisan (Miller, Bositis, and Baer 1981) and nonpartisan (Eldersveld 1956) appeals effective, no studies compare the two directly. Whether both types of mobilization have similar effects is thus a question that awaits future experimentation. It may be that the negative tone of certain partisan appeals, particularly when communicated through impersonal means, actually demobilizes certain segments of the electorate, although the evidence is currently mixed (Ansolabehere and Iyengar 1995; Lau et al. 1999).

Second, the small but discernible effect of direct mail implies that the growth in impersonal mobilization may offset some of the decline in personal mobilization. (A similar offsetting pattern may apply to phone banks if, as the results from Adams and Smith [1980] and Miller, Bositis, and Baer [1981] imply, partisan appeals are more effective than the nonpartisan messages we examined.) Our findings are consistent with the notion that declining turnout reflects the disappearance of face-to-face mobilization, but a more thorough understanding of the effects of alternative forms of mobilization is required in order to gauge the historical significance of transformations in both partisan and nonpartisan organizations. In particular, students of electoral politics need to investigate the cumulative consequences of increasing reliance on mail and telephone (as well as the Internet). It may be that over time these modes of contact face the same problem as conversations in a noisy cafeteria: As campaigns must raise their voices louder and louder in order to be heard, voters pay less attention to each message. In 1925, direct mail sent by Harold Gosnell increased turnout by 9 percentage points. Today, the volume of direct mail is vastly greater, and the effect of each piece is much smaller, less than one percentage point per mailer.

Further research also is needed to confirm the generality of our results. It remains to be seen whether they hold in other settings and types of elections, and we are currently engaged in efforts to extend the experiments. Studying the effects of personal canvassing and other forms of contact across different electoral contexts should be viewed as much more than mechanical replication. The distinction we have drawn between personal and impersonal modes of contact suggests the following cross-sectional or cross-temporal hypothesis: Personal contact is more influential when campaigns and organizations emphasize impersonal mobilization. To establish this proposition requires attention to the interaction between the political environment and various mobilization strategies.

Even if our findings have external validity, an impor-

¹² A parallel get-out-the-vote experiment using the same telemarketing campaign in a neighboring city also produced slightly negative effects, based on a sample size of 5,855 in the treatment group and 8,883 in the control group, with similar contact rates.

tant gap remains: We know very little about the mechanism by which personal contact influences voting behavior or why impersonal forms of contact have less effect. Our experiments do not tell us whether personal contact enhances interest in politics, feelings of connectedness to the electoral system, the belief that elections are important, or a sense of obligation to participate. Now that we have a clear indication that canvassing does indeed affect behavior, we plan to augment future experiments with a postelection survey in order to assess the psychological imprint left by canvassers.

Despite limitations, this experiment provides important new clues in the ongoing mystery of why turnout has declined even as the average age and education of the population has risen. A certain segment of the electorate tends not to vote unless encouraged to do so through face-to-face contact. As voter mobilization grows more impersonal, fewer people receive this kind of encouragement. This point is of great practical significance for those who seek to reverse the declining trend in turnout. Many of the recent policy innovations designed to encourage voter participation (e.g., absentee balloting) focus on reducing the costs of voting. Our findings suggest the importance of focusing as well on the personal connection between voters and the electoral process. Face-to-face mobilization efforts have a demonstrable effect on voter turnout. The question is whether the long-term decay of civic and political organizations has reached such a point that our society no longer has the infrastructure to conduct face-to-face canvassing on a large scale.

APPENDIX: DESCRIPTION OF MAILERS

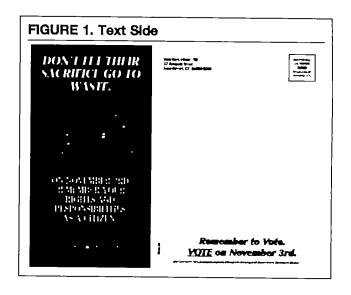

Postcard Texts

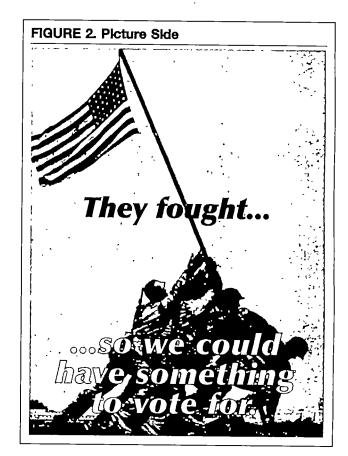

The cards were designed and written (in consultation with the authors) by a professional firm that specializes in political direct mail. All nine cards had the same basic layout. Each was 8×12 and had a different picture that covered the entire front side, with some text superimposed on the picture. The reverse side contained only text. As described below, for each of the three messages, a large portion of the text was the same for all cards in the same message category. A description of the nine cards used in the experiment is provided here, along with the text for each. In addition, we include a reproduction of one card to show the layout.

Civic Duty

The card mailed 8 days before the election is shown in figures 1 and 2. The card mailed 13 days before the election used a picture from the civil rights "March on Washington," of the Washington Monument and the Mall filled with people. The text read: "What Were They Fighting For? They Were Fighting for Our Right to Vote. The whole point of democracy is that citizens are active participants in government, that we have a voice in government. Your voice starts with your vote. On November 3d remember your rights and responsibilities as a citizen. Remember to vote."

The card mailed 15 days before the election had a picture of the first page of the U.S. Constitution. The text read: "We The People... Have a Duty. We have a Duty to Vote." It also carried the same text as the previous card, beginning with "The whole point...."

Neighborhood Solidarity

The card mailed 8 days before the election used a picture of a crowd of people holding up their hands. The text read: "There is Strength in Numbers. Stand Up and Be Counted. When people from our neighborhood don't vote we give politicians the right to ignore us and concentrate their energies elsewhere. But you can make sure that doesn't happen. By joining your neighbors and voting on election day, you'll send a message to our elected leaders: that you care, and that they should care about your concerns. On November 3d Vote to ensure that we are not ignored. Remember to vote."

The card mailed 13 days before the election had a picture of several houses on a city block. The text stated: "Stronger Neighborhoods Start With You. They Start With Your Vote. Our elected officials listen to one thing only—our votes." It also carried the same text as the previous card, beginning with "When people from "

The card mailed 15 days before the election showed people crossing a city street. The text read: "Are Your Values Going to be Represented on Election Day? Only if You Vote." It repeated text from the previous card, beginning with "When people from "

Election is Close

The card mailed 8 days before the election had a picture of two children at a table in a classroom. The text stated: "Their Future Starts with One Vote. Yours. In an election, anything can happen. This year many elections will be decided by only a handful of votes will yours be the deciding vote? Don't miss your opportunity to make a difference, don't miss your chance to make an impact in our elections. On November 3d make sure your vote is included, because no election is ever a certainty and every vote counts. On November 3d don't miss your opportunity to make a difference. Remember to vote.

The card mailed 13 days before the election showed Harry Truman holding up the headline "Dewey Defeats Truman." The text read: "History has Shown the Importance of Your Vote. Vote and Be a Part of History." It used the same text as the previous card, beginning with "In an election '

The card mailed 15 days before the election used a picture of a street sign with an arrow pointing in opposite directions. The text read: "What direction will the country head in? It's up to you and your vote." It carried the same text as the previous card, beginning with "In an election "

Congressional Voting over Legislative Careers: Shifting Positions and Changing Constraints

THOMAS STRATMANN George Mason University

The proposed model predicts that voting behavior of legislators is more variable early in their career and that junior members are more likely to vote with their party than senior members. The results from the analysis of voting patterns in the House of Representatives and the Senate are consistent with the hypotheses: Party line voting and variability of voting decisions decline with increasing seniority. Changes in voting behavior are also induced by redistricting. The empirical results show that legislators subject to redistricting change their voting behavior to accord better with altered constituency preferences.

his article examines changes in voting behavior over legislative careers by contrasting veteran and junior legislators. I also examine variations in voting behavior that follows redistricting and constituency changes.¹

Junior legislators often do not have enough information about what their constituency expects from them and how it will respond to their voting decisions. In a process of trial and error, those decisions are adjusted, which leads to variability in voting records. Guides to voting include party policy and cues from colleagues. As time progresses, however, legislators receive more information about their constituency and rely less on the party line and their colleagues. Thus, their voting behavior may change over time.

One event that may alter voting behavior is a change in constituency caused by redistricting, which can be viewed as an exogenous variation in constituency preferences. Such events allow the examination of legislators' responses to changing constraints, that is, constituency preferences, while holding other legislator characteristics constant. In the absence of such an exogenous change, empirical work faces the problem of distinguishing between legislator and constituency preferences.² In particular, the researcher would not know whether a change in voting behavior is attributable to legislator idiosyncracies or to constituency factors. Redistricting that substantially alters the con-

stituency provides a natural experiment for determining whether legislators change their voting behavior as the result of representing a new electorate.

This article uses roll call voting data from recent election cycles and constructs a panel data set to estimate the parameters of interest. It controls for legislator characteristics and nontime-varying constituency characteristics via fixed effects, as well as for observable time-varying constituency characteristics, and it tests whether changes in seniority and alterations in district boundaries cause alterations in legislators' positions. The results show that voting decisions do change systematically over the course of legislative careers. Early on, legislators follow the majority of their party, but party line voting declines as they gain seniority. In addition, as measured by absolute changes in the Americans for Democratic Action (ADA) voting index, voting behavior is more variable early in careers and more stable as tenure increases. With respect to redistricting, the analysis shows that legislators change their voting behavior to accord with the preferences of the new median voter.

Redistricting provides a way to test for the responsiveness of legislators to changing constituency characteristics. We cannot simply include constituency characteristics in roll call vote regressions because, if voters elect representatives whose beliefs are identical to theirs, we could not determine whether legislators are voting their own preferences or those of the constituency. A test of the effects of redistricting on voting behavior overcomes the bias in the estimated constituency coefficients.

Historically, redistricting has led to an attrition of incumbents, either because they choose not to run or because they lose the election. A loss also may be interpreted as evidence that they were unwilling to adjust their positions. This study helps determine whether the winning incumbents adjusted their positions in response to the new electoral environment.

In the next section I present a model that illustrates the effect of changing constraints on legislators' voting behavior and derive implications about the effect of seniority and redistricting that will guide the empirical work. The empirical models and data sources are discussed in the following section. I then present results, and conclusions are drawn in the final section.

Thomas Stratmann is Professor of Economics, George Mason University, Fairfax, VA 22030-4444.

The author is grateful to Ronald N. Johnson, Ken Koford, Keith Krehbiel, John Lott, Dennis C. Mueller, Michael Munger, four anonymous referees, the APSR Editor, and seminar participants at various universities for their helpful comments.

¹ Previous studies of change in voting behavior over legislative careers include Bernstein 1988; Francis and Kenny 1996; Glazer and Robbins 1985a, 1985b; Grofman, Griffin, and Berry 1995; Grofman, Griffin, and Glazer 1990, 1991; Poole and Daniels 1985; Rothenberg and Sanders 1999; and Thomas 1985. Most of these found no or very little change. Francis and Kenny (1996) show that House members who run for the Senate move to the ideological center in the years before running. Other work addresses whether legislators vote differently in the term prior to retirement (see, e.g., Lott 1990; Lott and Reed 1989).-

² If legislators' preferences are correlated or coincide with constituency preferences, it is difficult to determine unambiguously how constituency preferences affect their voting behavior. A simultaneous equation bias arises when unobserved legislator characteristics are correlated with constituency characteristics and voting behavior.

RESEARCH HYPOTHESES

Implications from Informational Constraints

Just as factory workers learn to perform tasks more efficiently, over time legislators learn about constituency preferences. They acquire this information through trial-and-error voting, election campaigns, and feedback from their electorate. Also, junior legislators are more likely than senior legislators to seek cues on voting from colleagues, because they often have little information about how their votes will affect their reelection chances (Kingdon 1989; Matthews and Stimson 1975).³

The process of trial and error also operates in finding the colleague who gives the best cues. Legislators may follow advice on how to vote that results in disapproval from their constituency. In such cases, they have an incentive to adjust subsequent voting decisions (assuming they want to maximize reelection chances), and this leads to variability in their voting record. In general, if it is assumed that junior legislators have an informational disadvantage, then it follows that they will adjust their position more frequently, and their voting behavior will be more variable than that of senior legislators.

The proposed learning model also has implications for party line voting. Democratic freshmen know that their reelection constituency's preferences are close to the platform of the Democratic Party, and Republican freshmen have similar information about their reelection constituencies. Therefore, legislators who are uncertain about the specific preferences of their reelection constituency have an incentive to vote the party line, because it will be, on average, closer to the position of their reelection constituency than will be the position of the other party. Junior legislators are more likely to be uncertain about preferences and thus have an incentive to vote with their party. They learn about the party position through cues from same-party colleagues (Kingdon 1989).

³ The hypothesis of learning about constituency preferences is drawn from probabilistic voting models. In Downs's (1957) model, candidates know exactly where voters are located in space, and they adjust their platforms accordingly. The probabilistic models assume that candidates are unsure of voter positions and choose a platform that maximizes expected votes. Although the probabilistic framework has not been extended to multiple periods, it is reasonable to hypothesize that winning candidates improve their knowledge about constituency preferences while in office, and they thus have an advantage in choosing their platform in the next election relative to a challenger who has had less opportunity to learn about constituency preferences. Incumbents can adjust their platform and increase the probability of reelection.

⁴ For the influence of parties on congressional voting decisions, see, for example, Cox and McCubbins 1993 and Rohde 1991.

Less informed members have an incentive to take an "average position," rather than an ideologically extreme position. Given the distinct characteristics of the two major parties' constituencies, following the party line in the absence of information is probably the lowest cost way, on average, to make decisions that maximize the chances of reelection. A position that is "typical" for the party or the home district minimizes the likelihood of strong negative feedback from constituents. Although they may start from the party position, as legislators gain more information with increasing seniority, they have an incentive to move closer to the position of the electorate in order to maximize reelection chances.

If legislators learn with increasing tenure that their constituency's position is similar to that of the party, then they will continue to vote along party lines. If they learn this is not the case, then they will break step in order to maximize reelection chances. Therefore, more party line voting is predicted for junior than senior members. This hypothesis is consistent with Kingdon's (1989) finding that cues come heavily from own-party members, but senior legislators also turn to informants outside their party, which in turn may lead to less party line voting. The hypothesis that junior members have an informational disadvantage is also consistent with evidence from the 1960s that they tried to "learn the process" by relying on more senior members for information (Fenno 1966).

Some institutional features of the U.S. Congress also may prompt junior legislators to vote along party lines. Party support is important not only for winning an election but also for obtaining committee assignments, which are decided by each party's congressional caucus.8 Partisan criteria determine that process (e.g., Rohde and Shepsle 1973), and legislators who vote with the party are more likely to obtain coveted assignments. In addition, leadership endorsement is important (Shepsle 1978), and legislators who vote more often with leaders have a higher probability of being transferred to preferred committees (Coker and Crain 1994; Cox and McCubbins 1993). Sinclair (1995) reports that in nominating speeches for exclusive committees, the nominee's party loyalty is praised by the leadership. In summary, empirical findings and anecdotal evidence show that it pays for legislators to vote with their party and its leaders if they want an exclusive committee assignment. Once it is obtained, however, promotion to higher ranks in the committee is via the seniority rule. Because senior legislators do not have to rely on their party for promotion, they are less dependent on party approval than are junior members, who are still seeking preferred assignments or transfers. Therefore, the incentive to vote along party lines weakens with increasing seniority.9

⁵ Democratic and Republican legislators come from significantly different constituencies (Kingdon 1989; Stratmann 1996), so their voting decisions differ.

⁶ Truman (1959) hypothesizes that junior legislators stay close to the orthodox party position because they are new to the chamber.

⁷ The party leadership is perhaps not a major influence on voting decisions, at least to the extent of forcing a legislator to vote against his or her constituency, but it has an informational advantage relative to junior legislators, especially on issues of low salience. Consequently, the leadership may have some influence on junior members' voting decisions.

Before 1910 (the Cannon revolt) the Speaker made all majority and minority party assignments.

⁹ The predictions from this model and the information-based model are in contrast to the model that postulates voters elect ideologues (i.e., legislators with fixed platforms). In other words, legislators' voting behavior is fixed, and no changes occur over time.

Implications from Downs's Median Voter Model

Downs's (1957) model, which is based on the key assumption that candidates will maximize their chances of reelection, has implications for voting behavior. Candidates are political chameleons who adopt whatever position is necessary to win the maximum number of votes. The model predicts that the voting decisions of incumbents are a function of the preferences of their constituency, not of the representatives themselves. The link between constituency preferences and legislative voting decisions is broken once a legislator is freed from reelection constraints.

Incumbents typically do not seek election in different districts, but redistricting, which changes geographical boundaries, offers an opportunity to test the Downsian hypothesis. The Downsian framework also implies that legislators will change their voting behavior in accord with preferences of their electorate and will adjust their platform if redistricting results in constituency preferences that differ from those of the old district. In the previous section, it was assumed that junior legislators' knowledge of their constituency grows at a decreasing rate over time. The Downs model suggests that legislators have perfect knowledge of their constituency as soon as they run for election in a new district. Although the Downs model and the learning model both predict that voting behavior will change upon redistricting, the Downs model predicts a full adjustment in the election cycle immediately after redistricting, while the learning model implies an adjustment over several election cycles. The median voter is the theoretical basis for both models, but the predictions of the informational model are based on cue-taking and on the hypothesis that reelection constituencies differ between the two parties, whereas Downs focuses on the median voter of the entire constituency. Empirical evidence shows that roll call vote decisions are influenced by the preferences both of the reelection constituency and the median voter (Stratmann 1996).11

EMPIRICAL MODEL AND DATA

The models in the previous section predict that legislators change their voting behavior over time. The hypothesis that junior legislators are less likely to vote with the party as they gain tenure is tested with the following:

PartyVote_{$$\mu$$} = β_1 Seniority _{μ} + $\beta_2 X_{\mu}$ + μ_i + γ_j + ϵ_{μ} , (1)

where the unit of observation is legislator i in cycle j. PartyVote is the party unity measure of the Congressional Quarterly Almanac. This variable is calculated from votes in which the majority of Republicans oppose the majority of Democrats, and it measures the percentage of roll call votes in which legislators side with their party majority. Two measures of the party unity vote are used. In the first, failure to vote lowers the score. In the second, failure to vote does not lower the score. As does the literature that measures the frequency of "yes" votes, I will use the minimum χ^2 method to estimate the regression model (see, e.g., Greene 2000; Kalt and Zupan 1984). ¹² Covered in this analysis are each election cycle from 1983–84 to 1993–94.

Equation 1 states that party line voting is a function of seniority, legislator indicators (μ_i) , year indicators (γ_j) , and constituency and legislator characteristics that change over time (X_{ij}) . The seniority variable is measured as a logarithmic transformation of the number of election cycles a legislator has served in Congress, because the incentive to vote with the party leadership should diminish for a legislator over time. The proposed model predicts a negative coefficient on seniority.

Legislator fixed effects (μ_i) in equation 1 control for observed and unobserved characteristics of legislators as well as constituencies. Because a district can be represented by more than one legislator over the election cycles analyzed, legislator fixed effects subsume district fixed effects. They also allow for some change in constituency preferences at the date of the turnover from the previous to the new representative. For example, if one legislator represents a specific district in the first years and another represents the same district in later years, two fixed effects are associated with that district. Year cycle effects (γ_I) control for particularities in each session of Congress. The X_n vector includes an indicator for redistricting, an indicator for legislators who have announced retirement, the percentage of the popular vote received in the general election, and constituency characteristics that change over time.

The effect of the percentage of the popular vote on party unity is ambiguous. Unlike competitive seats, a safe seat makes party line voting low risk, because a loss of some votes is less likely to spell defeat in the general election. Thus, legislators with safe seats may cast more party line votes. Yet, safe seats require less financial help from the party, and this independence may lead to less party line voting.

Since unobserved or unmeasured constituency characteristics can create safe seats and also can lead to high party line voting, the percentage of votes received by the legislator or party in the general election may be endogenous in equation 1. Although this variable is not of central interest here, I correct for the potential

¹⁰ Studies on the relative importance of legislator ideology and constituency preferences include Bender 1991; Bullock and Brady 1983; Coates and Munger 1995; Dougan and Munger 1989; Kalt and Zupan 1984, 1990; Kau and Rubin 1979; Levitt 1996; Lott 1990; Lott and Davis 1992; Peltzman 1984; Poole and Romen 1993; Poole and Rosenthal 1985, 1997; and Zupan 1990. A partial list of research on other issues surrounding roll call votes includes Amacher and Boyes 1978; Crain, Leavens, and Tollison 1986; Fiorina 1974; Kingdon 1989; Krehbiel 1991; Snyder 1992; and Stratmann 1995, 1996.

¹¹ Stratmann's (1996) measure of reelection constituency preferences is the residual from a regression equation that explains legislators' party affiliation. This residual explains differences in legislators' voting behavior.

¹² The robustness of this specification is examined in the next section.

endogeneity by including the predicted general election percentage of the popular vote for each candidate, rather than the actual percentage in the party unity regressions, by following a two-stage least-squares procedure. The rank of the percentage serves as the instrument (Koenker and Bassett 1978).¹³

Redistricting may affect party line voting because it implies a new constituency. In my sample, redistricting occurred for the 1992 election. Legislators are classified as running in a different district if the geographic area is more than 50% different from previous boundaries.¹⁴ For these legislators, the redistricting variable equals 1 in the 1993-94 cycle, 0 otherwise. The net effect of the redistricting indicator on party line voting in equation 1 is not predictable,15 except in some special cases. For example, if a Republican legislator's constituency is more conservative after redistricting. s/he may vote more often with the party than previously. Nonetheless, more party line voting is not necessarily implied by this example. Because that constituency could now perhaps be less typical for the Republican Party, less party line voting could result. To test whether changed preferences of the electorate alter a legislator's voting behavior, I estimate a modified version of equation 1:

PartyVote_n =
$$\beta_1$$
Seniority_n + $\beta_2 X_\mu$
+ β_3 (Redist Δ PresV_n) + β_4 (Redist Δ PresV
× Republican_n) + μ_1 + γ_1 + \in_n .

(2)

Redist $\Delta PresV_{j_1}$ measures the change in the presidential vote in each congressional district affected by 1992 redistricting, that is, its percentage of the electoral vote for Clinton in November 1992 minus the corresponding percentage for Dukakis in 1988 (calculated as 100 minus the district percentage received by Bush). Since this variable is designed to measure the change in constituency preferences associated with redistricting, it is zero for the years before 1993. Large positive values of Redist $\Delta PresV_{j_1}$ indicate more liberal preferences. The coefficient β_3 is predicted to be positive: Democrats are more likely to vote with their party if their constituency becomes more liberal due to redistricting. The sum of β_3 and β_4 is predicted to be negative: Republicans are less likely to vote with their party if their constituency becomes more liberal.

The information-based voting hypothesis predicts less variability in voting records and less party line voting as seniority increases. The Downsian model predicts a change in voting behavior when district boundaries change and when the preferences between the old and new constituencies differ. Furthermore, the direction of the change is predicted: Legislators who run in more liberal districts will cast more liberal votes after redistricting. Equations 3 and 4 test these hypotheses.

ABS(
$$\Delta \text{Vote}_{\pi}$$
) = $\beta_1 \text{Seniority}_{\pi} + \beta_2 \text{Redistricting}_{\pi} + \beta_3 X_n + \mu_7 + \in \pi$. (3)

 $\Delta Vote_n = \beta_1 Seniority_n + \beta_2 (Seniority_n \times Republican)$

+
$$\beta_3(\text{Redist}\Delta\text{MedInc}_{\mu}) + \beta_3 X_{\mu} + \mu_i + \in_n$$
. (4)

The $\Delta Vote_{ii}$ variable measures the change in voting behavior from one election cycle to the next.16 The change is calculated as the difference in a legislator's ADA rating. This was selected because of its frequent use in previous studies, and it is the only rating that adjusts for "inflation" and "stretching" (Groseclose, Levitt, and Snyder 1999). The adjustment corrects for the changing rating mean over time, so no cycle effects are required in the estimation. The rating ranges from 0 to 100, and a lower score indicates a more conservative legislator. The ADA score is measured in two ways. In the first, failure to vote lowers the score. In the second, failure to vote does not lower the score. I will focus in the results section on the second measure, which seems the most pertinent for this analysis.17 Moreover, I will focus on the ADA scores of the first session of each Congress. Legislators become aware of any new boundaries in the second session of Congress preceding the first election with redistricting. This knowledge may give them an incentive to alter their voting behavior in the second session (Rothenberg and Sanders 1999). In this case it is preferable to compare the voting records of 1991 (the first session of the 102d Congress) to those of 1993 (the first session of the 103d Congress), as I do here.

The seniority variable, the redistricting indicator, the X_{ji} vector, and the legislator fixed effects, μ_{ij} , are defined as previously. Covered by this analysis are election cycles from 1983–84 to 1993–94.

In equation 3, the dependent variable ABS(ΔV ote_{μ}) is the absolute value of the change in ADA ratings from election cycle to election cycle, and β_2 is predicted to be positive.¹⁸ In equation 4, larger values of

¹⁵ Percentages are ordered from highest to lowest and divided into three equally large groups. A rank of 1 is assigned to the highest group, a 2 to the middle group, and 3 to the lowest group. By construction, the rank is positively correlated with the percentage; if a change in the percentage does not alter the rank, the rank is independent of the error term in the second stage. A low number of ranks, as used here, reduces the likelihood of such a correlation

¹⁴ Using the congressional district maps of the U.S. Department of Commerce, which show the geographic areas in the 1980s and 1990s, I visually examined whether the boundaries changed by more than 500c.

¹⁵ Redistricting increases uncertainty about new constituency preferences, which gives the legislator an incentive to take cues from the party. Most legislators who experienced redistricting in this sample were more senior, however, so they already had learned how to assess efficiently the opinions of constituents. The mean number of cycles for legislators who were not redistricted is 3.6, compared to 5.9 for redistricted legislators. The difference in means is statistically significant at the 1% level.

¹⁶ Relative to equations 1 and 2, the number of observations is reduced in equations 3 and 4. Since I examine the change in the constituency preferences from one cycle to the next for a given legislator, the legislator has to be in Congress in two adjoining cycles. ¹⁷ I will note in the next section whether the results presented are robust when I use the inflation-unadjusted scores and when I use the inflation-adjusted but not absence-adjusted scores.

¹⁸ One particularly important factor diminishes the magnitude of the redistricting coefficient. If a district is divided into two by redistricting, the incumbent has a choice about the one in which s/he will run. Legislators have an incentive to select the district most likely to elect them. In this case the effect of redistricting on their voting behavior

TABLE 1. Data Description of Variables Used in the Regression Analyses: Means (Standard Deviations)

Overall change in median household income in 1993-94d		2,584 (3,975)

Note. The unit of observation is a legislator in a given election cycle. The data cover stx two-year election cycles ranging from 1983-84 to 1993-94. For the Senate there are 1,168 observations for the unadjusted party unity variable and 778 observations for the adjusted unity variable. Except for the ADA variable, the descriptive statistics are based on 1,168 observations. The number of observations on the change in the Senate ADA rating is 432. For the House, there are 5,148 observations for the unadjusted party unity variable and 3,418 observations for the adjusted unity variable. Except for the ADA variable, the descriptive statistics are based on 5,148 observations. The number of observations on the change in the House ADA rating is 1,819. Income is expressed in real 1985 dollars.

Data were obtained from Americans for Democratic Action.

b Data were obtained from annual neues of Congressional Quarterly Almanac from 1983 to 1994.

The redistricting variable is constructed as described in the text.

the dependent variable, $\Delta Vote_{jl}$, imply a more liberal position. Redist $\Delta MedInc_{jl}$ measures the change in the median household income from cycle to cycle, ¹⁹ and the Republican variable is defined as equaling 1 if the legislator is from the GOP, 0 otherwise. The β_1 coefficient measures the change in voting behavior of Democratic legislators (equation 4), the sum of β_2 and β_1 measures the change in voting behavior of Republicans, and β_3 measures the change in voting behavior due to redistricting. The Downsian model predicts that β_3 will be negative: As median district income increases, legislators who run in districts with altered boundaries will vote less liberally.

Between the 1980s and the 1990s the U.S. economy expanded, and the median income in all districts increased. To account for this trend, the RedistAMedInc variable measures the change in income in reapportioned districts relative to the average change in districts that were not redrawn. This variable is expressed in dollar amounts. An alternative measure for the change in constituency preferences due to redistricting will be the percentage change in median income in redrawn districts, again deflated by the

average percentage change in median income. This variable is expressed in percentage terms.²⁰

The analysis of how redistricting affects voting behavior only applies to the House of Representatives, not the Senate. Senators do not face redistricting and run for reelection less frequently than House members. Consequently, they have fewer reelection constraints and are considered more independent from their party. Although these facts may imply that the predicted career changes in voting pattern are less strong for the Senate than for the House, similar but perhaps weaker effects are predicted for the Senate. Therefore, I will test whether the voting patterns in the Senate are similar to those in the House.

Data for the analysis were obtained from annual issues of the Congressional Quarterly Almanac dating from 1983 to 1994 and from the 1980 and 1990 Census of Population and Housing, published by the Bureau of

Data were obtained from the 1980 and 1990 Census of Population and Housing, Bureau of the Census, U.S. Department of Commerce.

is smaller than when they have no choice about the district in which to run.

¹⁹ It remains zero when there is no redistricting but takes positive or negative values for the 1993–94 election cycle.

²⁰ The income measure is adjusted for income growth; relative income, as opposed to absolute income, is more likely to determine whether a person is liberal or conservative. The change in the presidential vote is not adjusted in this manner because I expect that absolute levels of conservative or liberal district sentiments (measured by the presidential support variable) are likely to influence legislators' voting decisions. I will examine, however, whether the results are robust when I adjust the presidential support variable in a similar way to my adjustment of the income variable.

TABLE 2. Differences in Party Unity Averages by Seniority

the Census, U.S. Department of Commerce. Means and standard deviations of all variables are reported in Table 1 and the Appendix.

RESULTS

As a first step in the party line vote analysis, Table 2 shows various levels of party unity voting for three groups of legislators of roughly equal size. In one group are the most junior legislators, in Congress for one to three election cycles; in the second group are legislators with four to six cycles of seniority; and in the third group are the most senior members of Congress. Comparison of party unity averages reveals that junior members are more likely to vote with the party than are senior members. The fourth column of Table 2 shows that these differences are statistically significant.

At first glance it appears odd that the senior legislators, who seemingly represent what the party stands for, are less likely to vote along party lines. This raises the question of who is "the party." The issue can be resolved by recognizing that the party unity measure is closely correlated with the party leadership measure and essentially is a leadership measure (the percentage of identical legislator/party leadership voting). The correlation coefficient between the two is 0.98 in 1986. Thus, to a large extent the party unity measures indicate the frequency with which legislators vote with their leaders, and unity scores should be higher for legislators who are leaders than for legislators who are not leaders. Table 3 shows a higher unity score for the leadership than for the average legislator. The difference in scores between leaders and nonleaders in the House is statistically significant at the 5% level. The difference in scores between leaders and nonleaders in the Senate is somewhat smaller. This finding is consistent with the hypothesis that leaders are "the party," as opposed to nonleaders or senior members in general.²¹

TABLE 3. Differences in Party Unity Averages between Leaders and Nonleaders

	Leaders	Nonleaders	t-Test for Equality of Means
House	84 1 (7.7) [48]	78.0 (18 <i>-2</i>) [5,120]	5.3
Senate	81.1 (14.9) [48]	77.4 (15.0) [1,140]	1.73

Note: Standard deviations are given in parentheses. Number of observations is given in brackets. For each party, the leader and the whip are defined as leadership. The reported means are the unadjusted party unity scores. Results for the adjusted unity scores are very similar to the reported scores.

The first two columns of Table 4 show the effect of seniority on party line voting for the House of Representatives. The findings support the proposition that representatives are less likely to vote with their party majority as seniority increases. As a robustness check, I replaced log seniority with separate indicator variables for legislators with one, two, three, and four cycles in Congress. The coefficients on the seniority indicators are positive, are statistically significant, and decline monotonically with higher levels of House seniority, which indicates that junior legislators are more likely to vote with the party. For example, the estimated coefficients on freshmen in the adjusted unity regressions imply that their unity scores are approximately 22% higher than the party unity measures for legislators with more than four cycles in Congress. The results in Table 4 are robust, regardless of whether the adjusted or unadjusted party unity scores are examined.22 The results were also similar when I followed one class of legislators over the course of their career. In particular, I examined the voting behavior of the 1983 freshmen, and the findings were very similar to those reported in Table 4.

The negative effect of seniority on party line voting cannot be explained by some omitted variables that are fixed over a career, since all constituency preferences that are constant throughout a legislator's tenure are controlled via legislator fixed effects. Moreover, the results are essentially the same if the regression analysis focuses only on the period before redistricting, which means that some unobserved change due to redistricting cannot account for the findings either. They could be explained, however, through a model that stipulates systematic change in constituency preferences, such that the electorate prefers less party line voting as the tenure of their representative increases. What might cause such a shift in preferences, however, is not obvious.

The model makes no predictions about the influence of redistricting on party loyalty, and the findings show that redistricting does not affect party line voting. Impending retirement leads to less unity voting in the absence-unadjusted regression, which is caused by lower attendance rates of legislators in their last term (Table 4, column 1).²³ Yet, legislators in their last term are more

²¹ That junior members have higher party unity scores than senior members does not mean they are leaders. Leaders are drawn from senior members (in this data set, leaders have average tenure of nine election cycles), but of course they are a very small subset even of senior members (48 of 1,188 senators in this sample and 48 of 5,168 members in the House).

²² An alternative specification of the regressions underlying Table 3 is to calculate the average unity rating per cycle and use this as the unit of observation. The regression results were very similar, qualitatively and quantitatively.

²³ Lott (1990) shows that average attendance rates are lower for legislators in their last term. The unadjusted party unity score counts

Note Since I examine the change in the presidential vote from cycle to cycle in a legislator's district, some observations are lost, but 4,407 (3,168) observations remain. The overall mean (standard deviation) for the change in the presidential vote is -.78 (4.07), for the 1993-94 cycle, the corresponding numbers are -4.69 (9.02). Standard errors are given in perenthesis.

* Absence lowers acores, **Adjusted for absence

This variable measures the 1992 percentage of the popular vote in a congressional district received by Clinton minus the 1988 percentage of the popular vote in a congressional district received by Dukakle.

b This variable is defined as the "change in presidential vote"-variable, and is interacted with a indicator which equals one if the legislator is a Republican and zero if the legislator is a Democrat.

a repulsional and zero if the special as a believe at a serior at a serior

likely to vote along party lines once the dependent variable is corrected for absences, and the corresponding coefficient is statistically significant at the 10% level (Table 4, column 2). In sum, legislators in their last term are absent on a significant number of party line votes, but when they vote, they are more likely than their colleagues to side with the party. Finally, a higher winning percentage in the previous general election is associated with more party line voting, but for the most part these coefficients are not statistically significant. To save space, the coefficients on the eight constituency variables (see Appendix) are not reported, since these are of little interest in this analysis.

The last four columns of Table 4 show the results from the Senate party unity regressions. The results on log-seniority reveal that senators, similarly to House

failure to vote as a vote against the party. Thus, scores for retiring legislators who fail to attend roll calls but who vote with the party on all other occasions are lower than for legislators who vote with the party and attend all votes.

members, are less likely to vote along party lines as they gain seniority. The last two columns have indicator variables for specific amounts of seniority. The omitted category is legislators who have spent more than four two-year House election cycles in the Senate. The indicator variables in the adjusted unity regressions reveal an interesting pattern. Senators in their first two cycles and in their fourth cycle vote more along party lines than legislators with five or more cycles.²⁴ Senators in the third two-year cycle, the one in which they run for reelection, adjust their voting behavior significantly: They vote the same as legislators with more than eight years in the Senate. For the adjusted unity score, a t-test for the equality of coefficients shows that party line voting in the third cycle is significantly lower than in the second and fourth cycle.25 Interestingly, after the election is won, senators are more likely to vote with the party than they were in the previous two years.26 It appears that the upcoming general election gives senators an incentive to adjust their voting behavior in the direction of more independence from party influence.27

Table 5 shows the regression results that correspond to equation 2. They reveal that legislators alter their party line voting in response to changing constituency preferences. When redistricting makes the constituency more liberal, Democrats are more likely to vote with their party, and Republicans are less likely to vote with theirs. The coefficients imply that a 1% increase in the presidential vote for the Democratic candidate makes House Democrats 1.3% more likely to vote with their party, whereas House Republicans are 1.8% less likely to vote with theirs. The findings on retirement, seniority, and the other explanatory variables are consistent with the results presented in Table 4.

Before presenting the ADA regression results that correspond to equations 3 and 4, I will examine how the median income variable in these regressions relates to party affiliation and redistricting. The Downsian model predicts that legislators who represent a more liberal redrawn district will have a more liberal voting record. I use median income as a measure of constituency preferences because that is a good predictor of

²⁴ Freshmen and sophomore senators are also most likely to vote along party lines, as measured by the unadjusted unity score, and there is an increase from the first to the second cycle, although the difference is not statistically significant. This finding may be due to some "measurement error" in the unadjusted score.

²⁵ Previous work on the effect of Senate elections on senators' policy positions includes Elling 1982; Fenno 1982; Hibbing 1984; and Thomas 1985. Wright and Berkman (1986) examine the effect of policy issues on the selection of members of Congress.

policy issues on the selection of members of Congress.

To test for robustness of the results, I ran the regression with data only on the second session of an election cycle. The coefficients on log-seniority were negative and statistically significant at the 1% level, and the indicators for seniority revealed a similar pattern.

²⁷ The finding of increased loyalty after reelection indicates that senators are aware of their constituency preferences, that they trade off party unity against constituency support, and that the trade-off changes as election nears. Thus, in addition to informational constraints, this trade-off is another important determinant of voting behavior.

^{**}The results are robust regardless of the change in the presidential vote for the Democratic candidate or the "deflated" change, that is, when I control for the fact that, on average, the percentage received by the Democratic candidate in 1992 was lower (because of the three-way race among Clinton, Bush, and Perot) than in 1988.

party affiliation, the likelihood of a liberal legislator being elected by the district, and his subsequent voting behavior. In this sample, the median household income in districts represented by Republicans was approximately 12% higher than in districts represented by Democrats (\$24,000 versus \$21,500). A simple t-test for differences of means revealed a statistically significant difference at the 1% level. Republicans also have a significantly lower ADA rating than Democrats. The correlation between the ADA rating and median income was -0.10, which is statistically significant at the 1% level. Thus, it appears reasonable to use median income as a measure of whether an electorate becomes more liberal after redistricting.

As noted previously, I created an indicator for those legislators whose district boundaries changed by more than 50%, and 94 representatives fell in this category. I then compared the change in median income before and after redistricting (in districts which had boundaries altered by more than 50%) to the change in median income in all other districts. A t-test showed that the change in absolute median income for the redrawn districts was significantly larger than for the other group (Table 1).29 This test examines the absolute differences because approximately half the legislators ran in a new district with a lower median income than the one they represented previously, when one controls for the general growth in income over the decade.³⁰ In sum, they represented a significantly different constituency relative to their previous district.

The first four columns of Table 6 look at voting variability. They show the results that correspond to equation 3, which uses the absolute change in the ADA rating as the dependent variable. The first two columns relate to the House, the third and fourth to the Senate. In the House, variability declined as seniority increased, which is consistent with the hypotheses outlined above. In the Senate regressions for vote variability (Table 6, cols. 3 and 4), the coefficients on

²⁹ The median income in nonreapportioned districts grew somewhat between 1983 and 1993. log-seniority are negative, and it is statistically significant in column 3, which implies that senators' vote variability declines as seniority increases.³² No coefficient on redistricting is reported in the Senate equations because state boundaries do not change.

For variability of voting, all the coefficients on the redistricting variable are positive, and they are statistically significant in all specifications. It was expected that inclusion of constituency variables would lower the magnitude of the coefficient on redistricting in column 2, because those variables capture some of the changing composition of the district. The results support the hypothesis that legislators adjust their platform in response to the altered preferences of their constituency.³³ In this case, the preference change is caused by redrawing the district boundaries. The mean absolute ADA rating change from cycle to cycle is 8.2. Thus, the coefficient on redistricting implies a change in legislative voting behavior of about 25% relative to the mean of the dependent variable.

The coefficients on the retirement indicators are not statistically significant. Therefore, the outgoing legislators did not miss a significant number of ADA votes; if they had, their ADA scores would have been lower, and this would have been detected by the regression analysis.³⁴

To save space, the coefficients on the eight constituency variables (see the Appendix) in Table 6, columns 2 and 4, are not reported. None was statistically significant, which is not surprising since the model includes legislator fixed effects, and the only variation left in the constituency variables is due to redistricting.

Columns 5 and 6 of Table 6 answer the question of whether the change in legislative voting behavior is consistent with altered preferences in redrawn districts. The dependent variable in these columns is the net change in the ADA rating, which indicates the direction of change. Legislators whose new district has a higher median income than the old vote more conservatively, which supports the hypothesis that they adapt to the preferences of their constituency.³⁵ The coefficient on median income in Table 6, column 5, implies

²⁰ Even accounting for growth in income, one-fifth of the legislators subject to redistricting represented a new constituency with a median income in 1990 lower than the 1980 median in their old district.

³¹ The qualitative results hold, regardless of whether the standard errors are estimated via least squares or a robust estimator of the variance-covariance matrix. Also, the results are similar when the dependent variable is the inflation-unadjusted ADA measure or the absence-unadjusted ADA measure. As a robustness check, I substituted indicator variables for legislators with one to five years of semority. The omitted category was legislators with more than five years' seniority. The results supported the hypothesis that voting behavior is more variable among junior than senior legislators. Substantial change occurred between the first and second term in Congress, and the change from the second to the third term was greater than in subsequent terms. Testing for equality of the seniority indicator coefficients revealed a significantly greater coefficient on the freshmen indicator than on the two-, three-, and four-cycle seniority indicators. In addition, the coefficient on the sophomore indicator was significantly larger than the coefficient for three-term members of the House.

This result is also consistent with a model that posits the development by legislators of specific positions favoring or opposing particular special interests over time (Kroszner and Stratmann 1998, 1999). Thus, voting behavior is variable early in their career, when they are determining with which interest to ade, and variability declines once this decision is made.

²² The results are less strong in the Senate than in the House when I include individual seniority indicators in the regression equation. ²³ This result is consistent with the finding by Glazer and Robbins (1985b) for the 1970s and 1980s and by Rothenberg and Sanders (1999), who use a different method and do not control for legislator-specific characteristics via fixed effects.

³⁴ If junior members who lose reelection or, alternatively, decide to retire have a more variable voting record, then the results on the seniority variable would be due to a selection bias. Because of this concern I estimated the regressions in Table 6 only with those legislators who ran for reelection and won. The results were quantitatively and qualitatively very similar to the results reported.

 $^{^{25}}$ I estimated the model with two median income variable specifications. In one, the median income variable takes only nonzero values for districts whose boundaries changed by more than 50%. In the others, I examined the change in median income for all districts because almost all had at least some boundaries redrawn. The results were robust in both cases. The *t*-statistic was a bit smaller in the first specification, but the results were statistically significant. The second specification is reported in Table 6.

A similar finding was obtained when the presidential vote was substituted for median income The absolute difference in the presidential vote share (for Clinton in 1992 versus Dukakis in 1988) was significantly larger in districts more than half redrawn than in

Noter Robust standard errors are given in perentheses. At ratings are "inflation" adjusted according to Grosectose, Levitt, and Snyder (1999) and absence adjusted.
In the first four columns, the dependent variable is the cycle-to-cycle absolute change from the first assesson's ADA rating, measured as the absolute of the difference in the ADA accres between two adjoining

election cycles
In the last two columns, the dependent variable is the cycle-to-cycle difference in the ADA acces implies that the legislator has a more liberal voting record. Thus, if the ADA difference is positive, the number indicates that the legislator adopted a more liberal position. If it is negative, the legislator adopted a more conservative position.

Each House regression has 666 legislator fixed effects and 1,819 observations. The mean (attandend deviation) for the Republican variable is 0.3864 (0.4824). The Senate regressions have 441 observations and 126 legislator fixed effects.

that when this increases by \$1,000, the legislator's ADA rating drops by .7 points.³⁶

The results on log-seniority imply that, from their first cycle in the House, Republicans vote more conservatively and Democrats vote more liberally. But the coefficients also suggest that both develop more extreme voting behavior over time (Table 6, cols. 5 and 6). The results are consistent with the view that first-term legislators, lacking sufficient information about how to vote on each issue, take "average" positions. With increasing seniority, they move away from this "average" position.³⁷

CONCLUSION

This, article investigates whether legislators change their voting behavior over the course of their career.

districts with no or little boundary change. Moreover, when the new constituency is more liberal (measured by the presidential vote), legislative voting behavior becomes more liberal, as measured by changes in the ADA ratings.

³⁷ The results are very similar when the inflation-adjusted, but not absence-adjusted, ADA scores are used in the regression analysis. They also are similar when the noninflation-adjusted ADA scores are used, but the coefficients are not quite as precisely estimated.

³⁷ Estimating the models in the last two columns of Table 7 reveals that the variability in senators' voting behavior is not caused by a systematic move to the extremes, as in the House, but by unsystematic changes.

The analysis of party unity votes shows that junior legislators are more likely to vote along party lines than senior legislators. With increasing tenure, senators as well as representatives vote less along party lines. These results are consistent with the hypothesis that junior legislators rely more on their party for voting advice and with the hypothesis that they are more susceptible to party pressure than are senior members.

Redistricting is an event that affects a subgroup of legislators and is one potential cause for changes in voting behavior. It is also a natural experiment that allows us to test the Downsian hypothesis that legislators alter their voting behavior in response to changes in constituency preferences. The results show that this is the case in the House of Representatives. When districts become more conservative, House members tend to become less liberal in their voting.

In summary, legislators change their voting behavior over the course of their career. Their voting decisions are shaped by responsiveness to their constituency and by legislative seniority. This article stresses an informational rationale for changing party line voting and for variability in voting behavior. Future research should explore the relative importance of informational constraints, changing constituency preferences, leadership and party pressure, and institutional arrangements in explaining variable voting behavior throughout legislators' careers.

APPENDIX: Constituency Variables: Means (Standard De-	vlations)	<u>, '</u>
	Senate	House
Percentage of population over 65 years	11.69 (2.12)	11.91 (3.29)
Percentage of population with college education or more	17.87 (3.27)	18.10 (7.46)
Percentage of population employed in manufacturing industry	21.59 (7.77)	[,] 23.40 (8.42)
Percentage of white population	84.70 (11.76)	81.93 (17.89)
Median household Income	\$22,702 (4,291)	\$26,189 (5,520)
Percentage of blue-collar workers	30.84 (4.40)	30.41 (7.70)
Percentage of home ownership	63.59 (5.18)	61.98 (13.06)
Percentage of urban area	67.57 (14.53)	.74.40 (22.25)

Note: The unit of observation is a state for the Senate and a congressional distinct for the House. Means are calculated from levels of constituency characteristics spanning the 1983–84 to 1993–94 election cycles. Data were obtained from the 1980 and 1990 Census of Population and Housing, Bureau of the Census, U.S. Department of Commerce.

Buying Supermajorities in Finite Legislatures

JEFFREY S. BANKS California Institute of Technology

analyze the finite-voter version of the Groseclose and Snyder vote-buying model. I identify how the optimal coalition size varies with the underlying preference parameters; derive necessary and sufficient conditions for minimal majority and universal coalitions to form; and show that the necessary condition for minimal majorities found in Groseclose and Snyder is incorrect.

common feature of numerous rational choice theories of politics, such as the size principle of Riker (1962) or the stationary equilibria of Baron and Ferejohn (1989), is that minimal winning coalitions are likely to form. This prediction runs counter to the empirical regularity that such coalitions are rarely if ever observed (Browne 1993). To remedy this situation Groseclose and Snyder (1996) develop a model of competitive vote buying in which the equilibrium path of play, for certain parameter values, has one group bribing a supermajority of voters and the second group bribing no one; the supermajority votes in favor of the policy preferred by the former group, whereas a simple majority would have sufficed. The incentives underlying this apparently excessive vote buying are found in the sequential structure of the moves: One group bribes a sufficiently large number of voters at the first stage so as to prevent a successful bribe attack by its opponent at the second stage. That is, the pressure to build a supermajority coalition is driven by the "unseen" competitive response that would have occurred had the first group attempted to secure only a bare majority.

Most of the analysis in Groseclose and Snyder (1996) assumes a continuum of voters, which makes certain types of results easier to identify but others more difficult. In particular, their characterization of the optimal coalition size requires the stringent assumption that voter preferences are linearly related. This assumption is also present in their one finite-voter result, on the optimality of minimal majority coalitions. I will consider only the finite-voter model and replace the linearity assumption with a bound on voter preferences. Using fairly elementary methods, I will generate a characterization of the optimal coalition size and identify how this size varies as the underlying parameters of the model change. I show that the optimal coalition size is weakly increasing in the value voters place on the winning group's preferred alternative. That is, as voter preferences shift in favor of that alternative, the winning group does not decrease, and may actually increase, the number of voters bribed. I also show that the result of Groseclose and Snyder

(1996) on the optimality of minimal majorities is not correct.

THE MODEL

There are two alternatives (x and y), two interested parties (A and B), and a set $N = \{1, \ldots, n\}$ of voters, with n assumed odd. Party A prefers x to y and is willing to pay up to $W_A > 0$ to see the former prevail; B prefers y to x and is willing to pay $W_B > 0$. For each $i \in N$, let $v_i \in \Re$ denote the intensity of i's preference for voting for x over y, measured in money, and let $\mathbf{v} = (v_1, \ldots, v_n)$ denote a preference profile. Thus, voter preferences are defined by how they vote rather than by the alternative that prevails; $v_i > 0$ means that i prefers x to y, and $v_i < 0$ means that i prefers y to x. Since the voters are indistinguishable to A and B save for these preference intensities, without loss of generality I can restrict attention to preference profiles of the form $v_1 \geq v_2 \geq \cdots \geq v_n$.

The sequence of decisions is as follows. Initially, A offers a bribe schedule, $a=(a_1,\ldots,a_n)\in \Re_+^n$, after which B, with knowledge of a, offers a bribe schedule, $b=(b_1,\ldots,b_n)\in \Re_+^n$. All $i\in N$ vote for either x or y, and majority rule determines the outcome. Solving this game via backward induction, given bribe schedules (a,b), voter i will prefer to vote for x if $a_i+v_i>b_i$ and for y if $a_i+v_i< b_i$; we assume that an indifferent i votes for y. Given bribe schedule a and a constraint W_B , B seeks the least-cost majority to bribe. Since indifferent voters choose y, B need pay no more than a_i+v_i to secure the vote of i, and if this amount is nonpositive, she gets i's vote with no bribe at all. Thus, B solves

$$\min_{C} \left\{ \sum_{i \in C} \max\{0, a_i + v_i\} : \left| C \right| > n/2 \right\}$$

as long as this amount is strictly less than W_B ; otherwise, she chooses $b=(0,\ldots,0)$, that is, B bribes no one. Finally, A sets his bribe schedule so as to have x prevail in the least-cost manner (if affordable), taking into consideration B's predicted reaction.

As do Groseclose and Snyder (1996), I restrict attention to situations in which W_A is large enough relative to W_B and \mathbf{v} so that, in equilibrium, x prevails over y. For the latter to occur, the schedule selected by A must be such that for every majority coalition C, $\sum_{i \in C} \max\{0, a_i + v_i\} \ge W_B$; I refer to bribe schedules satisfying these inequalities as unbeatable. Let $U(\mathbf{v}, W_B) \subseteq \mathfrak{M}_B^+$ denote the set of unbeatable bribe sched-

Jeffrey S. Banks is Professor of Political Science, Division of Humanities and Social Sciences, California Institute of Technology, Pasadena, CA 91125 (bnks@hss.caltech.edu).

This article (previously titled "Buying Minimal Majorities") has benefited greatly from the comments of Tim Groseclose and three anonymous referees, as well as the financial support of the National Science Foundation under grant SES-9975141.

ules, and for any schedule a let $S(a) = \sum_{i=1}^{n} a_i$ be the expenditure associated with a. The above assumption on W_A , W_B , and \mathbf{v} is that there exists an unbeatable bribe schedule affordable for A; that is, $\tilde{a} \in U(\mathbf{v}, W_B)$ such that $S(\tilde{a}) \leq W_A$. A then solves

$$\min\{S(a): a \in U(\mathbf{v}, W_B)\}. \tag{1}$$

The set $U(\mathbf{v}, W_B)$ is evidently closec, whereas the set $\{a \in \Re_+^n : S(a) \leq S(\tilde{a})\}$ is compact. Their intersection, within which any solution to expression 1 must reside, is compact (and nonempty by \tilde{a}); and since S is continuous, a solution to expression 1 exists.

Characterizing a solution to expression 1 is made easier by the following observation. For any $a \in \mathfrak{R}_{+}^{n}$, let $C(a) = \{i \in N : a_i > 0\}$ denote the set of individuals who receive a bribe from A. Then one can show that there exists a solution a' to expression 1 in which $a'_i + v_i = a'_j + v_j$ for all $i, j \in C(a')$; that is, under schedule a' all voters bribed by A are equally expensive for B to bribe. The intuition is that A has no incentive to bribe voters, which make them differentially expensive for B to bribe, as B will simply ignore the higher cost voters in constructing a least-cost majority. Groseclose and Snyder (1996) refer to this as a leveling schedule; let $U'(\mathbf{v}, W_B) \subseteq U(\mathbf{v}, W_B)$ denote the set of unbeatable leveling schedules, that is, bribe schedules $a \in U(\mathbf{v}, W_B)$, such that $a_i + v_i = a_j + v_j = t(a)$ for all $i, j \in C(a)$. The bribe $a_i = t(a) - v_i$ made to $i \in C(a)$ can be thought of as the sum of two terms. The first (t(a)) is a positive "transfer" common among all members of C(a), and the second $(-v_i)$ can be positive or negative and is individual-specific. The latter term brings all the members of C(a) to being indifferent between x and y, absent any bribe from B; the former term represents the per-capita amount necessary to make C(a), together with any unbribed voters, unaffordable to B.

To simplify the analysis further, I make the following pair of assumptions:

A1:
$$\nu_{(n+1)/2} < 0$$
;

A2:
$$v_1 < 2W_B/(n+1)$$
.

One implication of A1 is that in the absence of any bribes y will defeat x, so in equilibrium A must bribe at least one voter. In fact, A2 implies that A must bribe at least a majority of voters; otherwise, B will have sufficient resources to bribe a majority of voters, and y will defeat x. A2 also implies that for all $a \in U'(\mathbf{v}, W_B)$ it must be that $t(a) \ge 2W_B/(n+1)$; otherwise, B can bribe a majority from the coalition C(a) itself and have y defeat x. More substantively, A2 says that B cares a great deal more about defeating x than any of the voters care about x prevailing. Propositions 2, 3, and 4 of Groseclose and Snyder (1996) assume A1 holds; A2 is new.

For any $a \in \mathfrak{R}_{+}^{n}$ let k(a) = |C(a)|, and suppose $a \in U^{l}(\mathbf{v}, W_{B})$ is such that $v_{i} \geq v_{j}$ and $j \in C(a)$ but $i \notin C(a)$; that is, i is at least as favorable to x as is j, but j is bribed and i is not. Then, under A2, there exists $a' \in U^{l}(\mathbf{v}, W_{B})$ with $S(a') \leq S(a)$, k(a') = k(a), and $i \in U^{l}(\mathbf{v}, W_{B})$

C(a'), but $j \notin C(a')$ by simply swapping the roles of i and j: $a'_i = t(a) - v_i$, $a'_j = 0$, and for all $m \notin \{i, j\}$, $a'_m = a_m$. Repeating this logic, and recalling that $v_1 \ge \cdots \ge v_n$, we see that for all $a \in U^l(v, W_B)$ there exists $a' \in U^l(v, W_B)$ such that $S(a') \le S(a)$ and $C(a') = \{1, \ldots, k(a)\}$, so we can without loss of generality restrict attention to schedules a by A, which bribe the first k(a) voters. Call these monotonic schedules, and let $U_m^l(v, W_B) \subseteq U(v, W_B)$ denote the set of unbeatable schedules that are both monotonic and leveling.

Therefore, when A2 holds,

$$\min\{S(a): a \in U(\mathbf{v}, W_R)\}\$$

$$= \min\{S(a) : a \in U_m^l(\mathbf{v}, W_B)\}.$$

Because the constraint set in the latter is more manageable than the constraint set in the former, I will focus on solving the latter optimization problem.

For any $a \in U_m^l(\mathbf{v}, W_B)$, the expenditure S(a) can be written

$$S(a) = \sum_{i \in C(a)} a_i = \sum_{i \in C(a)} [t(a) - v_i] = k(a) \cdot t(a)$$
$$- \sum_{i \le k(a)} v_i.$$

Furthermore, the parameters k(a) and t(a) completely characterize any schedule $a \in U_m^l(\mathbf{v}, W_B)$, so A's optimization problem can be reformulated as the choice of parameters k and t. That is, A now solves

$$\min_{k,t} k \cdot t - \sum_{i \leq k} v_i$$

subject to the constraint that the induced schedule, call it $a(k, t, \mathbf{v})$, lies in $U_m^l(\mathbf{v}, W_B)$. This induced schedule is defined as $a_i = t - v_i$ if $i \le k$; $a_i = 0$ otherwise. Using A1 and A2, I can reformulate this as an unconstrained problem involving simply the choice of k, as follows. If $a(k, t, \mathbf{v})$ is unbeatable, then by A2 we know that $k \ge (n+1)/2$, so by A1 it must be that if $a_i(k, t, \mathbf{v}) = 0$, then $v_i < 0$; that is, all nonbribed voters prefer (in the absence of bribes) y to x. Therefore, B receives the votes of all $i \in \{k+1, \ldots, n\}$ for "free." For $a(k, t, \mathbf{v})$ to be unbeatable it must then be that B cannot afford to bribe the additional (n+1)/2 - (n-k) = k - (n-1)/2 voters needed to form a majority, or

$$t \cdot [k - (n-1)/2] \ge W_R.$$

Solving this for equality gives the optimal transfer from A to members of $C(a) = \{1, \ldots, k\}$, conditional on k:

$$t(k, W_B) = \frac{W_B}{k - (n - 1)/2}$$
 (2)

Defining

$$E(k, \mathbf{v}, W_B) = k \cdot t(k, W_B) - \sum_{i \le k} v_i$$
 (3)

¹ A2 guarantees that a' is nonnegative.

as the minimal "winning" expenditure conditional on k, A's problem now is to

$$\min_{k} \{ E(k, \mathbf{v}, W_B) : k \in \{ (n+1)/2, \dots, n \} \}.$$
 (4)

I assume that if there are multiple solutions to this problem, A selects the smallest solution. Modulo this adjustment, let $k^*(\mathbf{v}, W_B)$ denote the solution to expression 4. This solution implicitly generates a solution to expression 1 through expression 2 and the induced bribe schedule described above.

Finally, recall that, by A2, $k^*(\mathbf{v}, W_B)$ must be at least (n+1)/2, so that by A1 the only individuals who vote for x, A's preferred alternative, are those who are bribed by A; Groseclose and Snyder (1996) refer to this as a flooded coalition.² The number of individuals voting for x is equal to $k^*(\mathbf{v}, W_B)$, the number bribed by A, and so results on $k^*(\mathbf{v}, W_B)$ are equivalently results on the size of the coalition voting for A's preferred alternative. In particular, a supermajority votes for A's preferred alternative if and only if a supermajority is bribed by A. Also, note that $k^*(\mathbf{v}, W_B)$ identifies not only the size of A's optimal coalition but also a voter, namely, the voter who receives the largest bribe from A.

RESULTS

I begin with a characterization of $k^*(\mathbf{v}, W_B)$; for notational ease, in some of what follows I will suppress the dependence of E and k^* on \mathbf{v} and W_B . Because the number of possible values for k is finite, I cannot employ calculus techniques to identify k^* , but a discrete version of these techniques can be used. For all $k \in \{(n+1)/2, \ldots, n-1\}$, define $\Delta(k) = E(k+1) - E(k)$; that is, $\Delta(k)$ is the difference in expenditures from adding the $(k+1)^{\text{st}}$ voter to the coalition $\{1, \ldots, k\}$. If $\Delta(k) < 0$, then (since A is attempting to minimize expenditures) A has an incentive to add the $(k+1)^{\text{st}}$ voter to the coalition. Conversely, if $\Delta(k) \geq 0$, then A does not want to add the $(k+1)^{\text{st}}$ voter (recall our tie-breaking rule in favor of smaller coalitions). This gives a sense of the local or "first-order" effects of changing the coalition size.

Next, suppose $\Delta(k)$ is increasing in k, which is simply the discrete version of the second-order condition that E(k) be convex in k. The following algorithm then can be used to identify k^* : If $\Delta((n+1)/2) \geq 0$, then we know from $\Delta(k)$ increasing that $\Delta(k) > 0$ for all larger values of k, and hence the optimal value of k is $k^* = (n+1)/2$. If $\Delta((n+1)/2) < 0$, then we know that k^* must be greater than (n+1)/2, so we next solve for $\Delta((n+3)/2)$. If this term is nonnegative, then, again by $\Delta(k)$ increasing, we have that $k^* = (n+3)/2$; if the term is negative, then we next check (n+5)/2; and so on. When $\Delta(k)$ is increasing, we have the following implicit characterization of the optimal coalition size:

$$k^* = \begin{cases} (n+1)/2 & \text{if } \Delta((n+1)/2) \ge 0\\ \max\{k : \Delta(k-1) < 0\} & \text{otherwise} \end{cases}$$
 (5)

Finally, I show that $\Delta(k)$ is indeed increasing in k. From equations 2 and 3,

$$\Delta(k) = \left[\frac{(k+1)W_B}{k+1 - (n-1)/2} - \sum_{t \le k+1} v_t \right]$$

$$- \left[\frac{kW_B}{k - (n-1)/2} - \sum_{t \le k} v_t \right]$$

$$= W_B \left[\frac{(k+1)}{k+1 - (n-1)/2} - \frac{k}{k - (n-1)/2} \right] - v_{k+1}$$

$$= \frac{-W_B(n-1)}{2(k+1 - (n-1)/2)(k - (n-1)/2)} - v_{k+1}$$

$$= T(k, W_B) - v_{k+1}.$$
 (6)

Treating k for the moment as a continuous variable, it is easily seen by differentiation that $T(k, W_B)$ is increasing in k. Furthermore, since $v_1 \ge v_2 \ge \cdots \ge v_n$, the second term, $-v_{k+1}$, is nondecreasing in k. Hence, the discrete second-order condition holds, which implies the above local analysis is also global: Equation 5 defines the optimal coalition size.

Although generating an explicit characterization of k^* via equations 5 and 6 admittedly would be somewhat messy, the parameter values that give rise to the "corner" solutions, that is, k^* equal to either (n+1)/2 or n, are straightforward to identify. We have that $k^* = (n+1)/2$ if and only if $\Delta((n+1)/2) \geq 0$, and $k^* = n$ if and only if $\Delta(n-1) < 0$; inserting the relevant values into $T(k, W_B)$, we obtain the following.

Proposition 1. (a) $k^*(v, W_B) = (n + 1)/2$ if and only if $v_{(n+3)/2} \le -W_B(n - 1)/4$; (b) $k^*(v, W_B) = n$ if and only if $v_n > -2W_B/(n + 1)$.

Therefore, to determine whether a minimal majority coalition is optimal, the only relevant part of the preference profile \mathbf{v} is the $((n+3)/2)^{st}$ term, and the only relevant part for a universalistic coalition is the last term. Of course, if neither inequality in proposition 1 holds, $k^*(\mathbf{v}, W_B)$ lies strictly between (n+1)/2 and n; that is, the optimal coalition is a less-than-universalistic supermajority. Note also that proposition 1(b) identifies a lower-bound constraint on \mathbf{v} symmetric to the upper-bound constraint imposed above. Whereas A2 requires no voter to prefer x over y by more than $2W_B/(n+1)$, proposition 1(b) says that if, in addition, no voter prefers y over x by more than $2W_B/(n+1)$, then the optimal choice by A is to bribe all the voters.

Proposition 1(a) gives as an immediate consequence separate necessary and sufficient conditions for a min-

² The implication of adding A2 to what Groseclose and Snyder (1996) already assume is that nonflooded coalitions, which are at times optimal in their environment, are never optimal here.

imal majority to be optimal, based only on the preference intensities of the "extreme" voters:

COROLLARY 1.
$$k^*(v, W_B) = (n + 1)/2$$
 if $v_1 \le -W_B(n - 1)/4$, and only if $v_n \le -W_B(n - 1)/4$.

In words, a sufficient condition for A to find it optimal to bribe a minimal majority of voters is that all voters find y significantly more attractive than x, whereas a necessary condition is that at least one voter finds this to be so.³

Like proposition 1(b), proposition 3.3 in Groseclose and Snyder (1996) provides a necessary and sufficient condition for a universalistic coalition to be optimal in the continuum model, but only under a linear restriction on preference intensities (see below). Such an assumption is also made for their proposition 4 as to when minimal majorities are optimal; yet, since the concept of a minimal majority is not well defined with a continuum of voters, their result assumes a finite legislature and so is directly comparable to results here. Suppose voter preference intensities can be written

$$v_i = \alpha - \beta [i - (n+1)/2],$$

with $\alpha \le 0$ and $\beta \ge 0$. Proposition 4 in Groseclose and Snyder (1996) asserts that if $k^*(\mathbf{v}, W_B) = (n + 1)/2$, then it must be that $W_B < (2.1)\beta$. That is, as long as B is willing to spend more than twice the difference in preference intensity between "adjacent" voters, A must bribe a supermajority. But consider this example: n =7, $W_B = 3$, and $v_i = -5$ for all $i \in N$, which implies $\alpha = -5$ and $\beta = 0$ in the above linear format. According to Groseclose and Snyder, $k^*(v, W_B)$ should be strictly greater than four, but this is not true. Because $v_i < 0$ for all $i \in N$, B gets all voters not bribed by A for free. If A bribes four voters, she must pay each 3 + 5 = 8 (so that B cannot afford to attract any one voter), giving a total payment of 32. If A bribes five voters, the required bribe is 1.5 + 5 = 6.5 (so that B cannot attract any two), for a total payment of 32.5; similarly, the bribes to six and seven voters total 36 and 40.25, respectively. Therefore, A's optimal strategy is to bribe precisely a minimal majority of four voters, which contradicts proposition 4 of Groseclose and Snyder. Furthermore, we know from proposition 1(a) that this example is robust to (small) changes in the values of α and β ; all that is needed is v_1 less than .75 (so A2 holds) and $v_{(n+3)/2}$ less than -4.5 for the optimal coalition size to be a minimal majority.

I next identify how the optimal coalition size varies with voter preference intensity. Given an arbitrary amount W_B and preference profile \mathbf{v}' , let $k' = k^*(\mathbf{v}', W_B)$. If k' = (n+1)/2, then we know that $k^*(\mathbf{v}, W_B) \geq k'$ for all \mathbf{v} , so suppose k' > (n+1)/2. From equation 5 we infer $\Delta(k'-1, \mathbf{v}', W_B) < 0$, which from equations 6 and 7 is equivalent to $v'_{k'} > T(k'-1, W_B)$. Now suppose the preference intensities change from \mathbf{v}' to \mathbf{v} , and $v_{k'}$ is such that $v_{k'} \geq v'_{k'}$. Then, $v_{k'} > T(k'-1, W_B)$, and hence $\Delta(k'-1, \mathbf{v}, W_B) < 0$. But

from equation 5 it must be that $k^*(\mathbf{v}, W_B) \ge k'$. Therefore, I have proven the following.

PROPOSITION 2. For all W_B , if v and v' are such that $v_{k'} \ge v'_{k'}$, where $k' = k^*(v', W_B)$, then $k^*(v, W_B) \ge k^*(v', W_B)$.

In words, if the preference intensity of the "marginal" bribed voter weakly increases, then the optimal coalition size will weakly increase as well, regardless of any changes in the other voters' intensities. An equivalent statement in terms of bribes is this: The number of voters bribed by A weakly increases as the voter who receives the largest bribe finds A's preferred alternative, x, more attractive.

The above argument can be turned around to generate a sufficient condition for the optimal coalition size to decrease weakly. As before, let $k' = k^*(\mathbf{v}', W_B)$; if k' = n, then clearly $k^*(\mathbf{v}, W_B) \leq k'$ for all \mathbf{v} , so let k' < n. By equation 5 I induction $(k', \mathbf{v}', W_B) \geq 0$, or from equations 6 and $(k', \mathbf{v}', W_B) \geq 0$. Suppose $(k', \mathbf{v}', W_B) \leq 0$, which implies by equation 6 that $(k', \mathbf{v}, W_B) \geq 0$, and hence by equation 5 that $(k', \mathbf{v}, W_B) \leq 0$, and hence by equation 5 that $(k', \mathbf{v}, W_B) \leq 0$, and hence by equation 5 that $(k', \mathbf{v}, W_B) \leq 0$. Therefore, we have the following.

Proposition 3. For all W_B , if \mathbf{v} and \mathbf{v}' are such that $\mathbf{v}_{\mathbf{k}'+1} \leq \mathbf{v}'_{\mathbf{k}'+1}$, where $\mathbf{k}' = \mathbf{k}^*(\mathbf{v}', W_B)$, then $\mathbf{k}^*(\mathbf{v}, W_B) \leq \mathbf{k}^*(\mathbf{v}', W_B)$.

In words, if the preference intensity of the marginal nonbribed voter weakly decreases, then the optimal coalition size will weakly decrease as well, regardless of any changes in other voters' intensities. (Unlike proposition 2, however, this voter cannot be identified from the bribes offered by A.) Combining propositions 2 and 3, we see that if the preference intensities of the marginal bribed and nonbribed voters do not change, then the optimal coalition size also does not change.

The logic of propositions 2 and 3 stems from the "convexity" of E and the subsequent ability to adopt a first-order approach in characterizing the optimal coalition size. As with the traditional calculus technique, in the presence of such convexity, only "local" information is relevant for generating comparative statics about how changes in \mathbf{v} affect changes in E. Here, this local information is summarized by the preference intensities of the marginal bribed and nonbribed voters.

Of course, in order to identify these voters (and so verify the conditions in either proposition) one needs to solve for the optimal coalition size, which as mentioned above might prove somewhat messy. Yet, both propositions give rise to a weaker, more global comparative statics result that does not require such a computation. Given two preference profiles \mathbf{v} and \mathbf{v}' , write $\mathbf{v} \geq \mathbf{v}'$ if $\mathbf{v}_i \geq \mathbf{v}_i'$ for all $i \in N$.

COROLLARY 2. For all W_B , if $v \ge v'$ then $k^*(v, W_B) \ge k^*(v', W_B)$.

Thus, the number of voters bribed by A, and hence the size of A's optimal coalition, weakly increases as voters

³ I thank an anonymous referee for suggesting that corollary 1 (which was in a previous draft) could be generalized to proposition 1(a) (which was not).

find A's preferred alternative, x, more attractive. This result certainly has a counterintuitive feel, as one might expect just the opposite, namely, that as x becomes more attractive relative to y, fewer voters will need to be bribed. The latter may well be true in a one-party model, but in this case A's optimal behavior is driven by the predicted competitive response of B. Thus, although A's total expenditure will surely decrease as x becomes more attractive, the optimal way to allocate this lower amount is to spread it more widely among the voters.

The logic of corollary 2, independent of its status as an implication of propositions 2 and 3, comes directly from the ability to restrict attention to leveling, monotonic bribe schedules. From the former (leveling) we can write A's expenditure, conditional on bribing k voters, as an additively separable function of the transfer necessary to fight off B and of voter preference intensities. Although this expenditure obviously depends on the transfer, the *change* in the expenditure due to a change in voter preferences does not. And from the latter (monotonic) we know that as x becomes more attractive to the voters, the change in expenditure will be greater, the larger is k. That is, from equation 3,

$$E(k, \mathbf{v}', W_B) - E(k, \mathbf{v}, W_B) = k \cdot t(k, W_B) - \sum_{i \leq k} v_i'$$

$$-\left[k\cdot t(k, W_B) - \sum_{i \leq k} v_i\right] = \sum_{i \leq k} (v_i - v_i).$$

This sum weakly increases in k when $\mathbf{v} \geq \mathbf{v}'$, since each of the terms in the sum is nonnegative. Let k' be optimal at \mathbf{v}' and k < k', which implies that k is necessarily suboptimal. Then, in moving from \mathbf{v}' to \mathbf{v} , the expenditure on k' decreases by a greater amount than does the expenditure on k, so k remains suboptimal. This does not imply that k' is optimal at \mathbf{v} , merely that if it is not optimal, then the new optimal size must be greater than k'.

Two additional features of corollary 2 are worthy of comment. First, Groseclose and Snyder (1996) identify a similar comparative statics result in their continuum model; voters are indexed by a uniform distribution on [-1/2, 1/2], and preference intensities are described by a nonincreasing and differentiable function $v : [-1/2, 1/2] \rightarrow \Re$. As in their proposition 4, however, they require v to be linear: $v(z) = \alpha - \beta z$, with $\beta \ge 0$ and $\alpha \le 0$. They then show that k^* is nondecreasing in α , which is analogous to my corollary 2.5 Second, the result as stated requires each voter's preference for x over y, as measured by v_i , to increase weakly. Yet, as mentioned above, voters are indistinguishable to A and B beyond these v_i s. Even if some voters have v_i

decrease, as long as the new distribution of preference intensities is everywhere above that of the old, corollary 2 will remain true. That is, as long as the highest value in \mathbf{v} is greater than or equal to the highest value in \mathbf{v}' , the second-highest value in \mathbf{v} is greater than or equal to the second-highest value in \mathbf{v}' , and so on, it will be the case that $k^*(\mathbf{v}, W_B)$ will be greater than or equal to $k^*(\mathbf{v}', W_B)$.

Finally, I show that A's optimal coalition size k^* is monotonic in W_B as well. Because A2 depends on W_B , I need to add the assumption that $v_i \leq 0$ for all i.

Proposition 4. For all \mathbf{v} , if $\mathbf{W}_{\mathrm{B}} > \mathbf{W}_{\mathrm{B}}'$, then $\mathbf{k}^*(\mathbf{v}, \mathbf{W}_{\mathrm{B}}) \geq \mathbf{k}^*(\mathbf{v}, \mathbf{W}_{\mathrm{B}}')$.

Therefore, as B's willingness to pay increases, A tends to bribe a greater number of voters. The proof is similar to that for proposition 2. Let $k' = k^*(\mathbf{v}, W_B')$. From equation 5 we know that $\Delta(k'-1, \mathbf{v}, W_B') < 0$, so from equations 6 and 7, $v_{k'} > T(k'-1, W_B')$. Since T is clearly decreasing in its second argument, $W_B > W_B'$ implies $v_{k'} > T(k'-1, W_B)$, and $\Delta(k'-1, \mathbf{v}, W_B') < 0$, which by equation 5 implies $k^*(\mathbf{v}, W_B) \ge k'$.

DISCUSSION

The propositions and corollaries presented here give a fairly complete theoretical picture of supermajority bribery under certain assumptions, in particular, the preference restrictions embodied in A1 and A2. These assumptions allow us to focus, without loss of generality, on a relatively simple class of bribe schedules (monotonic and leveling) and translate A's optimization problem into one with an attractive mathematical property (convexity). An open question is the extent to which my results survive the weakening of these assumptions. For instance, without A2 there can exist voters who prefer x to y by such a great amount that A finds it optimal not to bribe them at all (see Figure 4 in Groseclose and Snyder 1996), thereby adopting a nonmonotonic, although still leveling, schedule. A would essentially be working on two margins in moving through $\{1, \ldots, n\}$, namely, when to start bribing and when to stop, in contrast to the one-margin analysis (when to stop) associated with monotonic schedules. This suggests that the corresponding analysis of A's optimal behavior will be considerably more intricate than that found here.

⁴ The only requirement is that $\nu_i \ge \nu_i'$ for all $i \in \{(n+3)/2, \ldots, n\}$, as the first (n+1)/2 voters receive bribes regardless of preference intensities.

³ Groseclose and Snyder (1996) also show that k^* is decreasing in β . Yet, although they state that "as β ruses, the initial level of support in the legislature for x declines" (p. 310), which suggests a similar effect to that from α , this statement only holds for $x \in (0, 1/2]$; for $x \in [-1/2, 0)$, a rise in β leads to an increase in support for x.

⁶ Groseclose and Snyder (1996) obtain a similar result in their continuum model, without the linear restriction on preferences.

Vote Buying, Supermajorities, and Flooded Coalitions

TIM GROSECLOSE Stanford University
JAMES M. SNYDER, Jr. Massachusetts Institute of Technology

In a recent paper, Banks (2000), adopting the framework of our model (Groseclose and Snyder 1996), derives several new and noteworthy results. In addition, he provides a counterexample to our proposition 4. Here we explain the error in our proposition but note that we can correct it easily if we invoke an additional assumption: In equilibrium the winning vote buyer constructs a nonflooded coalition, that is, she does not bribe every member of her coalition. We conclude with a brief discussion of the substantive implications of Banks's proposition 1; we note that it provides additional support for our general claim that minimal winning coalitions should be rare in a vote-buying game.

HOW PROPOSITION 4 CAN BE RESTATED CORRECTLY

ur mistake in proposition 4 was to assume that the solution to a step in the proof occurred at an interior point when, in fact, the solution might occur at a boundary point.

In our proof we define m as the surplus of A's coalition. That is, the size of A's coalition is m + (n + 1)/2, although only A needs (n + 1)/2 legislators (a bare majority) to pass the bill. Vote buyer B is willing to pay W_B to defeat A's bill. Since he must buy m + 1 legislators to invade A's coalition successfully, A can prevent B from invading if each of her legislators costs at least $W_B/(m + 1)$ for B to buy. We show that A will adopt a leveling strategy. That is, each member of her paid coalition will cost exactly $W_B/(m + 1)$ for B to buy.

Legislators are labeled $i=1, 2, \ldots, n$, and we assume that the legislators have linear preferences. That is, the utility that i receives for voting for A's bill is $v(i) = \alpha - \beta[i - (n+1)/2]$. Define i_0 as the left-most legislator whose initial preferences are less than $W_B/(m+1)$. This legislator will be the left-most member of A's bribed coalition. Let s be the (hypothetical, possibly noninteger-valued) legislator whose preferences for A's bill equals $W_B/(m+1)$. That is, $W_B/(m+1) = v(s) = \alpha - \beta[s - (n+1)/2]$, or $s = [\alpha - W_B/(m+1)]/\beta + (n+1)/2$. Define $\delta(m)$ as the distance between i_0 and s.

If A has not bribed all the members of her coalition, we call this a nonflooded coalition. In this case there exists a legislator to the left of i_0 , labeled $i_0 - 1$. Furthermore, s must lie between these two legislators. Therefore, $\delta(m) \in [0, 1]$.

If A has constructed a flooded coalition, however, that is, she has bribed all members of her coalition, then there is no legislator to the left of i_0 , and it is possible for $\delta(m)$ to be greater than one.

Our mistake is on line 20 of the proof: "Since $\delta(m) \in [0, 1], \ldots$ " Of course, this is not necessarily true when A has constructed a flooded coalition. If we

assume, however, that A constructs a nonflooded coalition, then the proof follows. Thus, the following is a corrected restatement of proposition 4: Suppose $v(i) = \alpha - \beta[i - (n+1)/2]$, with $\beta \ge 0$ and $\alpha \le 0$. If $a^*()$ and $b^*()$ constitute an equilibrium in which A constructs a nonflooded coalition and x wins, then $m^* = 0$ only if $W_B \le [1/3 + (28/9)^{1/2}]\beta < (2.1)\beta$. (The original version does not contain the phrase in italics, but it is otherwise identical.)

While the nonflooded coalition assumption is crucial for our result, the opposite assumption is crucial for Banks's results. As he shows, his A2 assumption implies that the winning vote buyer bribes each member of her coalition in equilibrium, that is, she constructs a flooded coalition.

Substantively, this condition is fairly restrictive. It requires that all members of a coalition, even the most ardent supporters, receive bribes in equilibrium. In contexts in which legislators themselves are the vote buyers, this is impossible. For a genuine flooded coalition to occur, the legislators must receive side payments, not pay them. An example of legislators who are vote buyers is Groseclose's (1996) case study of the Byrd Amendment to the Clean Air Act. Byrd was one vote buyer, and the opposing vote buyer was the team of President George Bush and Majority Leader George Mitchell.²

¹ We should also note that line two of the proof contains a typo. The minus sign in "b(i) > a(i) - v(i)" should be a plus sign.

² We should note, however, that a minor change in A2 does allow Banks's results to apply to contexts where legislators are vote buyers. For instance, suppose legislator 1 is the vote buyer, and she has such intense preferences for x that A2 is violated. As long as the other legislators' preferences satisfy A2, Banks's results do not change qualitatively. Nevertheless, if one restricts the size of the legislature so that it is not too small, and if one restricts preferences of the vote-buying legislators so that they do not differ too drastically from the preferences of the other legislators, then the results do change qualitatively. For instance, suppose (i) preferences take a linear form (as in our proposition 4); (ii) $n \ge 5$; (iii) legislator 1 is vote buyer A (thus, $v_1 = W_A$); and (iv) the preferences of the other legislators satisfy A2. Then there does not exist an equilibrium in which legislator 1 buys votes (Basically, A2 places a minimum bound on W_B , which makes it too expensive for 1 to buy votes successfully. A proof is available from the authors.) That is, if conditions i-iv are satisfied, then Banks's proposition 1 does not hold in the context where legislators are vote buyers, even with the change in A2.

Tim Groseclose is Associate Professor of Political Economy, Graduate School of Business, Stanford University, Stanford, CA 94305-5015. James M. Snyder, Jr., is Professor of Political Science and Economics, Massachusetts Institute of Technology, Cambridge, MA 02139-4307.

SUBSTANTIVE IMPLICATIONS OF BANKS'S PROPOSITION 1

We conclude with two brief thoughts on Banks's proposition 1. First, it is a very interesting and impressive result. It provides a necessary and sufficient condition for a minimal winning coalition to occur (unlike our proposition 4, which only provides a necessary condition). Furthermore, unlike our proposition 4, the result does not need to assume that preferences are linear. It does require, however, that preferences satisfy assumption A2,

Second, the proposition shows that our original conclusion—that minimal winning coalitions should be rare—is even more general than our original statement.³ The condition in the proposition requires that $\nu_{(n+3)/2} \leq -W_B(n-1)/4$. That is, for a minimal winning coalition to occur, the legislator just to the

right of the median voter must strongly favor the right-wing vote buyer's alternative, relative to the size of the legislature (n) and the right-wing vote buyer's intensity of preference (W_B) . When the size of the legislature is at least five members, the condition requires that the legislator favor the alternative more strongly than the right-wing vote buyer (even though the legislator is fairly "centrist"). In our view, this should occur very rarely in practice; thus it supports our claim that minimal winning coalitions should be rare.

Analytic Narratives by Bates, Greif, Levi, Rosenthal, and Weingast: A Review and Response

Analytic Narratives. By Robert H. Bates, Avner Greif, Margaret Levi, Jean-Laurent Rosenthal, and Barry Weingast. Princeton, NJ: Princeton University Press, 1998. 296p. \$65.00 cloth, \$22.95 paper.

he rational choice revolution in political science began in American politics in the 1970s, first influenced international relations in the 1980s, and made its way to comparative politics during the 1990s. As it moved beyond its base in American politics, rational choice theory confronted comparative and historical questions of regime transition, social conflict, democratic stability, economic development, and international governance. The application of rational choice theory to these macro concerns creates analytic problems that were less relevant when the

approach was applied primarily to microquestions. Robert Bates, Avner Greif, Margaret Levi, Jean-Laurent Rosenthal, and Barry Weingast have written a much discussed book, Analytic Narratives, that develops these novel applications. Jon Elster, a seminal rational choice theorist who also has written extensively on comparative and historical problems, believes that Analytical Narratives expresses hopes for rational choice theories of comparative and historical processes that exceed what the approach is capable of producing. Bates and his colleagues reject Elster's critique and defend their goal of a genuine social science capable of addressing large-scale phenomena. Is rational choice history a case of excessive ambition, or is it the logical next step in the rational choice revolution in political science?

Rational Choice History: A Case of Excessive Ambition

JON ELSTER Columbia University

n Pathologies of Rational Choice, Donald Green and Ian Shapiro (1994) claim that rational choice theory has poor empirical support. Analytic Narratives (AN) is among other things an attempt to rebut this claim (p. 231).1 In my opinion, Bates et al. do not succeed in their attempts to explain complex historical phenomena in terms of rational choice. Although my comments may seem harsh, certain statements in the Introduction and the Conclusion invite the application of strict criteria. The authors claim that "the chapters in this volume ... engage the concerns of many disciplines and should therefore command a broad audience" (p. 3). Similarly, "because the chapters engage such fundamental issues, they are of general significance" (p. 230); moreover, "they furnish deep insights in particular cases" (p. 232).

I proceed in three steps. First, I discuss each chapter to argue that the authors make serious errors of commission that undermine the credibility of the analyses. Second, I raise some general questions concerning the application of rational choice models to large-scale historical phenomena. I argue that the

contributors to AN make important errors of omission, such as failure to provide microfoundations or to offer evidence about the beliefs and intentions of the actors. Third, I try to draw some conclusions about the feasibility of the AN project.

INDIVIDUAL CHAPTERS

Greif's Chapter

The study by Avner Greif of the political economy of late-medieval Genoa offers a periodization of Genoese politics between 1099 and (roughly) 1350. From 1099 to 1154, an economically suboptimal but peaceful equilibrium obtained. Each clan invested in military strength to deter the other from becoming a controlling clan, with the result that fewer resources were available for economic cooperation abroad. (Following Greif, I assume throughout that there were two clans only.) They might still cooperate in economic ventures, but at a less than optimal level. Between 1154 and 1164, an external threat did away with the need for investing in military strength, which made more resources available for economic cooperation. From 1164 to 1194, there was semipermanent interclan warfare. After 1194, the presence of an external administrator of the city, the podestà, brought about peace and "spectacular economic performance" (p. 58). I focus on the second period (1154-64) and the final period (after 1194). As the chapter is opaquely written and marred by severe misprints (e.g., in the statement of Condition III on p. 51), I had to work hard to figure out what is being said. If I got it wrong, Greif must share the blame.

Greif's argument about the optimal nature of the

¹ Unless otherwise stated, all page references are to this volume. In assessing the chapters by Bates and Levi, I also draw on some of their other writings. Although Greif refers to a forthcoming book-length version of his chapter in AN and Weingast to an unpublished book-length manuscript, I did not have access to these. Some of the issues I raise in the text may be addressed by these more extensive discussions.

second period is based on the premise that the external power will attack if and only if there is interclan warfare. Consider first the "if" part of the premise. Because the clans know that if they fight each other the future will look bleak, they need not invest in military strength to deter each other. Without an external threat, they may have to invest to raise the cost to the other of attacking. With an external threat, the benefits of attack are so small that no deterrence is needed. Consider next the "only if" part of the premise. If there is no need to fear an external attack as long as they abstain from fighting each other, the clans can devote all their resources to economic cooperation. This seems implausible. A strong external power might attack, with some positive probability, even if the clans manage to keep peace. Greif acknowledges as much on page 32. To deter attack and/or to increase their chances of winning a war against the external enemy, the clans would presumably invest some resources in military strength. Greif acknowledges as much: "Rival clans within various Italian city-states often cooperated in confronting external threats" (p. 42). This military cooperation must have come at the expense of economic cooperation. Greif seems to ignore, as far as I can see, that both investment to deter or fight an external enemy and investment to deter a rival clan must come at the expenses of resources available for economic cooperation. Although the presence of the external enemy does away with the need to invest for the latter purpose, it creates a need to invest for the former. In the absence of more information, the net effect of an external enemy on military investment is indeterminate.

I also was not persuaded by Greif's claim that the podestà restored peace and efficiency in the final period. Consider first the argument that the presence of a third party—the external podestà—prevented the endemic interclan warfare that characterized the third period. Greif captures the strategic interaction between the two clans and the podestà by means of two games. In the analysis of the "collusion" game between one clan and the podestà against the other clan, he asserts that "after collusion has occurred, the amount by which the clan would reward a podestà would depend on the podestà's ability to confront that clan militarily" (p. 49), because if he could not gain by confronting it, then the clan could not credibly promise to reward him.

The collusion game is embedded in a larger "podesteria game," in which the first clan has the choice between challenging and not challenging the second; the second, if challenged, has a choice between fighting and not fighting; and the podestà, if the second clan is challenged, has three choices—collude with the first clan, prevent the first clan from taking control (this means the podestà tries to take control for himself), and do nothing. For specific parameter values this game has a subgame-perfect equilibrium in which clan 1 does not challenge; clan 2 fights if challenged; and the podestà prevents if clan 1 challenges and clan 2 fights, and, if clan 2 does not fight, either colludes or does nothing. The podestà has to be strong enough to be

pivotal with a sufficiently high probability but not so strong that the first clan could credibly promise to reward him in a collusion against the second. (I simplify.)

One empirical question is whether the strength of the podestà was within the relevant interval. Greif tells us he had twenty soldiers (p. 53). This is a small number, but if the clans were of nearly equal strength, he might still be pivotal. Greif notes this fact, but fails to provide evidence about the relative strength of the clans. A more serious problem is that Greif does not explain how the podesta generated not only peace but also prosperity. In the second period, prosperity supposedly occurred because the clans could afford to disarm—they had nothing to gain by fighting each other. No mechanism is provided, however, for disarmament in the fourth period. The military strength of the clans is taken as given throughout the analysis, and Greif offers no argument that would exclude higher levels of military investment—and fewer resources available for cooperation—than in the first period. (We might also ask whether the high wage paid to the podestà cut heavily into these resources, but this is probably a minor factor.)

Rosenthal's Chapter

The second chapter is a study by Jean-Laurent Rosenthal of the political economy of European absolutism. His explanandum is nothing less than the divergent courses of French and English absolutism in the seventeenth and eighteenth centuries. To focus my comments, I limit myself to one part of that explanandum: "why per capita taxation was significantly lower in France or Spain than in England or the Low Countries" (p. 73). (Actually, I follow Rosenthal in limiting myself to the comparison between France and England.) The explanation relies on a model that links rates of taxation with gains or losses from wars financed by taxation. In brief, Rosenthal argues that tax rates were higher in countries with a unified tax system—in which either "the elite" or the king had full control over taxation—than in countries where fiscal authority was divided between them. The reason is that taxes are raised mainly for the purpose of conducting wars, the spoils from which are shared between the elite and the crown. In countries where fiscal authority is divided, neither actor can fully internalize the benefits from the taxes it raises; hence, we would expect tax rates to be lower than in a unified country.

Rosenthal assumes that "fiscal resources were used primarily to prepare for and prosecute war" (p. 69). Although he does not spell out what "primarily" means, an estimate is that "war expenditures often represented 80% of public expenditures" in early modern Europe (Bérenger 1996, 623). Whether one is justified in using 100% as a proxy for 80%, as Rosenthal does (p. 102), is not obvious to me. Rosenthal then proceeds to specify the objectives and constraints of the two actors. Both want to maximize the return from war. Both are constrained by the cost of raising resources for warfare. In a numerical exam-

ple, the cost of raising taxes is equivalent to 5% of the national product and equals the amount of taxes raised. The outcome of war affects the two actors differently, for two reasons. First, they "share the returns from winning and losing according to the extent of their fiscal control of the domestic economy" (p. 103). Second, if the war ends in a draw, which in one specification of the model happens in almost half the cases (p. 72), the elite bears all the costs of conducting war. The first mechanism is responsible for the free-rider problem mentioned above, which induces both parties to suboptimal funding of wars. The second implies that the elite might have reason to be even more reluctant than the king.

The idea of spoils divided in proportion to fiscal control is unsubstantiated, empirically and theoretically. Rosenthal does not cite any evidence that spoils were in fact divided in this way. He also does not consider alternative hypotheses, for example, that the spoils were divided in proportion to taxes raised for warfare. In one specification of the model (p. 72) the elite raises no taxes although it controls 10% of taxation and hence receives 10% of the spoils. Why would the king give away 10% of the fruits of victory to an elite that in no way contributed to it? In fact, why would the king ever give away anything? As the executive in charge of conducting the war, he was presumably in a position to retain all gains for himself. To say merely that, "after all, the king cannot hog the profits from war if he expects support from the elite" (p. 71) is to confuse ex ante and ex post decisions and to ignore the question of credible commitments. In any case, the argument fails if the elite does not raise any taxes for

The idea that the elite bears all the costs from a draw is partly defended as a substantive proposition: "The elite is . . . assumed to bear a cost from draws because it is responsible for staffing the army and the administration, both of which are made to work harder during hostilities" (p. 70). But that invites the question whether these costs would not also be incurred in case of victory or defeat. Partly (and inconsistently), however, the assumption is defended as a "convenient" (p. 70, n. 7) device to create "the key policy tension in the model: there are some wars that the king wishes to fight but that the elite does not." Rosenthal notes that there are "other ways of creating this difference," which do not, however "alter the substantive results of the analysis" (p. 70). But would it not be more appropriate to identify the reasons the king was more belligerent than the elite and model them directly?

The mathematical models in which these ideas are spelled out are described at three levels of abstraction. First, Rosenthal asserts that if one tries to work out the implications of the causal links described above, "it is possible to solve for equilibria in a general setting, but obtaining comparative static results requires additional assumptions" (p. 71, n. 9). Second, therefore, the mathematical appendix uses specific functional forms to model the relations between taxes and the cost of raising them, and between taxes raised and the probability of the war ending in victory, defeat, or draw.

Third, in the text Rosenthal draws on numerical illustrations of this model with specific parameter values, asserting that the "results stand up to specification changes" (p. 71). He makes no similar assertion, however, with respect to the choice of functional forms. Why should the reader have any confidence in the results?

Let us look more closely at one central result, concerning the partial explanandum described above. "In the model when either party controls the fiscal system, the tax rate is about 6.3 percent, whereas in the case in which the regime is evenly divided the tax rate falls below 5 percent, a drop in revenue of nearly one-fifth. This finding goes a long way toward explaining why per capita taxation was significantly lower in France...than in England" (p. 73). In a footnote Rosenthal adds: "The observed differences in rates between Great Britain and France are much larger than those found here, a finding that may well be driven by the fact that the elite was not a unified tax authority in France." I find this statement both uncomfortably ad hoc and hard to square with a later statement: "Given that the current model predicts the variation of tax rates properly, it may well be unnecessary to be concerned with elite politics" (p. 89).

In my opinion, the model does not go any way at all toward explaining the observed differences. The fit is poor (as Rosenthal admits), and the model is very artificial (as I have argued). In addition to the objections mentioned above, I cannot see any reason the same parameter values should obtain for all countries. One might expect, for instance, that the resources needed to raise a given amount of revenue (and for a given BNP) would be smaller in England than in the somewhat more sparsely populated France. Also, can one assume that all armies are equally good at converting money into probability of winning? This objection obtains both for purposes of comparative statics and for the purpose of determining the level of mobilization in the enemy.

Levi's Chapter

The third chapter, by Margaret Levi, is a study of nineteenth-century conscription in France, the United States, and, more briefly discussed, Prussia. The explanandum is "the disappearance of various ways of buying one's way out of military service if conscripted: commutation (a fee paid to government) and substitution and replacement (payment to someone else to take one's place)" (p. 109). The explanation relies on "the micromotives of four sets of key actors: government policy-makers, the army, legislators and constituents" (p. 111). As Levi notes later, a fifth actor plays a considerable role in explaining the disappearance of buying-out and its replacement by universal conscription, namely, the largely disenfranchised poor, who "rioted against commutation, making the practice sufficiently costly that government acceded to their demands" (p. 135). Although the explanation is presented as "derived from rational choice and relying on the logic of game theory" (p. 144), the chapter does not

draw on game theory at all and deviates from standard rational choice theory in one important respect.

Let me first address some empirical shortcomings of the section on France. I was surprised to read that after Thiers gave a speech in the 1848 constituent assembly advocating the maintenance of replacement, "the vote of the Assemblée Nationale was 663 against and 140 in favor of his position" (p. 129). In fact, the vote was 663 against and 140 in favor of a proposal by Deville to ban replacement. The book-length account by Levi (1997, 95) has the correct version, so the version in AN must be due to an accident of compression. Other mistakes or ambiguities, however, are common to the book and to the chapter in AN. They concern the timing of the introduction of universal (male) suffrage, the timing of the abolition of buying-out, and the causal link between the two.

Levi inconsistently dates the introduction of universal suffrage in France to 1875 (p. 111) and to 1884 (p. 130), but the dates of 1848 or $1\bar{8}71$ would be equally or more plausible. In the wake of the February revolution, the constituent assembly of 1848 was elected by universal suffrage. The constitution that it adopted also included a provision of universal suffrage. It was reintroduced in 1871, after defeat in the war against Prussia and the fall of Louis Napoleon. As for the changes in military service, Levi writes that "the military defeats of 1870 and the Commune of Paris were to sound the death of replacement" (p. 129). Hence, on her chronology, there could be no causal link between universal suffrage and universal conscription: "Since full male democracy was not achieved until 1884, direct political pressure by those who had come to believe themselves most harmed by the inequities of the system cannot explain the change in governmental norms about military service" (p. 130). Note, however, that she asserts the opposite in an earlier and more theoretical section: "The preferences of the government policymakers and the low-wealth population are the same, thus helping to account for the policies that emerge when the franchise is significantly extended" (p. 118). A similar passage (p. 115) is quoted below. As these statements are not explicitly made about France, I postpone discussing them until later.

Chronology and the facts suggest a close connection between the two reforms. With regard to 1871, the chronology is consistent with the idea that abolition of replacement and introduction of universal suffrage were part of the same ground swell—not that the latter was the cause of the former, but that the two sprang from the same popular sentiment. I know too little about this episode, though, to affirm that there was a link of this kind. I feel more confident in asserting a strong link during the first part of the 1848 revolution. Levi's treatment of this event is confusing. Although she correctly asserts (in her 1997 book) that the constituent assembly voted against a ban on replacement, she also says in AN that "the members of the Assemblée Constituante did overwhelmingly declare support of the abolition of replacement" (p. 128). The two statements can be reconciled by noting the drastic change of mind of the assembly after the June insurrection of the Paris workers. In the first draft by the constitutional commission, presented to the assembly on June 19, 1848 (four days before the insurrection), Art. 107 declared starkly: "Le remplacement est interdit." After the insurrection, the assembly canceled this measure and a number of other radical proposals, notably the right to work and progressive taxation. In this case, it seems clear that universal suffrage and universal subscription were part of the same ground swell, broken only when the bourgeoisie came to see the workers as a threat rather than an ally.

My main complaints with the chapter, however, are logical rather than empirical. I do not agree with Levi's construction of the preferences of the various social groups concerning military service. First, "the traditional elites and wealthy...would prefer a professional army and, second, a system in which they could buy their way out through commutation since, in principle, price is no object. Their third choice would be a system of substitutes or replacements, which would require them to incur some search costs as well as pay a fee" (p. 114). This seems illogical: Search costs and fee add up to a price, which may or may not be higher than in the second case. In the second case the fee is set by the government, in the third by the market, and there is no a priori reason market fee plus search costs should exceed the government-set fee. Also, if "price is no object," why mention search costs at all? Levi also claims that "the preference ordering of unemployed and low-skilled workers and landless peasants should be, first, a volunteer army, then substitution, then universal conscription, and, last commutation" (p. 114). I do not see why this group would prefer universal conscription over commutation. If commutation coexists with lottery, as it did throughout this period, then they would prefer this system (which gave them a chance of not being selected) to universal conscription.

Levi writes in summing up:

If [substitution and replacement tend to dominate universal conscription for everyone], why does so much of the population begin to object to directly purchased exemptions? It may be that, in fact, commutation, substitution, and replacement are not Pareto optimal. As government requires more men to serve, substitution and commutation may increase the probability of having to serve for those who can afford neither of those options. The more people who buy themselves out of the pool of eligibles, the deeper into the pool the army reaches. Thus it may not, after all, be an efficient system (pp. 114–5).

But this argument applies only to commutation. Also, even commutation is Pareto optimal, although, unlike replacement, it is not a Pareto improvement compared to lottery-based conscription.

These preferences are constructed on the assumption that people assessed the alternatives "on purely economic grounds" (p. 114). Levi argues, however, that fairness considerations also entered into the formation of preferences. The existing arrangement

may also begin to be perceived as an inequitable system. Those who cannot afford to purchase substitutes face the possibility of having to become soldiers when they would

rather not; they compare themselves unfavorably both with those who have purchased exemptions and with those who become substitutes instead of draftees and thus receive additional money. . . . If such groups begin to dominate the electorate numerically or resist with riots, then policy change will result (p. 115).

According to Levi, the fairness motive may generate "indirect costs," which salvage "the supply and demand model by expanding the notion of cost" (p. 115).

There are two senses in which considerations of fairness may be taken to generate costs, depending on whether those who harbor such feelings have the right to vote. If they do not, fairness-motivated riots by the disenfranchised may certainly generate costs for government. But if they do, should we say that the feeling of being unfairly treated represents a cost for the low-wealth enfranchised? To answer in the affirmative—as Levi seems to do—would be uncomfortably close to the Ptolemaic devices chastised by Green and Shapiro (1994), that is, people derive psychic benefits from doing their duty. If the feeling of unfairness is conceptualized as an emotion of resentment or envy, then it is inappropriate to view it as a mere cost (Elster 1998b, 1999). If it is conceptualized as a belief that a certain arrangement is wrong, then it need not go together with any subjective feelings of pain at all. Note that in the former case we would expect the resentment of poor conscripts to be directed toward poor replacements rather than toward the rich conscripts whom they replace, on the principle that envy presupposes the belief that "it could have been me" (Elster 1999, chap. 3, section 3).

Weingast's Chapter

The fourth chapter, by Barry Weingast, is an attempt to explain political stability in antebellum America. The central argument can be stated quite briefly. From the Missouri Compromise in 1820 to shortly before the Civil War, American political life was stabilized by a convention that new states would be admitted to the Union in pairs, a slave state and a free state at the same time, thus ensuring (given initial parity) that neither the South nor the North would be able to dominate.

If there were few sustained attacks on slavery—despite its constant presence below the surface as a source of discord—it was because institutions restrained those with the motives to launch such attacks. In light of the potential risk of changes in slavery rights, the South sought to institutionalize some form of credible commitment for the North not to change rights in slaves. The specific form of credible commitment was the convention of equal representation or regional balance in the Senate, giving both regions veto power and, in particular, the South a veto over any policy affecting slavery (pp. 165–6, emphasis in original).

The argument is spelled out in a game-theoretic model that, to the extent I understand it, does not add much to a verbal presentation. If I do not fully understand it, it is not because it is technically complex (it is simpler than other models in the book), but because it introduces a somewhat mysterious plethora of players. I may have missed something, or the exposition may be

the victim of excessive compression from an unpublished book-length manuscript. I shall focus on the simple verbal argument presented above.

What is the evidence for the existence of a convention? Weingast does not cite any relevant statements by contemporaries. Although he claims that "Jefferson clearly understood the principle and its implications" (p. 178), the only backing is a statement by a modern scholar to the effect that an equilibrium obtained. Weingast asserts that "contemporaries" under the second-party system clearly understood sectional balance" (p. 178), but no such contemporaries are cited. The claim that "John C. Calhoun . . . understood this principle" is supported only by a reference to Calhoun's proposal for two concurrent presidents, one elected in the North and one in the South, each with the power to veto national legislation. If Weingast is unable to produce explicit statements by contemporaries to the effect that there was a convention and that they relied on it, then why should we believe there was one?

An answer might be found in a compelling pattern of joint admission of states to the Union. There is, however, no such pattern. Weingast overstates his case: "As revealed by table 4.1, for the next thirty years [after the Missouri Compromise], states entered the Union as pairs" (p. 155). The table shows that the pairs after 1820 were (1) Arkansas and Michigan in 1836 and 1837 and (2) Florida-Texas and Iowa-Wisconsin in, respectively, 1845 and 1846–48. (As a matter of fact, the pairing was more regular before the Missouri Compromise.) This is not a compelling pattern.

If we look at some individual episodes, we may also doubt the existence of a convention. Following the Missouri Compromise, for instance, John Quincy Adams wrote in his diary: "I have favored the Missouri compromise, believing it to be all that could be effected under the present Constitution, and from extreme unwillingness to put the Union at hazard" (cited after Miller 1996, 190). This sounds like a simple one-shot bargain, not the creation of a durable convention. The Arkansas-Michigan admission may also have been little more than a piece of blackmail: "To a degree, as a congressman said, the admission of each state was held hostage to the admission of the other; but really, as another congressman observed, it was more one-sided than that: the admission of the free state of Michigan, about which there was no serious problem, was held hostage to the admission of Arkansas, with its provision of perpetual slavery" (pp. 210-1).

The one-sided nature of the relation between the two parts of the country is underlined by the fact that the North held a majority in the House of Representatives throughout the period. Although Weingast asserts that "the balance rule protected Northerners against the dominance of national policymaking by the South" (p. 151), this is inconsistent with his claim of the "veracity of an important prediction of the model, namely, that antislavery measures should be able to pass the House of Representatives but not the Senate" (p. 168). The North had no need for a Senate veto of antinorthern bills from the House, because its majority in the lower chamber ensured that no such bills would

pass. This feature of the situation is more consistent with one-sided blackmail than with a quid pro quo.

Because I am not a specialist on the period, I cannot offer a persuasive alternative to Weingast's account. Given the facts that he adduces, however, I cannot see that the convention-based explanation is superior to one based on a succession of bargains. The alleged convention is left dangling. What is the mechanism by virtue of which it enabled credible commitments? In a volume that generally tries to spell out the gametheoretic foundations of credibility, it is surprising to see that Weingast does not specify the sanctions that supported the convention. The obvious answer is that if the North had tried to impose its will on the South in matters of slavery, the South would have broken out of the Union. But that standing fact could equally have sustained a succession of deals.

Bates's Chapter

The final chapter, by Robert Bates, is an account of the operations of the International Coffee Organization (ICO) from 1962 to 1989. The main explanandum is the stability of the producer-consumer agreement against free riders on the consumer side. Why did not large American coffee roasters, such as Folgers, break the agreement by purchasing coffee from illicit sources at lower prices? An additional question raised in the chapter concerns the internal organization of the ICO. Here, the explanandum is the allocation of quotas to producer countries.

Bates begins by asking why there was any need for a cartel at all. Why did not the dominant producer, Brazil, try simply to deter other producers from entering the market? Although Selten's chain-store paradox shows that entry deterrence fails when there is full information and a finite number of successive entrants, deterrence can work when there is private information or an infinite number of periods. Bates does not address the strategic use of private information to develop a reputation for toughness to deter entrants (Fudenberg and Tirole 1991, 370). He asserts, wrongly, that reputation effects arise in infinite-horizon games (p. 204). Instead, he argues that the entry of African producers into the coffee market during World War II, whom Brazil could not exclude after the war, turned the market into a one-shot game. Once the African producers had incurred the high fixed costs of planting coffee trees, Brazil could not credibly threaten to drive them out of business by underselling them: "They would be reluctant to uproot their plantations, and instead would simply reduce their inputs of labor" (p. 205). The argument is obscurely presented and relies on an economic model that is unstated rather than explicit.

Next, Bates tells the story of U.S. involvement in ICO. The apparent paradox—why a consumer nation would enter into an agreement to raise prices—is explained by security reasons. After the rise of Castro, "the governments of Brazil and Colombia were able to link the defense of coffee prices to the defense of hemispheric security" (p. 205). Consumer concerns and

electoral preoccupations in the House of Representatives delayed U.S. adherence to the agreement but could not prevent it. Although Bates takes the delay as providing an argument against the realist school of international relations, one might equally well take the ultimate acceptance of the agreement as support for that school.

To explain the stability of the cartel, Bates focuses on the consumer side. In his book-length study of the subject, Bates (1997, 145–50) argues against the propositions that producers were kept in line by Brazilian hegemony, by U.S. enforcement (but see below!), or by redesign of the pricing system to deter free riding. Instead, he argues that stability among the consumers induced stability among the producers. The key element in the explanation is the discount on bulk purchases that Brazil and Colombia offered to large American roasters. The passage linking the discount to the stability of the agreement goes as follows:

[The] reasoning focuses attention on the relationship between those who demanded the agreement (the large coffee producers) and those who organized its supply (the coffee roasting firms). Examining their behavior in a collusive equilibrium, we find that when a large roaster, like General Foods, helped the U.S. government to police illicit shipments of coffee from the competitive fringe—say, Central America-it drove up the price of those coffees. The differential between the price of Colombian and other coffees then declined. Given the differentials in quality between Colombian and other mild coffees, buyers switched to Colombian coffee. As more buyers turned to Colombian coffee, Colombia's dependence on any one given buyer of its coffee declined. The strategies pursued by the parties in the collusive equilibrium thereby lowered the costs to producers of implementing threats to the roasting firms. The reduced costs to Colombia of canceling its contract with any given firm rendered Colombia's threats...more credible. The collusive agreement could therefore become self-enforcing (p. 215, emphasis added).

Once again, the economic model is verbal and implicit rather than explicit, which makes it hard to judge the validity of the explanation. It may be true, or it may not.

The phrase that I emphasized differs sharply from a passage in which Bates (1997, 147) denies the efficacy of U.S. enforcement:

From time to time; the United States followed a second tactic. It signaled to the "competitive fringe" that should they not adhere to the coffee agreement, they would not be eligible for benefits from the Alliance for Progress. While the United States used its aid program to offer inducements and sanctions, little evidence suggests that these measures affected the behavior of nations in the coffee market. Rather, the evidence suggests that such blandishments lacked credibility.

Like the chapter in AN, the book nevertheless asserts the role of the United States in policing illicit shipments (Bates 1997, 152).

One might try to eliminate the contradiction by a suitable interpretation of the claim that the roasters "helped" the United States police illicit shipments. Perhaps the roasters interfered directly in, say, the Central American countries where such shipments

might originate? In that case, the roasters would achieve what the United States could not do on its own by credible threats. This suggestion must be rejected, however, in light of the statement that, "from Colombia's point of view, the discount in the price of coffee to General Foods bought compensating advantages: the help of a large roaster in securing the United States' enforcement of the International Coffee agreement, thereby checking opportunistic behavior by the competitive fringe-and raising the average price of coffee" (p. 214). On a normal reading of this phrase, the roasters ensured U.S. enforcement rather than substituted for it. I have read and reread Bates's chapter in AN as well as his book, but I may have missed something. Even if I have, the need to go through tortuous exegesis to detect exactly what is being asserted does not support the claim that this is an "analytic" narrative. For me, to be analytic is above all to be obsessed with clarity and explicitness, to put oneself in the place of the reader and avoid ambiguity, vagueness, and hidden assumptions. As I have indicated, not many, if any, of the chapters in AN live up to this demand.

In a final section, Bates discusses the internal operations of the ICO. Even when supplemented by other writings (Bates 1997; Bates and Lien 1985; Lien and Bates 1987), the argument is opaque. Bates asserts that one can explain the 1982 adoption of quotas by the ICO in terms of the voting power, as measured by the Shapley value, of individual members. The mechanism for proposing quotas and the constraints on such proposals remain, however, mysterious. In one article (Lien and Bates 1987), there is a reference to a proposal that failed and to a proposal that succeeded, but there is no mention of who made them. By comparing equation 4 in AN (p. 225) and equation 10 in Lien and Bates (1987), we can infer that the successful proposal must have been made by Colombia. (I cannot understand, however, how equation 4 can relate "Colombia's Shapley value to its quota" [p. 225]. Presumably, it regresses the quotas of all countries on the Colombian proposal against their Shapley values.) It might seem (p. 222) that the failed proposal was made by Brazil, but this is inconsistent with the figures offered. On the one hand, under Brazil's proposal, it "would secure over 33 percent of the market" (p. 222); on the other hand, under the failed proposal, Brazil would obtain 30% of the market (Lien and Bates 1987, 631). Or perhaps these percentages are not comparable; I cannot tell.

Bates also asserts (p. 224) that producer countries could make a claim for a quota according to their average exports in one of two three-year periods in the recent past. Which of these two periods they chose was up to them; presumably all countries chose the period in which they had the larger share. If average coffee exports are measured in absolute numbers of tons, then the sum of the individual claims might in theory exceed the total to be allocated. If measured in percentage share of exports, then they must exceed the total when each country can choose the most favorable period. Bates never tells us, however, how much the claims

constrained the proposals. Presumably, they must have left some scope for bargaining—but how much?

Although the Shapley value is uncorrelated with the votes cast on the two successive proposals, and uncorrelated with the allocative quotas in the proposal that failed, it is correlated with the allocative quotas in the successful proposal.

The resolution of the paradox may lie in the following: quotas are established in stages. In the ICO, a proposal is first negotiated, then proposed, and then voted on. It is during the period of negotiations that each nation exercises its bargaining power to shape the proposed allocation. When the proposal is subsequently voted on, however, the nations then appear simply to determine whether they do better or worse under the proposed quota than under the status quo (Lien and Bates 1987, 635).

The claim is not that the Shapley value allows us to explain the outcome of prevote bargaining (and of the subsequent vote). It is the weaker claim that if the outcome of prevote bargaining is correlated with the Shapley value, then the proposal will gain the requisite majority. Is this analysis an application of "rational choice theory" (Bates and Lien 1985, 555, 559)? Apart from the indeterminacy just noted, the use of the Shapley value to explain the allocation of quotas is a deviation from the use of noncooperative game theory in the rest of the book and in the earlier parts of Bates's chapter. The microfoundations of cooperative game theory are by definition shaky.

I am also puzzled by the following statement:

Under the rules of the agreement, bigger producers were endowed with greater numbers of votes; intuitively they should therefore have possessed more power. Equation 5 provides the test we seek. As seen in that equation, the relationship between the voting strength of a nation and its Shapley value is indeed nonlinear; it is quadratic, such that as the number of votes controlled by a nation increases, its Shapley value rises more than proportionately (p. 225).

This seems to be confusing two claims. First, larger nations had more votes (see Bates 1997, 138, for details). Second, the relation between voting strength and power is quadratic, such that when the number of votes rises, the power rises more than proportionately. Even if the Shapley value has been a linear function of the number of votes, the larger producers would have had more power. Further puzzlement is provided by the fact that Bates uses statistical estimation to determine the Shapley value as a function of voting strength, whereas I would have thought that the relation obtains by definition.

It is quite possible that most of these puzzles are just (severe) problems of exposition, not of reasoning. It may seem petty to dwell on them, but I believe the programmatic nature of the volume justifies my doing so.

SOME GENERAL ISSUES

The volume is also beset by some more general and perhaps more serious problems. The objections cited above mainly concern second-decimal issues. Even if the authors had gotten them right, there would still be a number of first-decimal questions to be asked.

The Assumption of Rational Actors

The authors uniformly assume that the main actors acted rationally. With the exception of Levi and Rosenthal (who, albeit not in his formal mode, gives some place to the causal efficacy of religion), they also assume that the actors were motivated by their material interest. In general, of course, rational choice theory can easily accommodate nonmaterial or nonselfish interests. What matters is whether the actors pursue their goals in an instrumentally rational manner, not whether these goals are defined in terms of material self-interest. Yet, even when expanded to include broader goals, rational choice theory is often inadequate because people may not conform to the canons of instrumental rationality.

Let me distinguish between two issues. First, we may oppose rational choice theory as applied by the authors to the paradigm of bounded rationality (e.g., Nelson and Winter 1982) and to the research program variously labeled behavioral economics or quasi-rational choice (Thaler 1991). In the chapters by Greif and Rosenthal, actors (individual and collective) are endowed with the capacity to make very complicated strategic decisions. There is no reference to the fact that for most people the ability to engage in strategic reasoning is severely limited. Consider, for instance, French President Chirac's disastrous call for elections in June 1997. I conjecture that his coalition lost because voters understood that if he wanted early elections, it was because he knew something they did not. something which made him believe that he would lose if he waited. By calling early elections, he revealed what he knew, or at least that he knew something, and therefore gave them a reason to vote against him.

The point is not that this was a failure of rationality on Chirac's part, but that the failure is a very common one. Experiments on the Winner's Curse (Thaler 1992) show that people are very bad at anticipating how behavior may reveal beliefs. In Chirac's case, he did not anticipate that the voters would infer his beliefs from his behavior. In the Winner's Curse, subjects fail to anticipate the beliefs that they themselves will be able to infer from the behavior of others. In both cases, there seems to be a limit to how many inferential steps people can make ahead of time. It is not that it is particularly difficult; it just does not seem to come naturally.

Why, then, should I believe that Greif's Genoans were capable of reasoning through nested games of backward induction, complete with discounting over an infinite horizon? Also, why should I believe in Greif's assumption of exponential discounting when there is "compelling" evidence (Barro 1999, 1126) that time discounting is hyperbolic rather than exponential? It will not do to say that the hypothesis of exponential discounting is a useful first approximation, since it predicts behavior that is qualitatively different from what we would expect on the hypothesis of hyperbolic

discounting. By contrast, the hypothesis of quasi-hyperbolic discounting (Laibson 1997) is a useful first approximation.

Second, the departure from rationality may be much more radical if the actors are motivated by fairness concerns or by emotions. The Ultimatum Game (Roth 1995) is a standard example of a situation in which people are willing to take nothing rather than something, either because they react to being unfairly treated or because they are motivated by emotions of envy or anger. Weingast's chapter, for instance, ignores completely the emotional charge of the slavery issue. Commenting on the congressional debates over slavery before the Civil War, Miller (1996, 184, emphasis in original), observes that "the slavery interest has transmuted into the glorious Southern cause." As he documents, the thinking of the slave owners and their political representatives was seriously distorted by passion. (This may have made their blackmail more credible than it otherwise would have been.) Levi does not ignore these nonrational concerns, although she misdescribes them as rational. Although I know more about seventeenth-century French literature than about the politics of the period, even my scattered knowledge of the latter confirms the overwhelming impression conveyed by the former, namely, that the ruling elites were obsessed with glory and honor. To understand, for instance, the deep pleasure they took in humiliating their rivals, we must read Saint Simon's Mémoires rather than Games and Decisions.

The alternative to the rational actor is not, however, someone who is in the complete grip of passions and completely ignores concerns of security and self-interest. It would be as absurd to deny that the French absolutist kings were preoccupied with revenue as to assert that this was their only concern. They were, in a word, reward-sensitive. That is not to say, however, they were reward-maximizing. Nonrational concerns could often distort their thinking or shorten their time horizon so as to undermine the instrumental efficiency of their behavior. Yet, once their material interests were seriously threatened, they were capable of facing reality. The social sciences today, however, cannot offer a formal model of the interaction between rational and nonrational concerns that would allow us to deduce specific implications for behavior. As mentioned earlier, the idea of modeling emotions as psychic costs and benefits is jejune and superficial. The fact that emotion can cloud thinking to the detriment of an agent's interests is enough to refute this idea. Also, if (say) guilt were simply a psychic cost, then agents should be willing to pay for a pill that would eliminate the emotion-but in reality they would, I believe, feel guilty about doing so.

High Levels of Aggregation

Some of the explananda in the volume are vast historical entities: the development of absolutism, the stability of antebellum politics, the secular expansion of the Genoan economy. Some of the actors that enter into the explanations are huge collectives—clans, the elite,

North, South, and so on. When these are endowed with beliefs and goals and are assumed to engage in complex strategic calculations, credulity breaks down. Rational choice explanations divorced from methodological individualism have a dubious value. Although there may be collective actors who can for practical purposes be treated as individuals, the ones who appear in AN are not—or have not been shown to be—among them.

The most fundamental question is, of course, whether aggregates can coherently be said to have preferences at all. Although social choice theorists have argued that preference aggregation is a fragile business, there may be special cases in which it can be justified. We may be entitled, perhaps, to treat firms as individuals to the extent that they are subject to hard market constraints. Even larger aggregates such as nations may be forced by their own statements to behave consistently. Suppose there is a majority cycle of policies A, B, and C, and that procedural rules lead to the adoption of A, which is then stated publicly as the position of the country. If some of those who formerly preferred C over A change their preference because of the cost to the country of being perceived as inconsistent, even procedural rules that would originally have led to the adoption of C may now simply confirm A. This particular story may not apply to any of the cases in AN. To be taken seriously, however, any account that imputes goal-oriented behavior to aggregate entities has to explain why we should expect consistency in their behavior.

Little Concern for Intentions and Bellefs

One would expect rational choice theorists to take the idea of choice seriously, by looking for evidence that the agents whose behavior they want to explain did in fact have the goals and the beliefs they describe. To some extent, Bates and Levi provide direct evidence about mental states, drawing on interviews (Bates) and parliamentary proceedings (Levi). Weingast tries but fails. The other chapters neglect this aspect of socialscientific explanation. One might say, perhaps, that they are ruthlessly instrumentalist in the Milton Friedman tradition. But to explain observed behavior by intentions and beliefs that are imputed rather than documented is acceptable only if (1) the sources do not permit us to establish intentions and beliefs directly, (2) the observed empirical fit is very good, (3) other implications of the imputed intentions and beliefs are deduced and verified, and (4) plausible alternative explanations are given a good run for their money and then rejected. At the least, I do not feel confident that the chapters by Greif, Rosenthal, and Weingast satisfy these criteria.

Much of applied rational choice theory is a combination of just-so stories and functionalist explanation. One constructs a model in which the observed behavior of the agents maximizes their interests as suitably defined, and one assumes that the fit between behavior and interest explains the behavior. Suppose that higher education tends to make people pay more attention to the future, and paying more attention to the future

tends to make people better off. It is then a tempting step to conclude that people choose higher education in order to reduce their rate of time discounting (Becker and Mulligan 1998), or (in a more general version) that this particular benefit of education explains why it is chosen. It is, however, a temptation that should be firmly resisted, in either version (Elster 2000, 26-9). Unless one can demonstrate an intention (first version) or a causal feedback loop from the consequences of the behavior to the behavior (general version), the coincidence of behavior and interest may be only that—a coincidence.

No Concern for Uncertainty

Except for a minor feature of Weingast's chapter, all the models in AN assume full information. In the real world, of course, high-stake politics is permeated by uncertainty. No model of political behavior that ignores this fact can be successful in predicting outcomes. There are at least five kinds of uncertainty. The first is brute factual uncertainty (will there be a major earthquake in greater Los Angeles over the next decade?). The second is higher-order uncertainty about the cost of resolving first-order uncertainty (do I have time to ascertain the enemy's position before going into battle?). The third is strategic uncertainty due to multiple equilibria (do cartel members play tit-for-tat or sudden death?). The fourth is uncertainty due to asymmetric information (is my opponent irrational or only faking?). The fifth is uncertainty due to incomplete causal understanding (will tyrannical measures imposed by a dictator make the subjects more compliant or less?). The compound effect of these (and perhaps other) forms of uncertainty will, in most complex situations, tend to be overwhelming. At the same time, existing models of decision making under uncertainty, of equilibrium selection, and of games with asymmetric information tend to be very artificial. One might say, perhaps, that it is to the credit of the AN authors that they stay away from these models. Yet, I think the proper conclusion would have been to eschew formal modeling altogether.

CONCLUSION

It is not clear to me what an analytic narrative is. Although the authors deploy rational choice theory, they assert that analytic narratives also could derive from "the new institutionalism...or from analytic Marxism" (p. 3). In the absence of specific examples, I shall understand an analytic narrative as a deductive explanation of individual historical facts, with "fact" being taken in a broad sense that may include long-term developments. In practice, this means rational choice explanation, for the simple reason that rational choice theory is the only theory in the social sciences capable of yielding sharp deductions and predictions. The theory rests on maximization theory, the beauty of which is that it typically yields a unique maximum.

I have argued that the contributions in AN fail to sustain this research program. I have also hinted that,

over and above flaws of execution, the failure may be due to the intrinsic nature of the program. As in the case of sociobiology (Kitcher 1985), deductive rational choice modeling of large-scale historical phenomena may be a case of excessive ambition. But this analogy may be imperfect. In the case of sociobiology, we know from first principles that patterns of animal behavior must have an explanation in terms of biological fitness. The main objection to sociobiological just-so stories is that they are premature, not that some story of this kind will not eventually come to be found. In the seventeenth century Pascal ([1660] 1995, 22) made a similar observation about the Cartesian attempt to create a mechanistic biology: "In general terms one must say: 'That is the result of figure and motion.' because it is true, but to name them and assemble the machine is quite ridiculous—pointless, uncertain, and arduous."

Rational choice history is in a worse situation than that of either mechanistic biology in the seventeenth century or of sociobiology today. The analogy would be appropriate if it were mainly a question of refining the theories and of gathering more evidence. One could refine theory by incorporating bounded rationality and quasi-rational choice, so as to match more closely the way in which actual decisions are made. One could gather more evidence by paying careful attention to sources that illuminate the beliefs and goals of the actors. When we look at the public justifications given for the votes in the first French constituent assembly, for instance, it appears that all deputies had lofty public-spirited motivations. When we read the letters they wrote to their wives, it is apparent that some voted against bicameralism or against an absolute veto for the king because they feared for their life if they did not (Egret 1950). After the publication by Alain Peyrefitte (1994, 1997) of the notes of his conversations with de Gaulle, we can distinguish between what the latter said for public consumption and what really animated his behavior. There is no reason to think that de Gaulle was also being strategic in these conversations, whose substance has been confirmed by his son, Admiral Philippe de Gaulle. By proceeding on these two fronts, one would approach the ideal of explaining behavior by deductive models that rely on (1) realistic assumptions about the way agents make their decisions, given their mental states, and (2) assumptions about their mental states that are independently verified rather then stipulated.

Unfortunately, this will not take us very far. I do not want to insist on the issue of uncertainty. If we can identify the actual beliefs of the agents, we need not worry too much about indeterminacy in rational belief formation. I also do not want to insist on the problem of aggregation. We can proceed from the bottom up to explain the behavior of aggregates of agents, for example, by putting together individual-level explanations of the voting behavior of all members of an assembly to explain the overall vote. In many cases, the voting procedure, including the ways in which alternatives are help up against each other, can simply be taken as parametric. The main obstacle to analytic narratives,

understood as rational choice history, arises at the level of motivations.

As suggested by my earlier discussion, I want to make two claims. First, nonrational motivations are important and pervasive. Wars have been lost because soldiers were taught that it was dishonorable to take defensive measures (Dixon 1976, 54-5). Analyses of why some individuals harbored Jews in Germany or German-occupied countries during World War II whereas others did not suggest that a major factor was that the former were asked by someone to do so (Varese and Yaish 1999). On a rational choice account, this would be a matter of information: To harbor someone, you first have to know about their existence. On an alternative and perhaps more plausible account, it is a matter of the emotional difficulty of refusing a face-to-face request. In war trials after World War II. individuals accused immediately after liberation were sentenced much more severely than those tried for identical crimes two years later (Elster 1998a), which most plausibly can be explained by appeal to the dynamics of anger and hatred. These are scattered examples, which could be multiplied indefinitely.

Yet, if we embrace the most abstract characterization of analytic narrative as deductive history, rather than rational choice history, such facts are not necessarily fatal to the project. To the extent that emotions—their triggering and their dynamics—can be modeled in a way that yields definite predictions, they can be incorporated into an analytic narrative. My second claim, however, is that we do not know how to construct such models. We do not know how to predict the behavior that will occur when an individual is entirely in the grip of an emotion. Fear, for instance, can lead to fight, flight, or freezing, and we do not know which will be triggered in a given situation. We may not even be able to predict which emotion will be triggered. If A favors B at the expense of C, will C feel envy toward B or anger toward A? Also, we do not have good models of the trade-offs at work when emotion and rational pursuit of a goal coexist as motivations. (On all these points, see Elster 1999.)

If pressed, I might have to choose between two versions of the latter claim. Do I mean, à la Pascal, that deductive modeling of emotions is a premature project? Or do I want to state, more strongly, that such modeling will forever remain beyond our reach? Although I incline toward the second answer, my reactions are tempered by previous attempts to legislate a priori what science cannot do-often followed, decades or centuries later, by scientists who carry out the allegedly impossible task. Nevertheless, two reasons make me believe that deductive history will forever remain impossible. First, the micromechanisms, if and when we find them, are likely to be of very fine grain. Second, however assiduously we search the historical record, the evidence is unlikely ever to match the fineness of grain of the mechanisms.

All this is not to say that rational choice theory cannot illuminate historical analysis, as long as its claims are suitably modest. Collective action theory has changed forever the way social scientists and historians

think (or ought to think) about rebellion, revolution, and related phenomena. Hobbes, Tocqueville, and Marx may use language that reminds us of modern discussions of the free-rider problem, but formal analysis is needed to bring out its relation to the subtly different phenomena modeled in the game of Chicken or the Assurance Game. Montaigne and Descartes may have understood at a qualitative level that iterated interactions differ importantly from one-shot interactions, but they did not and could not anticipate gametheoretic results about the conditions under which behavioral differences are likely to arise. Modern analyses of credibility and precommitment have revolutionized our understanding of strategic behavior. The idea of burning one's bridges has always been known, but only after Schelling (1960) has the motivation for such behavior been fully understood. Again, examples could be multiplied indefinitely.

The need for modesty appears in two ways. First, as I have been at some pain to emphasize, one should avoid the postulate of hyperrationality. Collective action, iterated games, and credibility are simple ideas that can be and have been refined to yield rococo (or baroque?) constructions that no longer bear any relation to observable behavior. To be useful, they have to be constrained by what we know about the limitations of the human mind. Second, because formal analysis has nothing to say about the motivation of the agents, it cannot by itself yield robust predictions. Although it is extremely useful to know that the structure of material interests in a given case is that of a one-shot Prisoner's Dilemma, that fact does not by itself imply anything about what the agents will do. If they have nonmaterial or even nonrational motivations, they might behave very differently from the noncooperative behavior we would expect if they were exclusively swayed by material interests. If they are in fact observed to cooperate, then we will have to search for nonmaterial or nonrational motivations. Rational choice theory tells us what to look for, not what we will

In closing, to focus the discussion I might put six questions to the contributors to AN. (1) Do they agree with my characterization of analytic narrative as deductive history and with my statement that in practice this tends to mean rational choice history? (2) Do they agree that a plausible analytic narrative requires independent evidence for intentions and beliefs? (3) Do they agree that a plausible analytic narrative must be at the level of individual actors or, failing that, that specific reasons must be provided in a given case to explain why aggregates can be treated as if they were individuals? (4) Do they agree that standard rational choice theory needs to be modified to take account of the findings of bounded rationality theory and of behavioral economics? (5) Do they agree that it also

needs to be modified to take into account nonrational motivations? (6) Do they agree that at present there is no way to model nonrational motivations and how they interact with rational motivations, at least not in a way that yields determinate deductions?

The Analytic Narrative Project

ROBERT H. BATES Harvard University AVNER GREIF Stanford University MARGARET LEVI University of Washington JEAN-LAURENT ROSENTHAL University of California, Los Angeles BARRY R. WEINGAST Stanford University

n Analytic Narratives, we attempt to address several issues. First, many of us are engaged in in-depth case studies, but we also seek to contribute to, and to make use of, theory. How might we best proceed? Second, the historian, the anthropologist, and the area specialist possess knowledge of a place and time. They have an understanding of the particular. How might they best employ such data to create and test theories that may apply more generally? Third, what is the contribution of formal theory? What benefits are, or can be, secured by formalizing verbal accounts? In recent years, King, Keohane, and Verba (1994) and Green and Shapiro (1994) have provoked debate over these and related issues. In Analytic Narratives, we join in the methodological discussions spawned by their contributions.

In one sense, the aim of our book is quite modest: We hope to clarify the commonalities in approach used by a number of scholars, including us. We do not claim to be developing a brand new method. Rather, we are systematizing and making explicit—and labeling—what others also attempt.¹ In another sense, the aim of the book is ambitious; by trying to systematize we begin to force ourselves and others to lay out the rules for doing analytic narratives and to clarify how such an approach advances knowledge. We realize that our book is only a first step and concur with another of our reviewers: "As a method, analytic narrative is clearly still in its infancy, but it has promise" (Goldstone 1999, 533).

We have an additional aim: to transcend some of the current and unproductive "tribal warfare," especially between the new economic versus historical institutionalists and between advocates of unbounded and

Robert H. Bates is Eaton Professor of the Science of Government, Center for International Development, Harvard University, 79 JFK Street, Cambridge, MA 02138. Avner Greif is Associate Professor of Economics, Stanford University, Stanford, CA 94305-6072. Margaret Levi is Harry Bridges Chair in Labor Studies and Professor of Political Science, University of Washington, Seattle, WA 98195. Jean-Laurent Rosenthal is Professor of Economics, University of California, Los Angeles, Box 951477, Los Angeles, CA 90095-1477. Barry R. Weingast is Ward C. Krebs Family Professor of Political Science, Stanford University, Stanford, CA 94305-2323.

We wish to thank a number of people who gave us very helpful comments as we thought about how best to respond. Yoram Barzel, David Epstein, Michael Hechter, John Perejohn, Bryan Jones, Jim Johnson, Edgar Kiser, Jack Knight, David Laitin, Mark Lichbach, Douglass North, Sunita Parikh, and several anonymous reviewers.

Many others write analytic narratives that combine detailed data collection with rational choice or game theory analyses. Among them are Gary Cox, Jean Ensminger, Kathryn Firmin-Sellers, Barbara Geddes, Anthony Gill, Miriam Golden, Stathis Kalyvas, Edgar Kiser, David Laitin, John Nye, Sunita Parikh, Roger Petersen, and Susan Whiting.

bounded rationality. We believe that each of these perspectives brings something of value, and to different degrees the essays in our book represent an integration of perspectives. By explicitly outlining an approach that relies on rational choice and mathematical models, we do not mean to imply that other approaches lack rigor but, rather, to reveal how to apply our tools in a useful and explanatory way. We wish to join the debate, not claim an end to it.

Part of that debate is among the five of us. Achieving a minimal degree of consensus was no easy task. By including a set of individually authored essays that reveal both our commonalities and differences, we indicate the range of possible approaches while also attempting to create boundaries. The five studies all draw from the same general rational choice approach. Even Levi's norms of fairness are modeled in terms of rational choice (in fact, this is part of Elster's objection). We have accepted rational choice theory and are among those attempting to extend it in historical and comparative research. We are imperialists if that means believing, as Gary Becker did when he applied neoclassical economics to the family and to discrimination, that the domain of rational choice can be usefully enlarged. We are not imperialists if that means believing that rational choice theory is the only possible approach to historical and comparative research.

The central problem we tackle in Analytic Narratives is how to develop systematic explanations based on case studies.2 King, Keohane, and Verba correctly urge us to move toward generalizing. They recommend that scholars first consider how to define the universe of cases of which their case is an element and then attempt to devise a way of drawing a sample from that universe. This is excellent advice. The problem is that, for many studies, their approach is not so easy to apply, at least in the initial stages of research. Many political scientists begin with an interest in a particular phenomenon, such as the American Civil War, the French Revolution, the cause of World War I, the fall of socialism, or the rise of the New Deal. At the beginning of research, before formulation of an account of the phenomenon, the universe of cases containing a case of this sort is not obvious. Indeed, only after acquiring a significant understanding of the phenomenon—that is, only after much if not all the research has been concluded—can a scholar have any prospect for defining the larger universe of events.

² We are hardly the first to attempt this. See, for example, Eckstein 1975, George and McKeown 1985, Lijphart 1971, and Przeworski and Teune 1970.

The five of us, representing two different disciplines, all use the analytic narrative approach to achieve insights into different puzzles in very different historical periods. A major problem we address is how to develop systematic explanations for, and extract valid inferences from, such cases. Each chapter identifies a puzzle unique to the place and period under study, offers an explanation by using the tools of analytic narrative, and lays out the more general questions raised by the specific study. Moreover, in each chapter, the author derives a model and confirms its implications with data.

Greif investigates the growth of Genoa in the twelfth century and accounts for the puzzle of how the podestà, a ruler with no military power, resolved harmful clan conflict and promoted economic prosperity. His case has implications generally for issues of factional conflict and political order. Rosenthal models both long-term and divergent institutional change among countries and offers new insights into the relationship between war and governmental regimes by investigating the differences in taxation in France and England in the seventeenth and eighteenth centuries. Levi accounts for the variation in nineteenth-century conscription laws in France, the United States, and Prussia and finds that changing norms of fairness, resulting from democratization, influence the timing and content of institutional change. By focusing on the balance rule and how it deflected civil war in the United States, Weingast advances the program of understanding the institutional foundations and effects of federalism. Bates analyzes the rise and fall of the International Coffee Agreement; he discovers and explains why during World War II and the Cold War the United States, a principal coffee consumer, cooperated with the cartel to stabilize prices. His major finding concerns the circumstances under which a political basis for organization will trump economic competition in an international market.

Our project represents a means of connecting the seemingly unique event with standard social science methods. First, we model a portion of the critical dynamics in a way that affords tests of parts of the idea. This in itself is worthwhile. Second, we go farther and attempt to use the single case to generate hypotheses applicable to a larger set of cases. It is only in developing the account or model that we are pushed toward seeing what components of the account are testable and generalizable.

Before turning to our response to Jon Elster, it is worth considering his approach to social science. Elster's review attacks all forms of social science explanation that attempt to provide systematic answers to political, economic, and historic questions. Analytic Narratives is simply his current foil. Elster has a very circumscribed conception of what constitutes useful theory. He claims (1999a) that social scientists can do little more than develop a repertoire of mechanisms. His observation of "both the failures to predict and the predictions that failed" has entrenched his skepticism about the possibility of law-like explanations, a skepticism "bordering on explanatory nihilism," redeemed only by "the recognition of the idea of a mechanism

that could provide a measure of explanatory power" (1999a, 2). We, in contrast, believe that although we may not be able to derive general laws, we nonetheless can develop, refine, and test theory-driven models and thus employ theory to gain deeper insights into the complex workings of the real world. Our book features both efforts to employ such models and discussions of the difficulties encountered when doing so.³

ELSTER'S QUESTIONS

Elster poses six questions and an additional set of concerns. The first is: "Do they agree with my characterization of analytic narrative as deductive history and with my statement that in practice this tends to mean rational choice history?" This raises two questions, one about the role of rational choice theory and one about deductive history. Yes, we use and have a preference for rational choice theory, but it is not a necessary condition for an analytic narrative. For example, one could use instead prospect theory or any systematic theory of individual choice, including nonrational theories of choice, to generate the predictions of individual behavior. Aside from prospect theory, however, the alternatives are not sufficiently developed to provide a consistent technique for generating behavior in games.

Turning to the issue of deductive history, we observe that analytic narratives are not deductive histories. In particular, we do not deduce the structure of the game from first principles. Of course, all rational choice models are deductive, but the deductive component, especially when applying game theory, assumes the existence of an appropriate game to analyze. Yet, there exists no finite list of games or any reason to believe that there is one. By the same reasoning, we should not expect to find a French Revolution game, the American Civil War game, or the Genoese game. It is at precisely this point that an analytic narrative relies on inductive methods. We take pains to explain that the process of deciding the appropriate individuals, their preferences, and the structure of the environment that is, the right game to use—is an inductive process much like that used in modern comparative politics, by historical institutionalists, and by historians. Once that induction is complete, we can use the deductive methods to study behavior within the context of the game.

Elster's second question is: "Do they agree that a plausible analytic narrative requires independent evidence for intentions and beliefs?" This can be read as concerning the relationship between rational choice methods and interpretive methods that tell us how individuals construct understandings of their world and give meaning to their life. Much of everyday life and of politics is about this, and rational choice theorists have for too long ignored these concerns. Luckily, there is a critical trend among a subset of rational choice theorists who have been trying to integrate interpretive and

³ A related discussion in sociology was begun by Stinchcombe (1968, 1978) and takes its current form in a debate sparked by Kiser and Hechter (1991, 1998; also see the responses by Quadagno and Knapp 1992; Skoopol 1994; and Somers 1998).

rationalist accounts. An article by John Ferejohn (1991) exemplifies the effort, as does a recent book by David Laitin (1998). Some of our own work (Bates, de Figueiredo, and Weingast 1998; Levi 1997; Rakove, Rutten, and Weingast 1999) is self-consciously part of this enterprise.

To varying degrees the chapters in Analytic Narratives contribute to this program. Each of us has labored for years on the subject on which we write. Where necessary, we learned new languages; where feasible, we worked in the field. Each of us spent long periods in the archives, both public and private, and immersed ourselves in the secondary literature on our subject. Indeed, immersion of this sort constitutes a core part of the method we advocate. We seek not only to bring theory to bear upon data but also to bring data to bear upon theory. We strongly endorse the use of qualitative materials, fieldwork, and the painstaking reconstruction of events as anticipated, observed, and interpreted by political actors. Such intimacy with detail, we argue, must inform the selection and specification of the model to be tested and should give us a grasp of the intentions and beliefs of the actors.

There is also a narrower issue that Elster raises. He argues that without independent knowledge of the intentions and beliefs of the actors, the assumption of rationality adds little, resulting in explanations that are tautological. We disagree with Elster's equation of the words of actors with their intentions.⁴ For example, there are two ways to read James Madison. The typical modern political theory approach takes the text and studies its ideas apart from the historical context, assessing Madison's discussion of an ideal world. In contrast, a historical approach embeds Madison in his context and suggests that he was constructing a political document designed to persuade a certain group of citizens to support the proposed revisions to the U.S. Constitution. It is clear from Madison's own writing that he did not believe in this as the ideal.

The point is that an assessment of Madison's intentions is an enormously difficult and necessarily speculative task. Because it is so difficult to judge intentions, rational choice theorists tend to rely instead on revealed preferences and behavior. Indeed, even in instances in which Elster claims we considered intentions directly, we did not do so. When Levi discusses legislative debates, she understands the legislators' public arguments as behavior; their rhetoric is often calculated and strategic, meant to attract certain constituents or change the votes of other legislators.

Thus, to the specific question of the requirement of independent evidence for intentions and belief, we give a negative answer.

Elster's third question is: "Do they agree that a plausible analytic narrative must be at the level of individual actors or, failing that, that specific reasons must be provided in a given case to explain why aggregates can be treated as if they were individuals?" Highlighting the disjuncture between individual and collective rationality, Elster takes us to task for relying on the use of aggregates: "the elite," "the North," and so forth. "Rational choice explanations divorced from methodological individualism," he maintains, "have dubious value" (Elster 2000, 693).

Whether aggregation is justified depends on the extent to which the problem of decision making within the aggregated unit can be examined separately from the interactions among such units. The question is empirical, not theoretical. Aggregation is widely used in economics and political science because it is often an appropriate assumption that leads to tractable analysis highlighting processes at the aggregate level. Firms and families, rather than rational individuals, long stood on the supply and demand side of the economist's market, and political parties—along with rational candidates—contest Downsian elections. In each case, the aggregation assumption makes the analysis tractable.

In the case of the Genoese clans, for example, there is evidence (apart from the implications of the assumption that such separation is appropriate) that directly supports decision making by the clan. The constraint of "one person, one vote" will lead us away from understanding the politics of Genoa as a republic. The same holds true with respect to other chapters. Should Bates go to the level of the individual American and his/her interest in the Cold War?

At least two of us went farther to explore the institutional mechanisms that produce (in the case of Bates) or that fail to produce (in the case of Weingast) a well-defined preference ordering. Contrary to Elster's claim, then, we do not ignore the paradox of collective irrationality but, rather, employ it as a wedge with which to open the analysis of the influence of institutions.

Collectively, however, we urge caution about taking collectivities as actors, capable of formulating and pursuing coherent and sophisticated strategies. Each of us attempted to move to the highest level of disaggregation that was appropriate; thus, Weingast's unpacking of the Senate and Greif's treatment of free riding in the politics of Genoa.

Elster's last three questions are: "Do they agree that standard rational choice theory needs to be modified to take account of the findings of bounded rationality theory and of behavioral economics? Do they agree that it also needs to be modified to take into account nonrational motivations? Do they agree that at present there is no way to model nonrational motivations and how they interact with rational motivations, at least not in a way that yields determinate deductions?

Long-a student of rationality, Elster advances important arguments regarding our use of rational choice theory. As do others, Elster recognizes that people cannot possibly perform the calculations necessary for backward induction. Instead, he urges us to assume bounded rather than full rationality. He also criticizes the assumption that actors can pursue objectives in an instrumentally rational manner, arguing that emotions and other nonrational motivations play a stronger role

⁴ Despite Elster's attempt to say otherwise, how else can one read his statement that Bates through interviews and Levi through interpretation of parliamentary debates "provide direct evidence about mental states" (Elster 2000, 693)?

than we accord them. Finally, he suggests that recognizing the role of nonrational motivations questions the very possibility of modeling in the way we do.

As a team, we are divided over the first of Elster's arguments; some of us agree and find it increasingly difficult to defend the assumption of full rationality as a "necessary convenience." But even those of us discomfited by this assumption reject Elster's implication. Elster implies that inferences drawn from the use of models that incorporate such assumptions must be flawed, whereas we find some of these models highly insightful. They help us understand just how and why the balance rule worked to preserve political order in the United States before the Civil War; just how and why the rules of the International Coffee Organization influenced the allocation of the "coffee dollar" in international markets; and just how and why an official (the podestà) with just twenty soldiers brought peace and prosperity to the most powerful city-state in the twelfth century Mediterranean world. The burden falls on Elster, then, to show how the assumptions we made led us to err. Just how were we misled by them? How would the outcomes have differed had we assumed boundedly rational actors?

We have no difficultly conceding that emotional life is powerful and affects behavior. We also have no difficulty conceding that a rational choice account grounded only in material interests may be both unrealistic and analytically limited. For Elster's critique to carry more force, however, it is necessary that he show how the inclusion of nonrational motivations would improve the power of our particular analyses. We employed models to explain, not to describe; our models therefore need not capture every feature of human life. The ratio between the variance they confront and the variance they explain provides a measure of their success. Until Elster shows how explicit reference to emotional life and other nonrational motivations would enhance that ratio in the accounts we offer,5 his criticism points to an omission but not to an error arising from that omission. He runs the risk of weakening the power of his explanation. At the least, his argument fails to point out errors of commission, as he suggests.

Elster has been a preeminent advocate of rational choice theory and then of considering nonrational motivations. In social science today, the attempt to develop better models of choice and action represents an extraordinarily important and exciting program, one to which we all subscribe to varying degrees. *Analytic Narratives* is, after all, dedicated to Douglass North, whose recent work focuses on developing better cognitive models (1991; also see Denzau and North 1994), and, among us, Levi in particular is identified with the project of understanding the limits of rationality and rational choice (Alt, Levi, and Ostrom 1999; Cook and Levi 1990; Braithwaite and Levi 1998).

Yet, Elster's program fails what Kenneth Shepsle

once called "the first law of wing-walking," which holds that you do not let go of something until you have a grip on something else. We do not throw out models based on rationality just because we agree that there are nonrational aspects of choice. We are likely to learn quite a bit in the next ten years about how to extend choice-theoretic methods to include emotional and nonrational elements. The approach will be much stronger for this. But we do not believe that this now requires abandoning our current tools. Nonrational approaches to choice are not yet far enough along to provide an analytic approach that challenges or extends the traditional choice framework, at least as applied to empirical research outside the laboratory (see, however, Jones 1999). There are, nonetheless, scholars who are beginning to integrate expressive and rational bases of action. For example, Elster's own work on emotions and social norms (1991a, 1999a, 1999b) explores a range of useful phenomena and mechanisms that will prove useful. Sunita Parikh (in process) explores riots as events whose explanation requires understanding a mix of motivations and behavior. Thus, in contrast to Elster's implied thesis (in question six) that "there is no way of modeling nonrational motivations and how they interact with rational motivations, at least not in a way that yields determinate deductions," we believe that there are good first models of how noninterest-based and even nonrational motivations might interact with rational motivations (e.g., Bates, de Figueiredo, and Weingast 1998; Ensminger and Knight 1997; Levi 1997; Lupia and McCubbins 1998). As these new choicetheoretic approaches become more defined and complete, we believe they can be easily integrated into the analytic narrative framework.

UNCERTAINTY

Having attempted to respond to Elster's questions, we now turn to another major criticism Elster makes in the text, our purported failure to deal adequately with uncertainty. He invites us to impale ourselves upon one of two horns, both chosen by him. On the one hand, he criticizes us for failing to employ models that take into account the effect of uncertainty; on the other, he brands such models as "artificial."

Elster lumps together the separate issues of uncertainty and incomplete information. We use the concept of uncertainty in our chapters more than he recognizes. Consider, for example, Greif's analysis, which takes into account uncertainty about who will win the war, whether the emperor will come, whether the podesta and one clan will ally, and so on.

We are more cautious in applying models of incomplete information, however. Because of their complexity, explicit reliance on Bayesian updating (which we doubt people use in reality), and artificiality, we felt that we should apply them only when failing to treat uncertainty would imply ignoring a central feature of the puzzle under investigation. In most instances, we found we could avoid the use of such models. We, like Elster, believe that political actors occupy a terrain clouded by uncertainty, but we also believe it is char-

⁵ Elster attempts to do this in his 1999 books, but he does not demonstrate there or in his review how his claims produce different analyses than the ones we offer.

acterized by sharp institutional features and powerful political forces. Events that take place in such settings do possess a high degree of contingency. When we give insufficient weight to the role of chance, we deprive ourselves of the opportunity to assess the level of confidence with which we can advocate our explanations. If we succeed in apprehending the major forces at play, then the systematic component of our explanations should prevail over that which is random.

"JUST-SO" STORIES

Elster suggests we are guilty of the very sin we try assiduously to avoid, namely, writing "just-so stories." We admit that it is difficult to elude this problem. In the analysis of a single case in biology—or social science—a just-so story can establish the plausibility of the theoretical perspective, but we resisted the temptation to stop at that point. Instead, we laid out the basis for our analytic decisions, indicated the deviations from the predictions of our initial models, and applied the criterion of falsifiability to our hypotheses.

"We identify the actors, the decision points they faced, the choices they made, the paths taken and shunned, and the manner in which their choices generated events and outcomes" (Bates et al. 1998, 13–4), and we do this in each of the single-authored chapters. We attempt to make clear the preferences and to model the outcome of choices. By this means, we aim to offer both a recognizable historical representation and an explanation of significant institutional arrangements and changes. The analytic narrative approach gains credibility when the equilibria of our models "imply the outcome we describe" (p. 12).

Moreover, "when history contradicts the model, so much the worse for the model" (Goldstone 1998, 533). For example, when a model based only on self-interest fails to account for the change in citizen reactions to substitution and commutation, Levi employs an alternative that permits her to explore the implications of the more narrow with the broader rational choice model. In the Bates chapter, the failure of the chain store paradox model highlighted the significance of high fixed costs in the production function of coffee. The Stigler/Pelzman model also foundered, but its internal inconsistency drove Bates to recognize the significance of security interests and the political role of large corporations.

Contrary to what Elster argues, we do not employ formal theory to construct just-so stories. The theories are tested against the stories, and they can and do fail. From their failure, we then learn about the case. We use deductive theories for inductive purposes. As our introduction and conclusion describe, each of us goes back and forth between the model and the data, testing our ideas against reality.

Elster (1989b, 3–10; 1999a, 1–47) himself makes "a plea for mechanisms," for the necessity to explanation of identifying the causal mechanisms. Elster argues that dozens of potential mechanisms potentially underpin human behavior, which he takes to mean that there is no way to predict ex ante which mechanism will come

into play or, if many are at work, which will predominate. If this correctly characterizes Elster's position, then only after the fact can one suggest which mechanisms work. As a consequence, his method is far more susceptible to "curve fitting" than is our own.

We believe that rational choice offers a superior approach because it generates propositions that are refutable. Being subject to standard methods of evaluation—such as the out-of-sample testing of predictions and the systematic pursuit of falsification—the models we employ are not mere just-so stories.

THE CASE STUDIES

Elster finds much to which he objects in our book. By his own admission, however, much of his specific critique of the chapters focuses on secondary issues. What underlies this kind of criticism, however, is his belief that "to be analytic is above all to be obsessed with clarity and explicitness, to put oneself in the place of the reader and avoid ambiguity, vagueness, and hidden assumptions" (Elster 2000, 691). He argues that "not many, if any, of the chapters in AN live up to his demand," (p. 691). We beg to differ. We feel confident that most readers will find that each author produced an analytic narrative which both advances knowledge and produces generalizable and falsifiable implications. And that formal reasoning was key to these contributions.

Rather than go through each chapter and debate each of Elster's specific second-order charges, we addressed many of his more general and theoretical critiques in our answers to his six questions. There remain a few points to which we need to respond.

Greif's Chapter

Elster argues that the analysis does not support the assertion that external threat or internal innovation released resources for use in cooperative endeavors. He is absolutely correct; the analysis does not support his assertion. But it never attempted to do so. The focus is on a different issue, namely, the *motivation* to cooperate, not the *ability* to do so.

Rosenthal's Chapter

At no point does Elster contest Rosenthal's claim that the conclusions follow from his model or the fit between the implications of the model and the historical records. Changing the division of spoils, the "war bias" of the crown, or the incentives of the elite to free ride would indeed change the predictions that issue from Rosenthal's model and lead to convergence between the policies of England and France, just as Elster claims. But then the modified model would be contradicted by fact and thus proven wrong!

⁶ We all draw on related research available in published and forth-coming material. See, for example, Bates 1997, Levi 1997, Greif n.d., Hoffman and Rosenthal 1997, and Weingast n.d.

Levi's Chapter

Elster's condemnation of Levi's logic rests more on misunderstanding and honest disagreement than on pinpointing logical flaws in her argumentation. Elster maintains that "abolition of replacement and introduction of universal suffrage were part of the same ground swell—not that the latter was the cause of the former" (Elster 2000, 688); this is Levi's explanation, too. He critiques her for holding a different view than his about the relationship between fairness and rationality and a distinct interpretation of the actors' preferences. Elster correctly chastises her for inconsistent wording; price is indeed an object, even in the considerations of the wealthy. But he does not seem to disagree on what is easier or less costly.

Weingast's Chapter

Elster questions Weingast's principal argument that Americans constructed antebellum political stability in part on the balance rule. His main criticism is that pairing occurred because southerners blackmailed northerners by holding the admission of northern states hostage to the admission of southern ones. This assertion supports rather than contradicts Weingast's thesis. The South held up admission of free states precisely to maintain a balance, and it used its sectional veto to do this. Elster's comments therefore add to Weingast's argument by showing how the balance rule was self-enforcing during this period.

Bates's Chapter

Elster criticizes Bates for not showing how the consumer side of the market enforced the agreement. Elster appears to be looking for a unilateral form of intervention; indeed, he cites one attempt (by the U.S. government) and conjectures regarding the possibility of another (by U.S. corporations, acting in Central America). But the very form of the explanations advanced by Bates rest on game-theoretic reasoning; rather than seek forms of unilateral imposition, he seeks behaviors that would prevail in equilibrium.

In short, our responses underscore a larger problem with the review: Elster's repeated failure to engage with the main points made by the essays or his misreading of them.

CHARACTERISTICS OF ARGUMENTS

Elster's criticism of our work is, and was intended to be, powerful. It is a "scorched earth" review, and we have tried to resist the temptation to respond in kind. However, we have, on occasion, felt compelled to answer some of his criticisms with a tone that matches his, especially since much of the power of Elster's critique is due to the substitution of his premises for our own and then showing that our results do not follow. He advances his premises so diffidently that it may not appear reasonable to object, but there is little diffidence in the manner in which he claims to clinch

the subsequent argument, even though the argument that fails is his, not our own.

Elster often substitutes his opinions for our judgments. Admitting that he is not an expert on French politics of the period, he nonetheless feels free to reconstruct the preferences of social groupings, as depicted by Levi. If he cannot see that it would be reasonable to suppose that the groups prefer one form of recruitment to another, then perhaps it is because, unlike Levi, he has not immersed himself in the necessary evidence. Although he admits he is "not a specialist" (Elster 2000, 690) on nineteenth-century American politics, Elster nonetheless feels free to "doubt the existence" (p. 689) of a convention regarding the admission of states to the Union. He is entitled to challenge our logic, and we cannot simply resort to our detailed knowledge of the cases as our defense. But given that we attempted to combine reasonable claims with in-depth research, it is incumbent upon Elster to demonstrate how his alternative and abstractly derived construction matters empirically. At issue is more than a question of taste. At issue is a better or worse explanation of actual events.

Elster repeatedly seeks to ensnare his prey in double binds. On the one hand, for example, he calls for the clarity that only, he claims, a formal model can provide; on the other hand, he then attacks a model—"to the extent I understand it" (Elster 2000, 689)—for failing to add "to the verbal presentation" (p. 689). On the one hand, he criticizes a chapter for deviating from "standard rational choice theory" (p. 695); on the other hand, he condemns the authors for depicting actors as being fully rational. He endorses collective action theory but less than a page later brands collective action theory for being "rococo (or is it baroque?)" (p. 695). The authors are thus damned if they do and damned if they do not.

Elster cites distinguished figures, long dead, to add authority to his arguments, but he often does an injustice to their actual words and meaning. For example, Elster enlists Pascal, applying to our enterprise the phrases applied by Pascal to the mechanistic biology of Descartes: "ridiculous—pointless, uncertain, and arduous." When he wrote these words, Pascal had abandoned philosophy for faith. For our part, we are engaged in secular pursuits, and we take inspiration from history's vindication of Descartes; "mechanistic biology" has proven fertile, yielding major advances in medicine and medical engineering.

Rhetoric helps Elster forcefully communicate his low opinion of our work. The tone is Olympian and harsh, and it diverts attention from his failure to engage with the substance of our cases and our method.

CONCLUSION

Elster criticizes us at three levels. First, he claims that we fail to execute the program we propose; that is, we fail to apply skillfully or persuasively formal theories to elucidate complex cases. We believe him wrong and encourage readers to explore the case studies and decide for themselves.

Second, Elster argues that our framework is itself flawed or, at best, premature; he chides us for "excessive ambition" in attempting "deductive rational choice modeling of large-scale historical phenomena." His real opponent is rational choice theory. But as a critic of the analytic narrative approach, Elster fails to engage with the main purposes of our book: How can we build and test systematic explanations based on case studies? How can we move from the world of a problem to be studied to a test to be administered? Moreover, the analytic narrative method easily affords substituting more general modes of "choice" for the explicitly—and limited—rational choice game theory. Put simply, we believe that the debate over choice versus rational choice is orthogonal to the issues we raise.

The burden is on Elster to explicate a better methodological alternative that can actually inform empirical research. This means demonstrating how the weaknesses of rational choice adversely affect the use we make of it. Unless Elster can show how the assumptions of rationality lead us to conclusions that are wrong, he is merely restating obvious truths rather than uncovering material errors. Unless he can offer us a better set of tools, we shall proceed with those we have.

Finally, Elster criticizes Analytic Narratives because we espouse an ambition to a genuine social science. We believe that generalizations are possible and that many have emerged in the social sciences. Our project represents an attempt to bring some analytical tools to the task of studying unique case studies, a question long of interest to political scientists.

BOOK REVIEWS

Political Theory

Civil Society: The Critical History of an Idea. By John Ehrenberg. New York: New York University Press, 1999. 288p. \$55.00 cloth, \$18.50 paper.

Civil Society, Democracy, and Civic Renewal. Edited by Robert K. Fullinwider. Lanham, MD: Roman & Littlefield, 1999. 408p. \$69.00 cloth, \$26.95 paper.

Alan Wolfe, Boston College

We have passed the ten-year anniversary of civil society, and the end is nowhere in sight. The idea that there is a realm of social life different from either the market or the state received its most visible expression in Eastern Europe, when intellectuals and political activists rallied behind the concept of civil society as they overthrew communist regimes in 1989. But in Western Europe and the United States, the same concept took hold on both the Left and the Right as a way to avoid either the bureaucratic inefficiencies of the social democratic state or the cold indifference of the capitalist market. The contemporary fascination with the idea of civil society has by now lasted long enough to warrant a thorough reexamination, which is what both books under review attempt to do.

John Ehrenberg's Civil Society: The History of an Idea is really two books. One is an intellectual history of civil society that begins with Plato and Aristotle, continues through Cicero and St. Augustine, and then veers off into continental Europe (Kant, Hegel, Marx, Rousseau, Montesquieu) and Great Britain (Hume, Smith, Burke, Ferguson). The second book within a book offers a critique of the idea as it has been applied to contemporary politics in both Eastern Europe and the United States.

Ehrenberg's intellectual history of civil society does not offer an exhaustive scholarly treatment of the thinkers brought up for discussion. Other writers, including Jean Cohen and Andrew Arato and Adam Seligman, have covered much of this ground, and they have a familiarity with European languages that Ehrenberg lacks. But unlike them, Ehrenberg's treatment, concise and well-organized, rarely loses focus. Indeed, considering the range of thinkers discussed, Ehrenberg's treatment of the way ideas about civil society have been discussed in Western political theory is exemplary.

When he turns to the role of civil society in contemporary life, Ehrenberg is, if anything, too focused. For him, discussions of civil society are flawed if they lead to the domination of society by market principles. Looking at Eastern Europe, he is convinced that "it is not 'civil society' that has been restored in Eastern Europe—it is capitalism" (p. 198). Indeed it is, but in the Eastern European situation, capitalism is more hospitable to pluralism than state socialism. Surely it is better to have Adam Michnik editing a newspaper that contributes to open political debate than it is to have Adam Michnik in prison.

Ehrenberg is equally critical of those in the United States who, in the spirit of Tocqueville, urge that we pay more attention to social capital. They fail to realize, he argues, that Tocqueville was writing for a small-scale society far at odds with the global capitalism of today. "In the end," he concludes, "reviving civil society requires the breadth of thought and action that only politics and an orientation to the state can provide" (p. 249). Ehrenberg is certainly entitled to that point of view, but if one takes it literally, there is no reason to discuss civil society at all, since the whole point of the

discussion was to encourage alternatives to reliance on the

Robert Fullinwider's Civil Society, Democracy, and Civic Renewal is a collection of essays and hence lacks the focus of Ehrenberg's book. Most of the essays were prepared in conjunction with the National Commission on Civic Renewal, chaired by former Senator Sam Nunn (D-GA) and William Bennett and directed by political scientist William Galston. Fullinwider's book is distinguished by its wide range. Unlike many volumes that deal with civil society, it includes chapters that examine the international context. It adds historically oriented essays by Kathryn Kish Sklar and Kathleen McCarthy. In other chapters, philosophers examine such issues as the role of public journalism (Judith Lichtenberg) and virtue and vice (Loren Lomansky). Unfortunately, the editor does not offer an essay-length introduction that provides an overview of all the diverse approaches, and conclusions, represented in the book. The result is a series of very uneven contributions, some quite outstanding and some not.

One key question that has emerged from the academic discussion of civil society is whether the term should be reserved for groups, organizations, and movements that serve particular political objectives. Two of the essays argue that it should be. For Benjamin Barber, the whole point of civil society is to encourage strong democracy, which he defines as "an understanding of citizenship conducive to civic revitalization and democratic engagement" (p. 24). Barber has in mind groups that deliberate over policy and activate their membership, such as the Industrial Areas Foundation or the Oregon Health Parliament. The more specific Barber becomes, the clearer it is that, for him, civil society supports one particular side in political controversies and not another. For example, Barber would like to see more efforts at campaign finance reform, environmental protection, and limits on advertising, which suggests that groups who lobby against those goals are somehow diminishing civil society. The problem is that we rarely know in advance which policies will enable civil society to flourish and which will not. Campaign finance reform could indeed revitalize elections, but it could also put a damper on political information.

Barber is at least aware that conservatives as well as liberals have a stake in seeing civil society flourish. Jean Cohen is not. Her essay is dedicated to the proposition that all those who worry about declining social capital "will play into the hands of social conservatives" since their view of the problem is "theoretically impoverished and politically suspect." For Cohen, an organization must be democratic inside if it is going to strengthen democracy: "Hierarchical, authoritarian associations such as the Mafia can easily generate skill in strategic action; the Catholic Church can generate loyalty. But I suspect that only associations with internal publics structured by the relevant norms of discourse can develop the communicative competence and interactive abilities important to democracy" (p. 63).

For Nancy Rosenblum, Cohen's comments on the Mafia and the Catholic Church would constitute a violation of the principle of indeterminacy. As she argues in her chapter in the Fullinwider book, and more extensively in *Membership and Morals* (1998), "The moral valence of membership is neither simple nor predictable" (p. 265). If Rosenblum is right than even membership in hate groups offers moral benefits to members, then surely Cohen is way off base to question whether Catholics can make good democratic citizens. The whole point of civil society is to create spaces in which people decide for themselves the hows and whys of politics. It is a sad commentary on the state of the Left that writers such as Cohen and Ehrenberg, who so distrust

political expressions with which they disagree, leave little room for genuine politics from below. Interestingly enough, the same cannot be said of one of the conservatives represented in the Fullinwider book. William A. Schambra of the Bradley Foundation writes in support of localism and finds common cause with localists of all political colorations, including those on the Left.

One other essay in the Fullinwider book that deserves serious attention is Fredrick C. Harris's chapter on African-American civic life. Responding to Cornel West's assertions that a strain of nihilism runs throughout African-American social behavior, Harris demonstrates the vibrancy of civil society among black Americans, particularly those who have achieved middle-class status. His essay effectively proves the importance of class in matters dealing with race, yet it also oddly concludes with a backhand endorsement of West's argument. Harris's data show "that crvic life has virtually disappeared in poor black communities" (p. 334).

In one form or another, civil society is here to stay. There must be a reason so much attention has been paid to Robert Putnam's "Bowling Alone" (Journal of Democracy 6 [January 1995]: 65–79) or why so many political theorists, such as William Galston and Michael Sandel, have touched a public nerve. To be sure, critics of the nostalgic attitude taken by some of civil society's advocates are correct to raise questions about whether civic life has really declined and whether new, and vibrant, forms of civic participation have emerged. Still, as the historical sections of Ehrenberg's book show, the great political philosophers of the past sharpened their ideas by applying them to the political transformations through which they lived, and that is very much what students of civil society are doing today.

Enemy in the Mirror: Islamic Fundamentalism and the Limits of Modern Rationalism. By Roxanne L. Euben. Princeton, NJ: Princeton University Press, 1999. 239p. \$49.50 cloth, \$16.95 paper.

Cyrus Masroori, University of California, Riverside

For more than twenty years the resurgence of Islam, and especially its "fundamentalist" manifestations, has instigated both fascination and fear in the West. Yet, despite a significant body of inquiries and examinations by policymakers and students of politics, some important questions about political events in places most affected by this Islamic revival, from Afghanistan to Algeria and from Iran to Sudan, remain without satisfying answers. In particular, we still have little to say about how Islam has inspired and mesmerized tens of millions of people, many of whom would readily give their life for the sake of ideas and values that to most average citizens of the West may appear archaic and irrational.

It is against this background that Roxanne Euben initiates an ambitious project and takes a creative approach to reevaluating Islamic fundamentalism as a set of ideas without preconceiving them as inherently archaic or idiosyncratic. In an engaging journey, Euben attempts to answer some of our urgent questions about the meaning and appeal of fundamentalist ideas. After pointing to some problems common to many Western studies of Islamic fundamentalism, Euben offers an account of the method she finds adequate in studying the topic. She uses this method to examine important political beliefs of a leading Islamic fundamentalist, Sayyed Qutb (1906–66). Euben then locates Qutb's thought in a context that includes another well-known fundamentalist (Ayatollah Khomeini), two Islamic modernists (Sayyed Jamal al-Din al-Afghani and Muhammad 'Abduh), and several

Western critics of modernity (including Hannah Arendt and Charles Taylor).

It is particularly refreshing that the book includes a rather extensive methodological discussion, which is frequently neglected by studies of Islamic fundamentalism. Euben begins with a critique of post-Enlightenment rationalism and its social scientific models, such as modernization theory, class analysis, and rational choice. These models generally assume that the process of urbanization, expanding education, and industrialization in Islamic society leads to alienation, which makes Islam, and particularly its fundamentalist form, appealing.

Such models actually distort Islamic fundamentalist ideas by irrationalizing them. One dimension of this distortion is to separate an "essentially" secular West from an "essentially" antisecular Islam. An extension of this distortion is to make fundamentalist ideas subject to categories outside the model's worldview, which leads to marginalization of what defines the very significance of their movement to the fundamentalists.

The alternative, according to Euben, is a dialogic model that recognizes meaning and function are "mutually determinative." Without a grasp of what fundamentalism means to the adherents, we cannot adequately explain what they do. The prerequisite for such understanding is to let Islamic fundamentalist thought express itself. Only then we can seek commonalities, allow the fundamentalists to engage in a dialogue in behalf of their own ideas, and hope for a better understanding of the intrinsic appeal of those ideas.

Guided by the dialogic model, Euben examines some writings of Sayyed Qutb, one of the most widely acknowledged "ideologues" of Islamic fundamentalism. Euben intends to (1) provide evidence for the failure of rationalist models to explain fundamentalist ideas and practices; (2) represent an example of Islamic political theory that is not created by imposing "Western constructs to interpret non-Western cultures" (p. 52); and (3) explore how Qutb's thought was "constrain[ed] and frame[d]" by the "experiences of his life" (p. 56).

Euben begins with Qutb's Ma'alim fil-Tariq [Signposts along the road], which revolves around the concept of Jahlliyya (jahl = ignorance). This refers to the period right before the revelation of Islam, not because human beings were deprived of rationality or unaware of its application to understanding the physical world, but because they were ignorant of the true God (Allah) and His laws (Shari'a), which represent the only right way of living. Modern Muslims have fallen back into jahulyya because they ignore the sovereignty of Allah and His laws.

Modern ignorance, Qutb suggests, is a product of adopting post-Enlightenment rationalism and the political theories and regimes it has spawned. Although he finds no fault with applying reason to examine the physical world, Qutb rejects rational inquiry into "'whys' of the universe," particularly those questions concerned with the essence and purpose of human existence. The latter inquiry has proclaimed a false completeness and competency for human knowledge, portraying religion and revelation as irrelevant and obsolete. Modern jahiliyya is not limited to the West, since many Muslims have accepted and adopted the philosophical conclusions of Western rationalism and are subject to the tyranny of political regimes based on that philosophical ground.

Euben gives a brief review of Qutb's treatment of such topics as the Islamic state, freedom, equality, gender, and race, and she makes frequent reference to his other writings, such as Social Justice in Islam, but the center of attention

remains on Signpost and the concept of jahiliyya. It is mostly because of this concept that Qutb stands separated from and even in opposition to the Islamic modernists of the nineteenth and early twentieth century.

Typically, Islamic modernists such as Sayyed Jamal al-Din al-Afghani explain the decline of the Muslim community as a result of "neglect of science and philosophy" (p. 97), so it is not surprising that Qutb rejects Islamic modernism as an "apologia for Western dominance" (p. 93). Yet, despite such differences, Euben is on target when she reminds us that both Qutb and Islamic modernists are engaged with "Western frameworks and ideas," whether they redefine or criticize them (p. 116). Meanwhile, the basic assumptions of jahiliyya bring Qutb into ideological proximity with Khomeini. Both are hostile toward "rationally acquired" knowledge about essential questions of life, since such knowledge can only be sought in revealed truth.

Although Qutb refuses to describe the institutional arrangements of an Islamic state on the ground that it degrades Islam to the level of man-made political theories, he provides a general prescription for overcoming jahili society. Such emancipation requires jihad, holy war, which aims at liberating human beings from tyranny by establishing a true Muslim society. In such a society, everyone lives and participates according to the laws of God and consequently is free from the tyranny of other men. Euben's suggestion that jihad "had, over time, fallen into disuse [and]... Mawdudi was the first to stress the imperatives of jihad for contemporary Muslims" (p. 74), requires qualification, since in fact the concept was revived in Iranian political discourse in the early nineteenth

Although Qutb's political thought may at first appear alien and impenetrable to a Western reader, Euben persuasively argues that such a reader can successfully interpret his writings. This is possible in part because Qutb himself was influenced by Western political ideas. Euben points to a number of arguments by Qutb that are reminiscent of such Western philosophers as Plato, Rousseau, and Marx. She correctly points out that in the postcolonial world, it is not surprising to find Qutb in part influenced by and responding to debates that are basically "Western." This is important in allowing Western students of Islamic fundamentalism to participate in a dialogue with Qutb. They will find Qutb's arguments less alien if they review the writings of some of the Western critics of modernity.

Euben presents brief sketches of how six contemporary Western thinkers find a crisis of modernity related to Enlightenment rationalism. The review covers Hannah Arendt's examination of the decline of authority, discussions by Alsdair McIntyre, Charles Taylor, and Richard Neuhaus about the modern crisis of morality; and arguments by Robert Bellah and Daniel Bell regarding the decline of community. Euben compares the views of these authors to one another and to Qutb's critique of the modern West, in each case pointing to the differences and similarities among them. The valuable lesson here is that an important requirement for expanding our understanding of Islamic fundamentalism is to situate it "within an extensive and ongoing critique of modernity and the processes that define it" (p. 151).

Because of the book's concern with method and its original questions and insights, *Enemy in the Mirror* is a valuable and innovative project in comparative political theory. Some of the important points Euben intends to make receive only brief attention. For example, one of her goals is to explain the attraction of Islamic fundamentalism based on the intrinsic power of its ideas, but one is left with the impression that this power is almost entirely based on its critique of Western

modern rationalism and the way that it constructs and explains political structures and phenomena.

Another important suggestion made by Euben is that "the experiences of [Qutb's] life and the moment in which he worked constrain and frame the dynamics of his political thought" (p. 56). Yet, Qutb's life, including the intellectual experiences of his youth, receives very little attention, and the social, political, and intellectual environment in which he acted are largely unexamined. Nevertheless, Euben provides valuable points of departure for future research.

The Politics of Judgment: Aesthetics, Identity, and Political Theory. By Kennan Ferguson. Lanham, MD: Lexington Books, 1999. 153p. \$40.00.

John Seery, Pomona College

Is there anyone out there in Political Science Land who still believes in rational choice, not just as an occasional or even frequently useful research tool, but as a true description of normal human behavior? Perhaps, but such people probably are not avid readers of novels. The thick descriptions found in great literature, as with the best in historical writing, usually attest to the unique, complex, unfixed, and irreducible character of human events and their subjects. Distinguishing between idiographic and normothetic forms of knowledge, Max Weber wanted modern social science to attend to the unprecedented and idiosyncratic, even illogical, particulars of human behavior—as opposed to behavior that readily admits to ordered and rule-governed classification. It is fair to say that contemporary political science, however, has largely not followed Weber's lead; accordingly, literary approaches to the study of politics have been shamefully relegated to the outermost margins of the discipline.

In The Politics of Judgment, Kennan Ferguson does not explicitly confront the prevailing predilections of rational choice analysis, and he is not recommending a novelistic method in its stead. But like a well-read Weberian, he turns to aesthetics to recover a complicated, contestatory understanding of politics. The study of politics is fascinating at least because political actors often seem to be guided by manifold motivations that defy summary explanation. For Ferguson, the modern philosophical field of aesthetics, which recognizes the underlying complexity involved in how people go about making judgments, can offer modern political science some valuable and sorely needed lessons. Focusing on judgments allows us, suggests Ferguson, to escape the rationalirrational dichotomy. Judgments, as Kant substantiated in Critique of Judgment, are often made on the basis of taste, not interest, and such tastes involve processes and decisions that are contingent but are nevertheless not merely arbitrary or subjective. Judgments based on taste seem to reflect community or cultural standards that are somehow insinuated within and presupposed by individual preferences. Aesthetics as a field attempts to track the subtle negotiations and interconnections between individual and community tastes, and thus it offers to political theory more sophisticated insights into the gray zones of human alliances. "Judgments are the basis of political identities" (p. 1), Ferguson declares, and aesthetics is the scholarly field best prepared to explore those shifting tides.

Ferguson well knows the dangers commonly associated with attempts to link aesthetics with politics. Aestheticized conceptions of politics can be overly precious or prettified, and wondrous attempts to lend artistic grandeur to the business of governance all too often prove utterly disastrous. History is sadly replete with examples of the visionary

seduction whereby cruelties are executed in the name of art. But Ferguson dismisses such concerns with easy dispatch. Because his political interest in aesthetics is not concerned with questions of the form or content of the artwork, or with issues of the proper meaning and uses of such productions, he avoids all the customary misconceptions and their attendant traps. Rather, his use of the term aesthetics derives from Kant's famous investigation into the public nature of judgment. Kant was the first philosopher to insist on the shared and contested nature of judgment. For Kant, judgments of taste appeal not to standards of truth but by a similar token are usually not reducible to mere subjectivism. They often seem to presuppose various communities of common albeit internegotiated sensibilities. These economies of judgment are not legislated but, for Ferguson, are nevertheless "political" insofar "as they involve the contestation between individuals and groups over ways the world is understood" (p. viii). Political identities are thus based more on judgments than on contracts, and we should first plumb the politics of our constitutive agreements and differences in order to understand our outward allegiances.

Ferguson is clearly on to something big. He is quite right to reacquaint us with a neglected Kantian tradition, suggesting that we should look for political instruction more in Critique of Judgment than in Critique of Practical Reason. He has gathered together an impressive array of political thinkers— Nietzsche, Wittgenstein, Arendt-whose political theories seem to have been greatly influenced by Kantian aesthetics. In respective chapters, Ferguson deftly points to Kantian and Nietzschean combinations in Arendt's mature thought; Kantian and Wittgensteinian combinations in Pierre Bourdieu's tome on taste; and Wittgensteinian and Nietzschean aesthetic influences on later Foucault. All these seminal thinkers reject claims of truth as the appropriate standard for politics, yet all renegotiate, according to Ferguson, shared aesthetic judgments, although in different ways. Ferguson explicates and intervenes in each account (and one can take issue with particulars in each account). In the end he refrains from trying to resolve the differences into a unified aesthetic theory of politics.

The Politics of Judgment is hugely ambitious, and a great deal of territory is covered in a very short book. Middle chapters examine the importance of aesthetics in, respectively, the racialized politics of multiculturalism, foreign policy and nationalism, and the identity politics of gender/sex distinctions. Such topics frequently lend themselves to abstruse expositions, but Ferguson's prose is a welcome model of concision and clarity. Yet, because he attempts far too much, he must take liberties and shortcuts. Often he argues by relying on the testimonies of other authors, and such casual citationality seems pitched not to potential skeptics but to the already converted. In one short stretch (pp. 80-2), he marches through the works of Carol Gilligan, Laura Mulvay, Jacques Lacan, Judith Mayne, Teresa de Lauretis, Kaja Silverman, and Catherine MacKinnon. The result seems squeezed and schematic, the argument asserted but never demonstrated. The book does not enact the agonistics it wants to showcase, and thus its own aesthetics seem strangely at odds with its subject matter.

The finale urges us to view aesthetic judgment as a form of political action, and therewith Ferguson invites us to consider "dissident" aesthetics as politically efficacious. He proposes that cultural disputes over fashion, music, and language need not be liberatory in a Bahktinian sense in order to be transformative and "world-creating." In short, the aesthetics of interpretation can be political, a conclusion that may strike some as a bit vanguardish. Ferguson responds by insisting

that political aesthetics need not be confined to a highbrow elite, although surely his own book betrays that point. *The Politics of Judgment* brims with many admirable traits, but one suspects it will remain an academic work in search of a wider audience.

Living with Nature: Environmental Politics as Cultural Discourse. Edited by Frank Fischer and Maarten A. Hajer. New York: Oxford University Press, 1999. 269p. \$27.50 paper.

Tim Hayward, University of Edinburgh

Environmental concern has become firmly established on the mainstream agenda of international politics. Central to global strategies for dealing with environmental problems is the goal of sustainable development. International agreement about the desirability of this goal has coalesced because it appears to hold out the promise of a win-win scenario, whereby economic development can continue while its environmentally harmful consequences are avoided. Yet, when it comes to devising and implementing appropriate policies, that promise remains largely unfulfilled.

One aspect of the problem is that economic and environmental interests do continue to conflict in significant ways. Moreover, the relative importance of particular environmental goals is seen differently in different parts of the world, with striking contrasts in perspective between the richer and the poorer countries.

According to Fischer and Hajer, however, the problem is not only an opposition between development for the poor and conservation for the rich; if current strategies of sustainable development do not live up to their promise, this also has partly to do with how the goal itself is construed. The dominant "discourse coalition" of sustainable development is essentially a "managerial" one and has a global sphere of reference; in both these respects, they believe, it is vulnerable to criticism. On the managerial approach, environmental problems are supposed to be identified by objective scientific means, and technical solutions then are proposed to deal with them. Existing institutions are adapted to this task of implementation, but an argument of this book is that "an institutional approach that purports to deal with the challenges of environmental degradation, while leaving aside basic cultural and political questions about the institutions implicated in producing the crisis in the first place, has become very vulnerable to radical critique" (p. 5). As for the global turn in environmental politics, they claim, this involves a dramatic reduction in the complexity of the problem and thus does not provide an adequate basis for arriving at solutions. Moreover, this new global environmental discourse "has suggested much more unity and shared understanding than can be legitimately assumed" (p. 9).

A better approach to environmental policy, the authors believe, would pay more attention to cultural politics, that is, to "the particularity of the way societies relate to the natural environment" (p. 6). The dominant managerial discourse of environmentalism is grounded, they believe, in a set of specific cultural assumptions that are not universally shared and that do not merit unqualified endorsement. Thus, a stated aim of the book is to examine critically the various practices through which particular ways of relating to nature are reproduced so that the cultural underpinnings of present strategies may be politicized.

The book is divided into three parts. The first consists of chapters offering general considerations about the social construction of understandings of the natural environment. A

central message is that, although one should heed the fundamental ecological insight that humans are, after all, part of nature and not something apart from it, one should not forget that the ways humans actually understand and relate to the rest of nature are deeply permeated by specific cultural interpretations and values. Thus, Yrjo Haila says the challenge for environmental politics is to retain an awareness of the earth as a whole without losing our sensitivity to the cultural particularity of entities, processes, and situations.

The second part considers specific cases of how contrasting understandings of the natural environment are constructed. The contributors seek to show, for instance, how science is used to impose a particular cultural view of nature upon local communities. Peter Taylor's case studies from Mexico and Africa illustrate some ways in which scientific techniques simplify reality in an effort to control the multiple manifestations of complex phenomena. To uncover the processes through which such simplifications occur, he suggests, we need to investigate the cultural politics involved in constructing scientific knowledge. From the chapters of this part, a strong suggestion emerges—in keeping with much current environmental political theory—that a more discursive democratic politics is an important part of the answer to an equitable approach to environmental protection.

Part 3 has contributions on environmental politics in relation to cultural difference. David Harvey provides a particularly useful overview of the principal environmentalist discourses to be found today. He offers an exposition and critique not only of "standard" managerialist discourse but also of positions of more radical green groupings. His main interest, however, lies in theorizing the prospects and problems of the environmental justice movement, both as manifest within U.S. politics and as linked to a more global "environmentalism of the poor." He indicates various ways in which socioeconomic disadvantage are reproduced and reinforced through discursive framings of environmental issues, which at times are tantamount to "cultural imperialism." Nevertheless, on Harvey's account, contrasting cultural construals of environmental problems are firmly grounded in fundamental issues of national and international political economy. A particularistic politics of place is not in itself the answer unless or until harnessed to a more universalistic movement that comprehends and seeks to take on the systematic obstacles constituted by the global capitalist order: "The fundamental problem is that of unrelenting capital accumulation and the extraordinary asymmetries of money and political power that are embedded in that process" (p. 184).

This is a useful reminder that much of what is relevant about cultural differentiation and particularity is relevant precisely because of underlying relations of oppression and exploitation. This point is not always so evident in discussions of environmental politics as cultural discourse.

The book is intended to counteract aspects of abstraction in environmental discourses by attending to concrete particularities of diverse cultures. Yet, any general theory of the importance of particularity has to be alert to potential paradoxes about its own status. To my mind, not all contributors show sufficient alertness. Recommendations about what a sociologically nonspecific "we" need to do or learn crop up more often than one might expect in a book of this kind; some contributors effectively advocate their own preferred view of, or alternative to, sustainable development; others advocate a restoration of "spiritual traditions" or establishment of an ethic of "partnership with nature" whereby "Nature, along with women and minorities, will speak in a different voice" (p. 223). The editors themselves

evince a nostalgia for the earlier (affluent Western) green discourse, which emerged as a countercultural "critique of industrial progress" and of "endless material growth and consumption." Yet, if the most relevant cultural differences apply to those who have hardly even started to enjoy growth and may in fact have all but stopped consuming, it may be somewhat premature or overly sophisticated to speak, as they do, of transcending "the old, simplistic opposition between development for the poor and conservation for the rich."

Meanwhile, whatever the shortcomings of the dominant discourse of sustainable development, it has ushered environmental concern onto the mainstream agenda; it does at least embody some recognition in principle of the issue of equity; and its institutions do engage to some extent with realities of economics and political power. Although the discourse of sustainable development may indeed be vulnerable to radical critique, the question remains as to where, concretely, that critique may lead. Essays extolling in a general way the virtues of attending to particularity I found less rewarding than those that focus on specific cases of contrasting understandings. Yet, when it comes to cases, the striking differences alluded to in general arguments appear rather more nuanced; and where striking differences do indeed appear, they often can be-and perhaps most usefully are-comprehended as questions primarily of injustice. This is not to deny that specific cultural values and assumptions can be both a source and a medium of oppression; and the most valuable parts of the book reveal how this is the case. But going too far down the cultural theory route risks obscuring the woods for the trees: Some issues of environmental justice may centrally involve contrasting cultural interpretations, but many of the most serious environmental problems afflicting the world, especially its majority poor population, seem evident enough without extensive cultural analysis. Still, if that analysis proves helpful in devising specific solutions, it is of course to be welcomed. I would thus commend this book for its central aims, which are well conceived, and for those contributions to it that most faithfully pursue them.

The Theater of Politics: Hannah Arendt, Political Science, and Higher Education. By Eric B. Gorham. Lanham, MD: Lexington Books, 2000. 235p. \$65.00 cloth, \$24.95 paper.

Gordon Tolle, South Dakota State University

Although the title suggests this work will examine the philosophy of Arendt, Gorham instead focuses on applying Arendt's distinctive conception of politics to various topics, especially the college classroom. He is deeply concerned about the loss of citizenship in the United States (p. 22). He raises important issues for the development of civic-minded citizens, advocating that political science faculty make the classroom more a place of student practice of politics and the activity of political judgment, that is, give students the opportunity to "appear in public" (p. 195). While good citizenship requires active involvement, most citizens understand politics only as spectators (p. 1); Gorham believes Arendt's theory frames action "in particularly useful ways" (p. 3). He offers good suggestions on how to engage students in class and how to structure some out-of-class experiences.

This book is organized into an introduction, eight chapters, and an appendix. It analyzes the idea of politics as theater; examines "reporting" and the relation of "facts" to politics (including the Eichmann trial); applies Arendtian ideas of citizenship to the university; applies Arendt's council-democracy to the European Community; examines the idea of space of appearance; discusses the practice of political action in

class; and suggests ideas about out-of-class community service. Gorham hopes "to bring out meaning in [Arendt's] work" (xvi, n. 1) by viewing the university as an opportune place for citizens to develop the capability of judging political action. Although much of the analysis depends on applying an interpretation of Arendt, Gorham only tangentially analyzes Arendt and her interpreters and critics. He believes the political science faculty ought to stimulate students to "enlarge their mentality" and "make informed and reasoned judgments" (pp. 94, 96).

A good application and critique of Arendtian theory is provided in the chapter that applies the Arendtian notions of political action and council-democracy to the development of the European Community. Gorham differentiates "movement" politics from political parties, noting that European parties are more successful in answering the "social question." Parties represent interests, not "opinion or action," and are less "political" in Arendt's sense than the movements (p. 119). Gorham observes that the practice of discussion can contribute to the demise of free public spaces because certain forms of discussion "transform free spaces into bureaucratic ones" (p. 119). He finds that Arendt's theories apply well to the early postwar European "space of appearance," but her theory fails to "account for the difficulty... of creating stable, free, democratic spaces of appearance" (p. 116). One is left to wonder about the consequence for our understanding of Arendt's theory. Does Arendt not put enough emphasis on institutions? If Europe's democratic deficit is related to a flaw in Arendt's theory, is the missing element a lack of analysis of character?

If it is a defect of Arendt's theory that foundational and revolutionary spaces can ultimately destroy themselves, why does Gorham proceed to apply Arendt's theory to the classroom? He recognizes that Arendt did not believe that classrooms were spaces of appearance (p. 156). Assuming one could choose to extend her theory of politics as theater to the classroom, there may be valuable insight from recognition of theatrical aspects of classroom teaching. When faculty present differing, "often opposing interpretations," they are not merely imparting "truth" but exploring the meaning, the significance of political action (p. 162). For Gorham, a teacher who questions a text and performs a dialogue "presents the author as an actor" (p. 163). This technique is an attempt to get the student to develop "a taste for thinking." Unfortunately, this is not Arendt's view of "action," which would require the living, talking author to "appear" before the students. Gorham does not suggest we do away with lectures, but that faculty should offer in-class opportunities for role playing and political action (pp. 166, 167). In my view, the more valuable part of this exercise for the student may be to see the teacher as thinker, questioning the meaning of the text, not as actor.

Gorham believes faculty must "politicize" the classroom, which means to heighten students' awareness that they "are engaged in some artificial practice" (p. 167). This would include encouraging student participation in the university's academic policy process (p. 172) and recognizing the economics of the student's relationship to society (pp. 167-8). Yet, as Gorham points out, Arendt did not want the economic, social, and "administrative" questions to impinge on what she conceived as purely "political action" (pp. 54, 118, 145). Community-service learning can be valuable, says Gorham, because it teaches "how to act, in the Arendtian sense," although he notes there is no guarantee of political learning or of civic virtue (pp. 183, 188-9). The author is aware that a possible outcome is mindless activism, and he wants to build in "incentives" that would help students stop

and think about what they are doing (p. 198). I wish he could have been less vague about how to accomplish this thoughtfulness.

Several issues can be raised about the book. First, although Gorham correctly describes Arendt's distinctive view of 'politics," he does not adequately examine her intentional disparagement of economics and administration. Does this detract from the adequacy of her theory to conceptualize politics? Are there unintended normative consequences? Second, there is a serious problem with Gorham's call to politicize the classroom (for Arendt this does not simply mean partisanship): To what degree is student "practice" of politics going to inculcate good judgment? Yes, Gorham wants students to experience the "vita contemplativa" (p. 160), but what more is this than the time-honored attempt to develop critical thinking skills? Do we really want to politicize our classes and our research (pp. 106, 157, 184)? Third, Gorham wants students to develop judgment and is aware that they need practice. But what does it mean to say citizen decision making should be based on "taste and enlarged mentality of the person judging" (p. 107)? Finally, politics to Gorham is an expressive art, an action that takes place in a "space of appearance" (pp. 29-35). He does not address the adequacy or relevance of other notions of politics, such as the process by which we make the rules by which we live in common; or determine who gets what, when, and how; or allocate values.

Several rewarding treatments of the political thought of Arendt, among the abundant works, are: George Kateb, Hannah Arendt: Politics, Conscience, Evil, 1983; Margaret Canovan, Hannah Arendt: A Reinterpretation of Her Political Thought, 1992; and Michael Gottsegen, The Political Thought of Hannah Arendt, 1994.

Adam Smith and the Virtues of Enlightenment. By Charles L. Griswold, Jr. Cambridge: Cambridge University Press, 1999. 412p. \$59.95 cloth, \$21.95 paper.

Shannon C. Stimson, University of California, Berkeley

Charles Griswold poses a series of alternatively fruitful and frustrating questions. He begins with an excellent query for consideration by moral and political theorists that he then chooses not to address: "Is there a sense in which [others'] misery is necessarily the price of our happiness" (p. 3)? Instead, it quickly becomes apparent that the motivating question of this study is to be a rather more provocative and self-absorbed one: "Might the apparent devolution of liberty into spontaneity, or pluralism into relativism, of knowledge into technology and thence into the self-vitiating mastery of nature, or science into a 'worldview' produced by a given historical milieu, of culture into vulgarity, of reason into imagination and then into fantasy—in short, the devolution of the Enlightenment into what is widely termed 'postmodernism'-itself be a natural consequence of the very premises of the Enlightenment" (p. 3)?

Griswold contends that our response to this largely unanswerable (if not wholly nebulous) question depends on how we analyze "the virtues and vices of the Enlightenment" (p. 3). In this analysis, he claims to follow Leo Strauss and Alasdair MacInytre in viewing the Enlightenment as a "fundamentally mistaken rejection of ancient and medieval philosophy" (pp. 3-4). He then asks: "How can the older, virtue-centered tradition be made to mesh with modern political, jurisprudential, and economic practice" (p. 4)? This series of interrogatives brings us to one last question, which reveals that the true aim of the book is to resolve all this anget

about the twin Enlightenment/postmodernist threats to ancient virtue. So, Griswold asks, before rejecting the Enlightenment for its inability to return us to the virtue of the ancients (or some simulacrum thereof), might we not first look to see whether there are "overlooked or misunderstood resources for self-criticism and justification in the Enlightenment itself, especially ones that also provide for the preservation of desirable aspects of ancient thought" (p. 7). It is in this search that both the political economy and moral theory of Adam Smith become one such resource—a kind of moral tertium quid.

Griswold begins by treating the Enlightenment as something of a "black box" until he arrives at Smith and recognizes that it is a complex and multiple idea. "Critics of the movement were part and parcel of it from the start, and Smith himself may in some respects be counted among them" (p. 9). At this point, some might say that the motivating question for the study falls away, since out of a "movement" realistically so complex, few, if any, natural or necessary consequences could be shown to follow. Even so, we are left with a number of thought-provoking insights on Smithian "sympathy" and moral imagination. The book is at its best when Griswold turns his considerable powers of textual and philosophical analysis to some of the issues dominating more recent considerations of Smith's work, such as the theory and practice of rhetoric, Smith's use of examples, and particularly the "theatrical" character of the moral and commercial world (p. 66). Here Griswold certainly adds to our understanding of Smith's larger moral as well as economic and political concerns. Notably, he enlarges upon and corrects the view of Smith's "impartial spectator" and its function in his theory of literature and moral education, presented most recently by Martha Nussbaum (Poetic Justice: The Literary Imagination and Public Life, 1995) (pp. 9, 42, 68).

At the same time, one might question the overly optimistic rendering Griswold offers of Smith's own understanding of the implications of an advancing and future commercial society, and the function of the market mechanism. "Smith's moral, political and economic doctrines are geared toward explaining how individuals as well as nations can live together harmoniously in spite of the ever present potential for conflict" (p. 10). "Spontaneous order" was not a concept Smith himself employed, irrespective of his later Hayekian interpreters. A contemporary economist might tend to characterize Smith's inquiry as a harmony theory, but it is equally one in which competition is the central, driving force of development. Smith's caustic references to landlords, who "love to reap where they never sowed" (Wealth of Nations, I.vi), to the need for police to ensure the property owner a decent night's sleep (V.iv), or to the justified demands of laborers for "combinations" in order to resist manufacturers' greed for profits (I.viii), indicate that conflict within his vision of an evolving commercial society was something more than merely potential. Rather, conflict seems woven into the very warp and woof of economic life, however much of the component parts of price, and with it the great orders of society, might be argued to produce an integral whole. Indeed, it was in large part this recognition that led Marx to consider Smith a classical rather than a vulgar political economist.

Certainly, Griswold is right that the combined effort of Smith's moral, political, and market vision "seeks to free us from war and faction" (p. 10), but Smith does not claim—as his modern economistic interpreters would have us believe—that the market can perform this feat for us single-handedly. And Smith does not engage us in dichotomizing the ancient and modern worlds along the axes of consensus and conflict,

as the author seems to suggest (p. 10). Surely, Smith's "view of the world" and our study of his "careful attention to moral sensibility" (p. 10) are lent no more credence by reference to "the catastrophic collapse of moral sensibility and the corresponding butchery in our century" (p. 10) than by reference to the accounts of butchery offered by Thucydides or the moral collapse of the Crusades.

At the same time, it seems strange to argue that the political economist who made famous the term "invisible hand" believed "our destiny is in our entirely visible hands, waiting to be crafted by us" (p. 15). Such a confident reliance on the efficacy of human agency seems to fit poorly with Griswold's own recognition of the place of "moral luck" (p. 16) and the Stoic-inspired "propensity for irony" (p. 16) present in Smith's account of the four stages of history. Yet, if Griswold demonstrates some of the difficulties of attempting to render Smith utterly relevant to our contemporary concerns, he offers for consideration one generous and synthetic account of the relationships among Smith's aesthetic, moral, political, and economic thought.

Messianic Revolution: Radical Religious Politics to the End of the Second Millennium. By David S. Katz and Richard H. Popkin. New York: Hill and Wang, 1998. 303p. \$26.00. Apocalypses: Prophecies, Cults, and Millennial Beliefs through the Ages. By Eugen Weber. Cambridge, MA: Harvard University Press, 1999. 288p. \$24.95.

David Walsh, Catholic University of America

The turn of the millennium has invited a good deal of attention to the topic of millennialism. It is a welcome opportunity for scholarly reflection on an abiding feature of historical experience, despite its curious absence from our own millennial celebrations. The publication of the volumes by Katz and Popkin and Weber have all the earmarks of efforts to take advantage of the contemporary interest in apocalypses and messianic expectations. The price of the cloth editions attests sufficiently to the publishers' faith in the project. In other words, neither book is intended for specialists in the field of apocalyptic studies, but they are none the worse for their general appeal. Indeed, they are in different ways commendable attempts by historians of ideas to address the present moment.

The principal value of both volumes is that they illuminate the deeper sources of millennial speculations that perpetually hover around the margins of mainstream public discourse. As such, they provide invaluable insights into notorious but little understood fringe groups. Much of the focus of Messianic Revolution is on demonstrating the shortcomings of law enforcement efforts to deal with the Branch Davidians at Waco, the Freemen of Montana, and the various militia and survivalist movements that remain a persistent irritant of our otherwise placid prosperity. Katz and Popkin, although they provide a survey that connects the American variants of millennialism to biblical and early modern sources, devote most of their attention to the Protestant world and the United States in particular. Their account is an invaluable survey of the creative streams in which apocalyptic inspiration flowed following the Reformation and which formed such a central ingredient in what Harold Bloom calls the "American religions."

In many ways Katz and Popkin have the broader net within which to capture radical religious movements. In their category of "messianic revolution" one does not expect to encounter the scion of the scientific revolution, Isaac Newton, but there he is, displayed in all his speculative glory and

demonstrating the continuity between science and the calculation of the apocalypse. Equally valuable is the retracing of the complex relationships between the foundation of a Jewish state and the various strands of millennial expectation. An extensive discussion of the theoretical contribution of John Darby (1800–82) to millennial discourse underlines the rarity of development in what is essentially a static expectation. Ironically, the anticipation of the greatest transfiguration in history can only be sustained by an unvarying detachment from actual history. Darby introduced the notion of the "rapture" as a distinct phase in the expectation, one that allows the possibility of individual transfiguration in advance of the final cataclysm.

Weber deals with many of the same characters, but he ranges more broadly over the whole history of apocalyptic expectations. As a result, he provides a context beyond the strictly religious forms of radicalism. Weber is more willing to explore the points of convergence between the secular and religious apocalypses, especially through their conjunction in postmillennial traditions. The latter emphasize the degree to which historical progress is engaged in preparing a state of perfection, after which the advent of the millennial reign of Christ on earth can take place. In contrast, the premillennial enthusiasts emphasize the unregenerate condition of the world, which can only be regarded as incapable of transformation and therefore ripe for a cleansing apocalypse before the reign of Christ becomes possible. Not surprisingly, premillennialists have formed the dominant strand among chiliastic movements. Revulsion at the degenerate state of the present is always a more effective motivation than optimistic hope for incremental improvement. But the postmillennialists are more in tune with the progressivist outlook of modern civilizational history as a whole. Weber certainly draws attention in passing to the connection, but both he and Katz and Popkin fail to take the full measure of the relationship.

Despite the informative, accessible, and well-documented treatments provided by both volumes, they suffer from a theoretical limitation in their conception of apocalypse. In large measure because they take their own starting point in the agnostic perspective of contemporary historiography, they are inevitably held captive to conventional categories of analysis. Apocalyptic speculations are on this conception the preserve of extremist religious movements that operate at the margins of the historical mainstream. The possibility that the same mood might for extensive periods infect the mainstream itself is rarely confronted in its full significance. As a result the forest of apocalyptic longing is missed in fascinating studies of the trees of a particularly luxuriant variety. Politically, this is a serious defect, since it is precisely the apocalyptic appeal that has provided the impetus behind the most powerful movements of the late modern era.

We enjoy an almost unprecedented moment of global peace precisely because of the disappearance of the last political movement of apocalyptic intensity. Communism endured for almost a century because it could draw on the counterfactual faith of all apocalypticists. No amount of evidence to the contrary can dislodge the expectation of a transfiguration that bases its claim entirely on the future and not at all on the present. The other most destructive political movement of our era was equally rooted in the representation of a self-styled apocalypse. Nazism took over the classic Joachimite claim of a third age, a third Rome, a third Reich. A widespread style of extremist politics received definitive expression in the purest revolutionary faith of all, that of anarchism. Since a transforming apocalypse was the necessary phase by which the end of history would be reached, it was pointless to speculate on the character or content of that

new age from the unregenerate present. All that could be said was that it would be radically other than the condition we know, and it could be hastened only through the work of universal destruction. As a tactic this inspiration became internalized in the phenomenon of terrorism. The whiff of apocalyptic rhetoric even finds its way into the musings of liberal statesmen, as in FDR's famous "Four Freedoms" speech.

This is surely a significant material oversight. It is not as if the connections between the totalitarian, the revolutionary, and the religious forms of apocalypse have gone unnoticed. Weber even refers to the connection between nineteenth-century socialists and their Christian counterparts, but he does not contemplate the apocalyptic appeal of the revolutionary movements as such. There is no mention of the classic study by James Billington, Fire in the Minds of Men: Origins of the Revolutionary Fath (1980), or of the extensive literature on political messianism throughout the modern era. So long as one sticks with the assumption that apocalyptic longings are the preserve of marginal sectarian cults on the religious Right or Left, one is bound to overlook the extent to which the same appeal is operative in virtually all forms of radical and revolutionary politics.

The defect is essentially methodological, although it leads to empirical narrowness. Perhaps the source of limitation lies in the all too confident assumption that we could never be taken in by such eschatological fantasies. Despite the evident open-mindedness of the authors, they display a distinct lack of interest in probing the sources of the apocalyptic experience itself. Why would anyone place reliance in such visions of an all-transfiguring end of the world? Where do they come from, and what finally explains their growth and decline? The kind of depth analysis of the experiences and symbols of the transfiguration available in the work of Eric Voegelin, for example, is entirely neglected. Without reaching some clarity on the inner structure of apocalypse as a mode of existence, it is inevitable that scholarship will remain captive to the prevailing prejudices. Even given this serious limitation, however, both volumes provide a compelling and informative account of the rich diversity of millenarian and messianic expectations that swirl around the mainstream of religious and secular consciousness.

Principles of Social Justice. By David Miller. Cambridge, MA: Harvard University Press, 1999. 337p. \$45.00.

Matt Matravers, University of York

Miller's aim in this clear and well-written book is to defend a plural theory of justice that consists of three component principles: desert, need, and equality. Rather than try to combine our beliefs about justice with highly abstract principles, Miller thinks we should "begin by trying to discover the practical principles that guide those beliefs" (p. 24). Michael Walzer (Spheres of Justice, 1983), with whom Miller has much in common, claims to find such principles in the meanings of social goods, but Miller prefers a different strategy. Rather than unpack the meanings of goods, he looks to the various ways in which human beings interact, to what he calls "modes of human relationship" (p. 25). In brief, the author argues that a principle of justice as need is associated with the mode of "solidaristic community," desert is similarly relevant to "instrumental association," and equality to "citizenship" (p. 26).

Miller's claim is that these modes of relationship "call forth" their associated principles of justice (p. 32). More precisely, a particular principle of justice will require a

particular relationship to be feasible. Moreover, the mode of relationship makes some associated principle appropriate; they fit together. As the defense of the fit between certain types of relationship and principles of justice cannot be asserted as a matter of logic or conceptual clarity, Miller invokes evidence of meaning and usage as well as a style of justification associated with ordinary language philosophy. Thus, he looks to social science to tell us how people think about justice and how they use the term.

The conclusions are presented in chapter 4. First, our ordinary use of justice is pluralistic and complex. Second, there is some support for the connection made above between certain types of interaction and certain governing principles of distribution. Third, desert in some primitive, preinstitutional sense plays an important role in people's thinking about justice. Fourth, need is also important, but people give short shrift to what they consider mere wants and preferences as against genuine claims of need. Fifth, what people think about equality is hard to determine, but it is clear that they think the current inequalities in income and wealth in contemporary liberal democracies (notably the United Kingdom and the United States) are far too great.

Much of Miller's book is a working out and defense of these positions, most notably the third: that a theory of justice must give a prominent place to a principle of preinstitutional desert. Miller's contextualized concepts of need and equality may raise a few eyebrows, but it is the centrality of desert that makes his theory distinctive. Having considered and dismissed MacIntyre's account of desert, Miller proceeds to his own. A desert judgment is a claim that it is fitting or appropriate for an agent to have some benefit on the basis of some voluntary and intended performance. Of course, such an account can be understood in an institutional (or entitlement) sense. Given the way races are run, the person who first crosses the line deserves—is entitled to—the gold medal. But Miller wishes to resuscitate a more basic preinstitutional sense of desert, one that can be used critically to assess institutions. Good institutions are those in which, ceteris paribus, those who deserve something get it. Many philosophers find this idea quite mysterious, but Miller insists that those less troubled by abstract thought have no such qualms.

Yet, restoring the central place of desert—at least in instrumental associations—requires that a number of questions be considered. Even ordinary language, and people, discriminate between what is done voluntarily and intentionally and what is owing to bad luck or is otherwise beyond the agent's responsibility. As noted above, people distinguish between genuine needs and mere preferences. Here, the technique of looking to ordinary usage is not much help. These are difficult questions, and people's beliefs (including, of course, the beliefs of many philosophers) are inconsistent. Once these problems have been overcome, the primitive notion of desert needs to be unpacked. What is the measure of "meritoriousness" to be? What makes some response fitting or appropriate, and how do we know it to be so?

The major drawback of Miller's book lies in the failure to address adequately the first set of questions. The theory requires an account of responsibility and a much more compelling discussion of luck. What makes this lacuna extraordinary is that so much contemporary literature (in the "equality of what?" debate and beyond) revolves around these questions.

The same problem does not arise for the second set of questions, which get full consideration in chapter 9 (a revised version of Miller's "Two Cheers for Meritocracy," Journal of Political Philosophy 4 [1996]: 277-301). The relevant measure of merit, given that what is at stake is the principle of social

justice associated with instrumental associations, is productive contribution as an indicator of "social value," and it is to be measured by the value that it would attract in a wellregulated market. Miller's defense of market valuations is careful and sophisticated, but it is (as he admits) a defense of the market as a measure of "economic contribution" (p. 185, emphasis in original). Even if this is accepted, what is not clear is why economic contribution is the relevant measure of merit, even in that part of society best characterized as an "instrumental association." Miller relies on there being discrete modes of association with their own "mode[s] of recompense" (p. 200), but he has no argument in defense of this (any such argument would have attached to it the danger of slipping back into a Walzer-like focus on goods). In short, the problem is revealed in Miller's use, seemingly interchangeably, of "merit," "social contribution," "social value," and "economic contribution." Not only is the market a poor measure of most of these, but also we need to know, and have defended, what is relevant to the principle of desert and what response is fitting to each.

In focusing on desert, I have taken what I think to be most distinctive about Miller's book. The working out of the principles of need and of equality is done well and advances the cause of those who think principles of justice plural and their content deeply contextual. It is in the nature of such approaches that more questions are raised than resolved concerning the relationship of the principles in real situations in which modes of association are not clearly distinguishable.

Is Multiculturalism Bad for Women? Edited by Susan Moller Okin. Princeton, NJ: Princeton University Press, 1999. 146p. \$29.95 cloth, \$12.95 paper.

Susan Bickford, University of North Carolina at Chapel Hill

Many students in required cultural diversity courses enter (or leave) with what Uma Narayan (Dislocating Cultures, 1997) has called "the anthropological perspective"—the idea that those in the Western world should be interested in and knowledgeable about other cultures but avoid any moral criticism of them. This refusal to judge is a healthy corrective to racist or imperialist assumptions about better and worse cultural traditions, but it is morally problematic. In this book, Susan Moller Okin insists that we judge, and that we judge according to the effect of a cultural practice on women.

This slim volume with the provocative title is composed of a short essay by Okin, no less than 15 responses to it, and Okin's concluding reply to her interlocutors. The book addresses a specific manifestation of "multiculturalism": the claims made for special group rights of minority cultures in liberal societies. Okin's primary point is that, in the vast majority of cases (language rights are the obvious exception), protecting the minority culture's right to certain practices means refusing to protect women in that culture. The list of practices includes clitoridectomy, child marriage, coerced marriage, polygamy, asymmetrical divorce laws and property laws, responses to rape, veiling, and murder. In particular, Okin cites recent legal cases in which minority males relied on "the cultural defense" to explain criminal violence against "their" women—such as "kidnap and rape by Hmong men who claim that their actions are part of their cultural practice of zij poj naim, or marriage by capture, and wife-murder by immigrants from Asian and Middle Eastern countries whose wives have either committed adultery or treated their husbands in a servile way" (p. 18).

The liberal defense of minority group rights (most cogently articulated by Will Kymlicka, a respondent in this volume) is

that these cultures should be protected in liberal societies because a culture is necessary to provide individuals with both a sense of self and the capacity to live a chosen life. Okin contends that if these theorists would consciously attend to the private sphere, to familial and sexual arrangements, they would recognize that many practices of minority cultures undermine this possibility for women; in fact, "most cultures have as one of their principal aims the *control* of women by men" (p. 13, emphasis added).

Okin charges that liberal proponents of group rights for minority cultures ignore a crucial point: These are not monolithic or homogeneous groups. They are, rather, characterized by internal difference, and a primary axis of difference is gender. Because most cultures are not sexually egalitarian, this gender difference is in fact gender hierarchy. This in turn affects what we "know" about a culture's practices and beliefs—"the more powerful, male members are those who are generally in a position to determine and articulate the group's beliefs, practices, and interests" (p. 12). Yael Tamir makes a strong supporting argument that, as a consequence, "group rights strengthen dominant subgroups within each culture and privilege conservative interpretations of culture over reformative and innovative ones" (p. 47).

Okin is certainly vulnerable to the charge that she makes very broad claims and blurs together a variety of diverse practices. Some respondents (Nussbaum, al-Hibri) react to her claims about the patriarchal nature of the world's major religions precisely by noting the existence of "reformative" feminist interpretations of these religions. Others question Okin's implication that there is a simple opposition between men's and women's perspectives by pointing out empowering interpretations by women of such practices as veiling and polygamy (Honig, Parekh, Bhabha). Taken together, these responses provide a more subtle specification of the question at hand. If we take seriously Tamir's and Okin's point that the interpretation of "dominant subgroups" should not be the privileged account, what interpretation should be? In other words, whose representation of a culture and its practices is to be taken as authoritative? Both supporters and critics of Okin imply that it is women's perspectives that must be taken seriously. Yet, these writers also make clear that the contestation within a culture about its gendered "traditions" and practices includes contestation among and between women. How to deal with this—how it should matter for the judgment of minority group rights in liberal societies—is a crucial subtext of this volume that is not fully confronted. Does it undermine Okin's case that many women in the relevant cultures support and in fact perform clitoridectomy? Does it undermine her interlocutors' case that many women do not?

It makes sense that one would look to "what women say" in particular cultures about judging gendered cultural practices. It makes sense because learning how a practice functions or what it signifies means looking at what practitioners say about what it means to them. Okin's respondents have aided in showing how much hard work is necessary in order to know something about a culture, and how much that work requires conscientious dialogue within and between cultures. As trite as it may sound, this may be at least a process of judging that is compatible with multicultural respect. But "what women say" can never be a final easy ground for judgment, because women say different things. We cannot dismiss this difference by attributing false consciousness to women who support what seem to us oppressive practices. But neither are we bound to treat all perspectives as beyond criticism as Okin says in her reply, "one need not rely on the Marxist theory of false consciousness to recognize that persons subjected to unjust conditions often adapt their

preferences so as to conceal the injustice of their situations from themselves" (p. 126).

In such a situation, what should guide judgment? Are there principles by which these judgments should be made, and are such principles flexible enough to attend to context and variation? Sunstein and Nussbaum begin to address this issue in terms of judicial principles; Okin relies on liberal principles of human dignity and equally freely chosen lives. But, as various interlocutors point out, Western liberal societies themselves are not models of gender equality, and their practices deserve critical attention, too, a point with which Okin is in fervent agreement. Such critical attention can serve to remind us (as Parekh does) that there are conflicting interpretations of Western liberal principles.

My complaint about this volume is the format (undoubtedly a residual effect of original publication in the Boston Review). Because of the number and length of responses, each author makes only a series of abbreviated points, without fleshing out the arguments or going deeply into particular examples. (To be frank, some of the responses do not add up to much.) This is one concern I have about using the book as a teaching text; it is not a very good model of argument or of what it means to "know" something about other cultures. Despite that concern, I can imagine the volume being useful in courses on democratic theory, liberalism, feminist theory, or ethnic politics. I would suggest using selections from this book in conjunction with an essay that more closely examines a particular example of "the politics of traditional formation" (e.g., a chapter from the Narayan book cited above).

As Katha Pollitt asks in her contribution (p. 28): "What is a culture, and how do you know?" This book keeps that question before our eyes, and thus makes it impossible for us to avoid critical moral engagement with issues of multiculturalism.

The American Language of Rights. By Richard A. Primus. Cambridge and New York: Cambridge University Press, 1999. 262p. \$54.95.

Howard Gillman, University of Southern California

The postphilosophical, pragmatist point of departure for this wonderful first book from Richard A. Primus is that we should talk less about the abstract or ontological properties of rights (which, frankly speaking, do not exist) and more about the political dynamics of rights discourse as a distinctive social practice.

Primus begins with a critique of scholars who are preoccupied with elaborating formal definitions of rights and with policing the boundaries of the category "rights." Instead, scholars should think of rights as a kind of Wittgensteinian "language-game," in which the meaning (and reality) of the concept is induced from usage rather than deduced from proffered analytic categories. Such an approach makes room for the ways in which conceptions of rights have changed over time and for the fact that different users adopt diverse (and potentially contradictory) understandings of the concept. It also means that scholars interested in examining rights as they exist in practice "should seek to encompass as many instances of seeming rights discussion as can be accommodated before coherence breaks down" (p. 33), rather than limit inquiry to the technical boundaries set out in many formal treatments. He does not share (for example) Hohfeld's concern with distinguishing assertions of privileges from assertions of rights, since Primus properly notes that these philosophical preoccupations do not do justice to the

various ways in which the concept is used by actual historical agents.

What does fall within the language of rights? Primus argues that in the American case "people use rights claims (1) to claim general authority for specific propositions, (2) to attempt to entrench politically precarious practices, and (3) to declare particular practices or propositions to be of special importance" (p. 39). In a separate chapter on the development of rights in American history, Primus suggests that three elements have shaped transformations or developments in the social practice of rights discourse. First, a condition of "adversity" persuades people that prevailing political arrangements are unacceptable. Second, a "reaction" takes place in which people draw from a previously existing culture of rights to articulate a new rights agenda that is designed to correct the adverse conditions. Third, a "synthesis" occurs that attempts to reconcile the most recent layer of rights claims with previous traditions. Primus's effort to generalize about stages of development brings to mind the work of historically minded constitutional theorists, such as Akhil Amar and Bruce Ackerman. Primus distinguishes his contribution, however, by criticizing Amar for ignoring twentieth-century developments in rights discourse and Ackerman for paying too little attention to the American reaction to Nazism and totalitarianism after World War II.

Primus fleshes out his claims about adversity, reaction, and synthesis in three empirical chapters. The first focuses on the founding period and emphasizes how the use of rights discourses violated many of the tenets of modern analytic rights theory. For example, that generation "believed individuals, institutions, and communities all to have the capacity for possessing rights," and it "felt that rights came from many different sources, human, natural, and divine" (pp. 88-9). What tied together these diverse arguments was a shared interest in mitigating the specific adversities suffered as a result of colonial practices (relating mostly to armies, trials, religion, and trade) and entrenching new policies designed to prevent reoccurrence. Similarly, in the chapter on Reconstruction, Primus interprets postwar developments not as an effort to cleanse a set of underlying founding principles but as a reaction by northern whites to specific threats associated with the antebellum politics of "slave power." Primus also shows that as Reconstruction progressed, whites created and manipulated distinctions, such as "civil v. political v. social rights," in order to privilege the policies they cared most about while simultaneously rejecting broader claims premised on a more thoroughgoing egalitarian vision.

In the third empirical chapter, Primus emphasizes the ways in which the American experience with Nazism and totalitarianism facilitated another reconfiguration. Unlike the social welfare agenda articulated in FDR's "second bill of rights" (which never gained a foothold in constitutional law), the leading themes of the antitotalitarian experience "included personal privacy, police procedures, free expression, and protection against discrimination" (p. 181). It also included a new language of "universal human rights," which was both substantively different and more inclusive than the founders' notion of natural rights. These themes became central (albeit contested) features of the Supreme Court's jurisprudence in the decades after World War II and laid the groundwork for the kind of nonpositivist privacy jurisprudence that emerged in the 1960s. They were also constitutive of most modern academic theorizing about rights, most notably Ronald Dworkin's conception, which Primus respects more as a stylized articulation of a historically contingent political agenda than as an abstract philosophical statement.

The scope of this work makes it inevitable that Primus will

stake out some positions that will be considered insufficiently justified. He claims that his conception of rights is not simple nominalism because an assertion of a right is only properly considered a right if it "obeys the rules of the governing practice" (p. 238). Yet, he also knows that on his account the 'practice" is not "governed" by "rules" as such, and when he attempts to referee the practice with reference to his "entitlements-liberties-powers-immunities rule" and his "important-and-should-be-protected rule" (p. 238) he hovers a bit too close to the analytic tradition he is quick to criticize. It might have been more consistent to keep the focus on the prevailing assumptions within the relevant interpretive communities. Moreover, Primus's reasonable decision to take rights claims at face value (more or less) results in a discussion that runs together assertions that appear purely cynical and manipulative (such as the "shell game" of Reconstruction rights for blacks) and those that appear to be relatively autonomous from conventional partisan agendas (such as the enhanced commitment to privacy in the shadow of totalitarianism). If rights discourse is to be respected as a distinctive and important social practice, it may be necessary to distinguish its purely instrumental deployment from more sincere or principled uses, even though such an effort would seriously complicate the hermeneutical methods at the heart of this project.

Finally, some may complain that Primus's periodization inevitably leads to a review of only a narrow array of rights discourses—namely, elite claims on issues of great importance during political crises—and (in Ackermanian fashion) to focus too much on large-scale change rather than everyday, uneven evolution in different corners of the language game. But Primus understands these limits, and he is correct to respond that "showing a new way to read well-known sources might do more to make us rethink our understanding of rights discourse than a reading of less-familiar sources would" (p. 74). For those interested in the theory and practice of rights in the American tradition—whether in political philosophy, constitutional law, elite politics, or social movements-Primus successfully opens some important new theoretical debates as well as some promising new lines of empirical inquiry. The result is a thoughtful, well-researched, and provocative contribution to our understanding of liberalism, constitutional theory, and American political development, and it is highly recommended.

Carl Schmitt: The End of Law. By William E. Scheuerman. Lanham, MD: Roman & Littlefield, 1999. 360p. \$70.00 cloth, \$22.95 paper.

Ellen Kennedy, University of Pennsylvania

When Carl Schmitt died in April 1985, only The Concept of the Political was available in English, and few in America or Britain knew his work. Since then, a significant body of scholarship on Schmitt has appeared in this country, and numerous texts by him are available in English. But why we should read Schmitt and how we should read him remain in dispute. William E. Scheuerman tries to answer both questions. The introduction provides a brief overview of Schmitt's life and work and wastes no time in getting to the reason he is and will remain controversial. "Too many scholars continue to miss the central place of Schmitt's ideas about law in his intellectual agenda" (p. 2), and it was those ideas about law that led Schmitt into collaboration with Hitler. Since Schmitt's critique of liberal jurisprudence is not limited to Weimar, demonstrating what is so dangerous about it is more than an archaeological project.

Carl Schmitt: The End of Law is two books in one. Part 1 is provocatively titled "The Jurisprudence of Lawlessness." Schmitt's ideas are unwittingly being continued by political scientists and critics of liberal legal theory. Together they represent "the subterranean influence on postwar American political thought" of this most un-American of all thinkers, whose ghost, like the Marxian specter of 1848, "haunts political and legal debates not just in Europe, but also in the contemporary United States" (p. 1). "Mainstream" modern legal thought is liberal. It requires that legal norms be (1) general in character, (2) relatively clear, (3) public, (4) proscriptive, and (5) stable. This theory of the rule of law, Scheuerman argues, "renders state action predictable and makes an indispensable contribution toward individual freedom." It is the foundation of constitutional government that binds officials to the law and minimizes "the potentially undesirable exercise of discretion." A look at regimes where these are not established, he contends, shows "the strength of the liberal argument" (pp. 4-5).

Yet, Scheuerman acknowledges, there are troubling signs that contemporary practices-"necessary forms of state intervention in the capitalist economy" and "the proliferation of powerful constitutional courts" (p. 5)—are undermining the rule of law. The first creates a powerful state active in areas regarded by liberal political theory as outside its sphere. The second may not appear inconsistent with the rule of law, but it "probably requires that constitutional courts engage in relatively limited forms of judicial review," which "for better or worse" they have not always done. These developments signal the very problem liberal theories were intended to prevent: the problem of legal indeterminacy. Scheuerman's account of this is necessarily brief, and it is not really his target. Rather, this book is about the responses to legal indeterminacy, all of which he seems to think are more or less inconsistent with the idea of the rule of law. H.L.A. Hart represents "limiting indeterminacy," Richard Posner and the Realists stand for "indeterminacy," and CLS (Critical Legal Studies) lawyers such as Duncan Kennedy are "racial indeterminants." Although forceful about the dangers of such positions, Scheuerman offers an inconsistent account of how Schmitt fits into these debates.

The strongest claim would be that Schmitt's work influenced American legal scholars, political scientists, and intellectuals (such as Stanley Fish, whom Scheuerman calls a "nihilist," p. 37). Part 2, "Carl Schmitt in America," might be described as "outing" some very high-profile figures in political science and economics as closet "Schmittians." Unlike the legal theorists discussed in Part 1, the men discussed in Part 2 knew Schmitt personally and were influenced by his work. These chapters have otherwise little interconnection. They try to do for Joseph Schumpeter, Friedrich Hayek, and Hans Morganthau what Heinrich Meier did for Leo Strauss (Carl Schmitt and Leo Strauss: The Hidden Dialogue, 1995). Meier's analysis of the intellectual relationship between Strauss and Schmitt was a tour de force of interpretative history. Scheuerman's discussion in Part 2 is something less.

Will empirical political scientists working on democracy and electoral politics be surprised to find themselves aligned with Schmitt via Schumpeter? Perhaps, but Carole Pateman made the point about the elitist bias of American political science in *Participation and Democratic Theory* (1970). Unlike her, Scheuerman seems to regard this as an object less to be explained than merely condemned. "In what surely belongs among the great intellectual paradoxes of our time," he writes, "many American political scientists, in the immediate aftermath of the victory over National Socialism in 1945, embraced a tradition of political thought that was complicit

in the antidemocratic sins of twentieth century European political theory and practice" (p. 207). "The unholy alliance of Carl Schmitt and Friedrich Hayek" (chap. 8) links "authoritarianism and capitalism" through Schmitt's position on private property in a minor text entitled Equality before the Law (1926) and Hayek's The Road to Serfdom (1944). This explains "the elective affinity between free-market economics and authoritarian politics that has become so common in the contemporary political universe" (p. 224). Most of what the author says about Hans Morgenthau's relationship to Schmitt comes from Morganthau's An Intellectual Autobiography (1978), but Scheuerman does offer an interesting account of how assumptions about "the autonomy of the political," or "pure politics," work within the arguments of the two men. None of these chapters pursues the questions of intellectual traditions or influence effectively and probably should have been published elsewhere, either as separate articles or another book with a broader theme. Their final effect is defamatory and suggests more than it proves. Schumpeter's theory, Scheuerman writes, "is hardly fascistic. Yet Schumpeter may be only a few steps away from Schmitt's path" (p.

Similar rhetorical turns characterize the first part of Carl Schmitt: The End of Law, which distract the reader from some of the most interesting aspects of Scheuerman's analysis. He is right to see legal indeterminacy as central to Schmitt's political thought, and he traces it through Schmitt's major works on political institutions. The argument is persuasive and important that Schmitt was the first to recognize the importance of legal indeterminacy, not just for the logic of law but for a political science of the state. In two early works (Law and Judgement: An Examination of the Problem of Legal Practice, 1912, and The Value of the State and the Significance of the Individual, 1914), Scheuerman writes, Schmitt "struggles to overcome the antinomy of law and power" (p. 25). Unlike the young Hans Kelsen, who separated these domains conceptually, Schmitt focused on the links between them. In these works, as in those of the Weimar period and later, the originality of Schmitt's approach often reshaped the stock questions of continental jurisprudence. The topic of what is "right law," the subject of so many jurisprudential tomes, was conceived in purely formal terms by the nineteenth-century lawyers. Schmitt restates that as "how do we know when a judge's decision is right?" and modernizes it by applying Weber's notion of the ideal-type. We know that a judge's decision is right when another judge would have made the same decision, if, as Schmitt explains, "another judge is the empirical type of the expertly trained jurist" (Law and Judgement, quoted on p. 23). At stake is the traditional liberal assumption that, as for the rule of law not men, there must be a single determinate answer to any legal question. Otherwise, the rule of law would be replaced by its opposite, will and discretion.

The chapters that follow link the major themes of Schmitt's work to recent debates in political science. In chapter 2, "The Decay of Parliamentarism," for example, Scheuerman makes the connection between the current discussion of civil society and Schmitt's powerful analysis in *The Crisis of Parliamentary Democracy* (1923) and *Constitutional Theory* (1928) of how special interests working through political parties transform the theory and practice of representative government. "The Critique of Liberal Constitutionalism" (chap. 3) reads Schmitt in the context of problems fashionable among post-modern political theorists, such as Jacques Derrida, and legal scholars like Robert Clover: How should "normative" constitutional theories be understood in light of the "violent willfulness" that usually generates them? "The original sin of

foundational violence means that the constitutionalist dream of 'government of law, not men' always suffers from a fundamental hypocrisy, it obscures the arbitrariness that haunts even 'normal' political experience" (p. 82). Like Schmitt, Derrida et al. are drawn to "limit situations," an approach Scheuerman seems to think must lead to fascism.

approach Scheuerman seems to think must lead to fascism. In the "governability" debate of the mid-1970s (Michael Crozier, Samuel P. Huntington, and Joji Watanuki, The Crisis of Democracy: Report on the Governability of Democracies to the Trilateral Commission, 1975), Scheuerman hears the echo of Schmitt's analysis of the destructive effects of pluralism and polyarchy during Weimar's final presidentialist phase, from 1930 to Hitler's appointment in January 1933. The Defender of the Constitution (1931) was the Schmitt work most admired by Neumann and Kirchheimer because of its brilliant analysis of "adversarial pluralism" and the erosion of parliamentary politics through the dependence of political parties on what we call "soft money" today.

But readers unfamiliar with those German debates will be misled by Scheuerman's less than careful distinction between what Schmitt (and others in the early 1930s) meant by "the total state," as distinct from "the totalitarian state" under National Socialism. The total state referred to a system we all more or less accept today, one in which governments take responsibility for steering the economy toward prosperity and provide a security net when that fails. In the process, governments intrude into sectors that classical liberalism regarded as "private." Whether this is desirable or not, it is not a liberal theory of government, and Schmitt consistently stressed the consequences of such developments on law and the state.

To demonstrate the centrality of Schmitt's political theory to the questions of government in the twentieth century, as Scheuerman does, is a significant achievement. Yet, this is an oddly unsure book. Schmitt's work is important and should be read—but its conclusions are "shocking" (p. 84). Schmitt "tackles the hard questions often ignored by contemporary radical jurists" (p. 134), and he "would have agreed with the basic outlines of (Dworkin's) diagnosis" of legal indeterminacy, but his answers led to Nazi terror (p. 139). When Scheuerman asserts that "Schmitt speaks to important questions within liberal theory" but "lacks the conceptual instru-ments for analyzing these questions adequately" (p. 74), the confusion is complete. Its source lies in a fault Scheuerman rightly discovers in Schmitt's critique of Hans Kelsen: the backward reading of a text to reveal a telos (p. 78). Just as Schmitt sees Kelsen's liberalism as implicit in all previous versions, so, too, Scheuerman reads the worst of Schmitt's arguments (in such notorious texts as "The Führer Defends the Law," Deutsche Juristenzeitung 39 [1934]: 945-50) as implicit throughout. This also explains the frequently maudlin outbursts in this book, in which the impulse to warn seems to overtake the work at hand. If fascism and its horrors were always implied, then the reading of Schmitt must be taken as a kind of vaccine against repeating the errors and horrors of the century just gone.

Why should we read Carl Schmitt? How should we read him? This book answers neither question.

Modesty and Arrogance in Judgment: Hannah Arendt's Eichmann in Jerusalem. By Barry Sharpe. Westport, CT: Praeger, 1999. 192p. \$55.00.

Lawrence J. Biskowski, Northwestern University School of Law

The unique qualities of the human faculty for judgment must be recognized in any explanation of political phenomena that seeks to stay true to the phenomenology of actual lived experience of political decision making and action. Judgment is, moreover, implicit in the various vocabularies by which we assign praise and opprobrium to political actions and agents. Morality and ethics—even the very notion of personal responsibility—verge toward meaninglessness without at least the tacit supposition of a widely shared ability to judge right from wrong. Attributions of beauty, quality, and greatness are merely emotive expressions without a presumed ability to judge that is both based on community standards and somehow able to transcend them.

Judgment is thus central to the ways we speak and act every day. Yet, judgment is one of those ineffable human capacities that routinely frustrate our attempts to grasp them through theoretical analysis or empirical observation. As a result, political judgment is not written about very much, at least not directly. It is much easier to avoid wooly arguments by reducing judgment to a matter of choosing the means most likely to satisfy some constellation of desires, preferences, or interests. These desires, preferences, and interests are then treated as prior to rational decision making and choice, as if they were not also the products of various decisions and choices. Judgment becomes simply a matter of rule-following, the correct application of a general principle (e.g., utility maximization) to a particular case. But judgment qua subsumption of particular case to general rule always begs the question of which rule to follow (e.g., is it really appropriate for me to be thinking of maximizing my utility in thus situation), especially in situations in which agents find themselves faced with decisions involving multiple competing interests and obligations and also when there simply does not seem to be a general rule applicable to the particular facts at hand. Such general rules turn out to be like Wittgenstein's famous signs: At best, they provide some idea of what can be expected in a certain direction; they are not able to tell us which way we ought to go. The latter is literally a matter of judgment.

The most serious theoretical considerations of the human capacity for judgment are found in Aristotle and in the German philosophical tradition. For contemporary political theorists, the leading inspiration has tended to be the controversial and unfinished work of Hannah Arendt. Two substantial books (Ronald Beiner, Political Judgment, 1983; Peter Steinberger, The Concept of Political Judgment, 1993) and a host of articles have sought to build on the foundations laid by her, but it seems fair to say that after Arendt our progress in understanding judgment has been mixed and sporadic. When a new theoretical analysis of political judgment comes out, however, hope seems to spring eternal. When the analysis is based on a shrewd and novel insight, as is Barry Sharpe's Modesty and Arrogance in Judgment, there is all the more reason to expect an advance in our understanding of this clusive, baffling, and utterly fundamental capacity.

Sharpe's strategy is to interrogate and explicate Arendt's apparent theory of political judgment by means of the judgments Arendt made herself in reporting on the trial of Adolf Eichmann, the SS officer who supervised the logistics of the Holocaust. Eichmann's insistence that he was not qualified to pass judgment on the orders and purposes of the Nazi leadership illustrates what might be called excessive modesty in judgment. Eichmann's "Who was I to judge?" is an implicit claim that he did not make a moral choice to participate in the Final Solution and bore no responsibility for the consequences of his actions. No doubt Eichmann did feel this modesty—although new light may be shed on this issue by the recent release of Eichmann's copious apologia pro vita sua, written while incarcerated in Israel-and most people can feel at least some empathy for the difficulty of his position. But this modesty, if allowed to stand as an excuse for not judging, leads directly to the complete breakdown of the notion of personal responsibility for one's actions and of the moral and legal systems based on this notion.

But if Eichmann must be held accountable for judgments he made (or neglected to make) in a difficult situation, consistency and fairness prompted Arendt (never overly modest herself) to require that others also be held accountable for their choices in situations even more difficult. For this reason she pointed an accusatory finger at the Judenrate, the Jewish leadership councils that cooperated with the Nazis by compiling lists of people, addresses, and property, by administering the ghettos, and even by helping decide who would die and when. Arendt's presumption to judge the Jewish leadership caused perhaps even more controversy than her description of the banality of evil exemplified by Eichmann. This presumption to be able to judge others acting in situations that one never directly experienced oneself typifies and crystallizes what Sharpe calls the inherent "arrogance" of judgment.

These concepts of modesty and arrogance in judgment provide the structure for what Sharpe says (pp. xiv-xv) will be an analysis of ways in which distance—in space, time, and imagination—serves to facilitate and obstruct individual judgment. But what could have been a very interesting and

enlightening analysis never quite comes to fruition. Earlier treatments of judgment are far more subtle, nuanced, and sustained, and one can learn a great deal more about judgment by reading Arendt directly than one can glean from most of Sharpe's commentary. Readers umfamiliar with Arendt will find in this commentary an admirable and useful introduction to the powerful argument she makes in Eichmann in Jerusalem and to the controversy still surrounding this argument. Sharpe also demonstrates some of the linkages between the Eichmann arguments and other important aspects of Arendt's work, including the analyses of totalitarianism and political judgment. He updates and clarifies some of Arendt's ideas in view of more recent scholarship on the Nazis and the Holocaust. He has some very interesting and important things to say about the role and responsibility of the Judenrate. Given the nature of the subject matter, Sharpe's writing is generally quite lucid, although a number of gaffes should have been caught by a careful editor. But there is little in the analysis of political judgment that adds to what Beiner, Steinberger, Benhabib, and a few others have already said. In short, this book does not quite measure up to the lofty goals it sets for itself but certainly may be useful for other purposes.

American Politics

Reconstructing Reconstruction: The Supreme Court and the Production of Historical Truth. By Pamela Brandwein. Durham and London: Duke University Press, 1999. 272p. \$49.95 cloth, \$17.95 paper.

Robert W. Langran, Villanova University

Because this book is an outgrowth of a doctoral dissertation, it should have extensive documentation in the form of endnotes, a bibliography that is inclusive and up-to-date, and a thesis that is pursued throughout, all of which it has. The thesis is that a particular perspective on Reconstruction was adopted by the Supreme Court, a perspective that then took on a life of its own as the prevailing view in constitutional law debates. The author combines an historical approach with theory, which is appropriate in that she is attempting to develop a sociology of constitutional law. Of course, for readers who prefer facts, the many pages devoted to theory can become tedious. In addition, Brandwein is a sociologist, not a political scientist, so much of her material is presented from a perspective not very familiar to many in the constitutional law field. Those who have read widely in sociological jurisprudence, however, will find most of what she writes quite readable, because thankfully the book is not loaded with jargon from sociology.

The introduction is very extensive, more so than in most books, but useful in setting up the theoretical framework. Brandwein devotes a good first portion of the book to contrasting the view of slavery of northern Democrats in the Reconstruction Congress with the Republican view. The Northern Democrats opted for popular sovereignty. Once slavery was abolished by the Thirteenth Amendment, they considered the rebellion finished, as that was what the Civil War was all about. Local majorities were then free to control individual rights, the only exception being that formal slave law could not be instituted. Brandwein asserts, however, that the northern Democrats had "a strong strain of white supremacy" (p. 41). Republicans, in contrast, felt that slavery

was still a problem even after the surrender, due to the southern Black Codes, which is why they pushed for the Fourteenth Amendment.

A main theme of the book is how the Supreme Court, in the Slaughter-House cases, adopted the northern Democratic view. Justice Samuel Miller, in a five-four decision, held that the bulk of our privileges come from our state citizenship, not our U.S. citizenship; since the Fourteenth Amendment protects the latter, it is inapplicable in the case (concerning a monopoly and the right to work). "Miller suppressed views of the dangers of slavery that were formed by Republicans in the decades before secession" (p. 65). Despite the dissenters' arguments, the majority version prevailed over the years, weighing "state jurisdiction more heavily than the democratic participation of black citizens" (p. 81). The Court's subsequent decisions made Miller's view of the Fourteenth Amendment "definitive" (p. 94).

The author examines in depth the debate between Charles Fairman and William Crosskey concerning the original understanding of the Fourteenth Amendment. The debate arose when Justice Hugo Black wrote a dissent in a 1947 case, Adamson v. California, arguing that the Fourteenth Amendment incorporated the Bill of Rights against the states. Fairman disputed that point, which Crosskey then defended. Fairman disputed Crosskey, and the battle was joined. Most critics supported Fairman, and "what lawyers and judges received in Fairman's account was . . . an affirmation of state control over citizenship rights and a stabilization of the doctrine of stare decisis regarding Fourteenth Amendment history" (p. 134). This version has become so institutionalized that any attempts to deviate from it run into trouble, even though most of the Bill of Rights has eventually been incorporated.

To illustrate the last point, the author looks at the Warren court debates over legislative apportionment, as exemplified in Baker, Wesberry, and Reynolds, and she concludes that the majority "justices attempted to develop nationalist solutions to citizenship dilemmas without challenging the institutional account of Reconstruction" (p. 184). Many in the legal

community were unpersuaded by those arguments. The author contends that "understanding how stores of symbolic power are accumulated, maintained, and lost is one of the basic objectives of a sociology of constitutional law" (p. 207).

In sum, Brandwein does a good job of showing that an understanding of how the ideas of majorities in passing legislation can be subordinated by the Supreme Court in favor of the ideas of political minorities "is critical to our understanding of American political structures and the nature of the challenges that face American democracy" (p. 214). The book definitely contributes to scholarship in this area; in fact, it breaks new ground and opens the way for future scholarship.

Race, Redistricting, and Representation: The Unintended Consequences of Black Majority Districts. By David T. Canon. Chicago: University of Chicago Press, 1999. 324p. \$50.00 cloth, \$18.00 paper.

Micah Altman, Harvard University

It is sometimes striking what small use the current Supreme Court has for that which we, as political scientists, regard as empirical evidence. Justice O'Connor, speaking for the Court, showed no inclination to seek out or examine such evidence when, in Shaw v. Reno (1993), she remarked that racially conscious redistricting lines "bear an uncomfortable resemblance to political apartheid" and asserted that officials elected from such majority-minority districts are more likely to represent exclusively members of that minority group. Canon's carefully researched and thoughtfully argued book provides a refreshingly empirical response to the Court's simple assertion.

In essence, Canon argues that black members of Congress can represent white constituents well. The electoral dynamics of majority-black districts often, in fact, causes black representatives to adopt the "politics of commonality" and to draw on a biracial voter base (p. 243). This most often occurs when several strong black candidates run against each other in the Democratic primary, splitting the black vote, and then must make successful appeals to the interests of white voters in order to win the nomination.

Canon begins his argument with an inquiry into the differences between the policy preferences of blacks and whites. Relying primarily on a comparison of data from the 1992 and 1994 National Election Survey, he finds that blacks "have the same issue preferences as whites on nonracial issues" (p. 30). This implies that previous studies that use standard voting scores to gauge the responsiveness of representatives to minority constituents need to be reexamined (e.g., David Lublin, *The Paradox of Representation*, 1997, and Charles Cameron, David Epstein, and Sharyn O'Halloran, "Do Majority-Minority Districts Maximize Substantive Black Representation in Congress?" *American Political Science Review* 90 [December 1996]: 794-812).

Canon's analysis is suggestive, but it leaves the reader uncertain of the importance of the problem. Can the same pattern be confirmed in other surveys and for other times? How large is the difference between, and confidence intervals for, the corrected and uncorrected scores?

Canon continues by examining (with Mathew M. Schousen and Patrick J. Sellers) the "process of candidate emergence" (p. 93) in black districts. He starts with a detailed study of the redistricting process in North Carolina, which he uses to develop a "supply-side" hypothesis. He uses the data to predict successfully most of the contests in seventeen majority-black districts in 1992. The main finding is that the

characteristics of each district determine the racial makeup of the candidate pool in the Democratic primary, which in turn determines the coalition of voters a candidate must attract in order to win. In particular, a large black majority increases the likelihood that several ambitious black candidates will compete. As long as no white candidate enters the race, the resulting split among black voters creates the opportunity for a "new style" of black candidate. This type of candidate practices a politics of commonality and attracts the additional white vote necessary to defeat the "traditional" black candidates, who practice the "politics of difference."

Canon relies on unique data, that is, the political bases of support for and the policy positions of candidates running in majority-minority districts. It is puzzling that he is not more clear about how the data were collected and coded. He states only that he "examined" the policy positions and racial coalitions of these candidates, using data from interviews, newspapers, and public records (pp. 137-8, 265). Much of this information and the data used later in the book were collected from interviews, personal meetings, and constituency mailings and are not reproducible. Canon has opened up new lines of inquiry, but he misses an opportunity to have his research more directly extended by failing to provide replication data. (See Gary King, "Replication, Replication," PS: Political Science & Politics 28 [September 1995]: 443-499, for a description of the replication standard). One hopes that the author will soon place these data in a public archive.

Furthermore, 1992 was not a typical year for majority-minority districts (see David Lublin, "Racial Redistricting and African-American Representation," American Political Science Review 93 [March 1999]: 183-6), and one wonders whether the dynamics that Canon observes apply to other years. Moreover, Canon's supply-side explanation of representational style leaves vital questions unanswered. Is the "politics of commonality" durable—did the new-style candidates remain successful in future elections, and did they continue to maintain their biracial political style and base? Why did so few white candidates compete? Are white Democrats less likely to run in these districts if other white Democratic districts exist? If so, what are the extended supply-side repercussions of making other Democratic seats less safe to create majority-black districts?

After testing the supply-side theory, Canon draws upon a variety of sources—including roll-call votes; an extensive collection and content analysis of congressional newsletters, flyers, and press releases; and an analysis of news coverage—to show that "commonality" representatives are more moderate on racial issues than "difference" representatives. This is, arguably, the book's most significant contribution to the discipline. Canon's analysis of the behaviors of "difference" and "commonality" representatives is, however, mildly marred by a lack of clarity in testing his hypothesis.

The most rigorous tests are six regressions (Tables 4.9, 4.10, 4.14, 4.17, 4.18, and 5.8), in which the independent variable is (typically) a measure of moderateness (e.g., a Leadership Conference on Civil Rights score), and the representational style of a member is represented by dummy variables. Canon discusses whether the individual coefficients were significant and whether members practicing the commonality style appear to be more moderate than those practicing the difference style. Canon does not, however, test explicitly the inference that these representatives behave differently. (For example, he might have computed the confidence interval for the difference between the coefficients for the two styles. Canon does refer to "significant" differences [pp. 190, 196, 236], but it is not clear to which differences he refers, how they are computed, and what is the

associated confidence level.) Without his data, one can only compute bounds on the possible confidence intervals. These bounds confirm that explicit tests are indeed necessary to determine whether the differences in behaviors were significant. In at least one test (Table 4.9) that otherwise would appear to support Canon's hypothesis, the difference clearly was not significant. (Canon does not note this.) Despite the need for clearer tests, however, the weight of the evidence seems to support Canon's theory.

In conclusion, the findings in Race, Representation and Redistricting are of immediate and lasting importance. The variety of data sources and research methods is impressive, as is the effort that the author invested in data collection and coding. Race, Redistricting and Representation should be required reading for anyone with an interest in the linkage between representatives and their constituencies.

Governing with the News: The News Media as a Political Institution. By Timothy E. Cook. Chicago: University of Chicago Press, 1998. 289p. \$48.00 cloth, 17.95 paper.

Steven Chaffee, University of California, Santa Barbara

There is a ritual quality to academic critiques of the press nowadays. One must see deep, virtually irremediable problems and yet offer solutions. One must know a lot about news processes and yet dismiss as naive journalism's working norm of "objectivity," along with "traditional" empirical social scientific inquiry. One must champion diversity and yet not appear to be offering simply another elite prescription. The task becomes doubly difficult when the object of one's hand-wringing is not only the press but also the government. Within these conventional strictures it is hard to write a useful book, but in this case the author has succeeded.

Cook's study originated in teaching a class on the press and American government, and it might serve as a partial text for such courses. It merits review also as original scholarship and as an extended argument. The argument is that the news media "are not merely part of politics; they are part of government" (p. 3) and have been almost from the beginning of the nation. Moreover, something ought to be done about that, although it is not wholly clear just who should do what.

As a textbook, the volume is well organized and readable for advanced undergraduates; it provides an organizing scheme around which more elaborate course assignments could center. Yet, it omits several important parts of an overall picture of political communication. There is no comparison to other systems, no coverage of the large literature on media effects on political opinions and behavior, and surprisingly little content on levels or branches of government outside the White House. The analysis instead emphasizes the "uniqueness of the president's position visavis the news media" (p. 162), although admittedly "all political actors in Washington" use publicity in their efforts to govern.

The substantive heart of the book is an excellent synthesis of historical research on the press-government relationship. It is a very cozy symbiosis, all told, despite journalists' self-professed independent role as watchdogs. Early in the nation's history, favored partisan newspapers got printing contracts and other forms of sponsorship from public officials who needed to communicate with constituents. The American Revolution was egged on by printers angry over the Stamp Act of 1765, a tax that applied to each newspaper published in the colonies. Subsidies such as cheap postage rates for newspapers, selection of supportive reporters to cover official business, and even an administration newspaper

marked the early nineteenth century. But the goal was sheer communication as much as it was a slanted press. Cook points out that "public policy from the outset of the American republic focused explicitly on getting the news to a wide readership" (p. 44).

The sponsored press evaporated after the Civil War, as paid advertising succeeded public printing as the principal source of newspapers' revenue. The government's continuing need to communicate widely led to a new set of institutions directed to that purpose, mainly the creation of press offices to service reporters and thus use "public funds to help generate the news" (p. 44). Public relations specialists became well know under such press-conscious presidents as William McKinley and Theodore Roosevelt. George Creel, hired to direct World War I propaganda for Woodrow Wilson, summed up the American way then as now when he stated: "Censorship policy must be based on publicity, not suppression" (p. 51).

With regulation of radio and television in the twentieth century came new ways for government to shape public communication in the service of public policy. The long tradition of independent editorial review of governmental action continues, but in most instances American journalism finds American government doing approximately the right thing. Typically, a newspaper or public affairs magazine presents the reasons for a policy much more fully than arguments against it.

The press is aided in this work by a remarkable subsidy: thousands of press officers throughout the corridors of power in Washington, each ready with handouts, briefings, and photo opportunities. Thus assisted in their work, journalists focus mostly on official action at the expense of coverage of the problems that give rise to it. Cook feels that most of the time this practice serves to legitimize what is being done officially. Institutional dependence of the media on the formal government is a far more serious problem for democracy, in his view, than partisan political biases one might discern in news personnel or coverage of a contested issue.

A related problem is limited access to the media for alternative voices. This well-documented fact, Cook asserts, results in a narrowing of news content to commentaries pro and con a current governmental initiative, as if there were no third perspective. In a search for "solutions" to recommend, however, he essentially comes up empty—neither journalism nor the government can be expected to do the job—so he leaves off by urging that whatever is done be geared toward widening people's access to news channels and diversifying content.

Some subsidies are inevitable and should continue, Cook concludes (p. 187), but they should be targeted toward economically marginal news organizations, not a few big media. As new communication technologies develop, they should be somehow "crafted to allow maximum access by as many citizens as possible" (p. 189). And the author hopes that public officials can find ways to communicate without the interference of processing by news professionals, an "unelected" class he does not trust to do their job right. He cites cable television's C-Span as a step in the right direction, although he admits that only a small audience awaits additional public affairs telecasts of extended actualities.

The book, although carefully crafted, is not without internal contradictions. Cook's achievement is to bring together an original analysis of political institutions with accumulated scholarship in the field of mass communication. The author employs particularly well the legal-historical school mentored by H.L. Nelson at the University of Wisconsin circa 1960–90. Cook's careful reading of this body of work, which is largely

quantitative and hypothesis-testing, contrasts with his own firm eschewal of parallel analyses in the behavioral school of political science. His approach is in fact essentially empirical, often building on quantitative evidence accumulated by these assiduous media historians.

In parallel spirit, Cook dismisses the journalist's traditional goal of objective reportage, which shares many normative assumptions with empirical social science. He advocates instead "marshaling evidence" in support of one's arguments, both in journalism and in scholarly analysis. It is not surprising, then, that he approves strongly of the movement among mid-sized newspapers toward "public journalism," which involves local media intimately in community problem-solving. At the same time, he singles out journalists as illegitimate political actors: "Who elected them?" (p. 167), as if all parties to public deliberation require prior public approval.

Cook also mocks the tradition of "linear, unidirectional" effects of news media (pp. 10, 12), but in advocating a widened scope of publicity beyond that of controlling elites he assumes effects more powerful than any empirical scholar of media in politics would claim. In these respects, Cook is no worse than many other critics of press and government, but he is not especially original either. Although he offers some thoughtful hopes for a system of institutions he sees as deeply flawed, he does not get us much closer to realistic solutions. In sum, this book is a valuable contribution to the ongoing press-in-politics dialog, and one can learn a great deal here that does not appear as a coherent package elsewhere. But like other works on the subject, it leaves out much of the story.

Religious Institutious and Minor Parties in the United States. By Christopher P. Gilbert, David A. M. Peterson, Timothy R. Johnson, and Paul A. Djupe. Westport, CT: Praeger, 1999. 192p. \$59.95.

Geoffrey C. Layman, Vanderbilt University

In recent years, the apparent growth of public disenchantment with the major parties, the Perot and Ventura phenomena, and the development of the Reform Party have contributed to an increasing scholarly focus on and understanding of third-party politics. Meanwhile, the field of religion and politics has become a scholarly growth industry, as the Christian Right's influence in the Republican Party has grown, and the religious differences between the two major party coalitions have expanded. Surprisingly, however, the paths of these two literatures have not yet crossed; religion has been noticeably absent in explanations of why Americans do or do not support minor candidates. This is the situation that Gilbert, Peterson, Johnson, and Djupe attempt to remedy by examining "systematically the impact of churches and church membership patterns on support for third parties and independent candidates" (p. 3). They contend that religious institutions and American religious adherence work against minor candidates, and they provide a firm theoretical foundation and a wide array of empirical evidence to support that

After introducing the topic in chapter 1, the authors present a cogent theory of religious institutions and minor parties in chapter 2. Drawing on the literature on contextual influences on individuals, they argue that religious institutions shape political behavior not only through their effect on individual religious beliefs but also by providing a social context through which the information that citizens receive about candidates and political parties is filtered. Involvement in the formal and informal social networks within community

institutions should reenforce the dominant values of the community and thus "should operate to the benefit of established political institutions—the major parties" (p. 22). This is particularly true of social networks within religious institutions because of the historical and contemporary ties of religious denominations to the Democratic and Republican parties and because social interaction in church tends to have a stronger effect on individual behavior than does interaction in other settings. Based on this theory, Gilbert and colleagues hypothesize that higher levels of religious adherence within local areas, specifically counties, should lead to lower vote percentages for minor candidates, and individuals with higher levels of religious devotion should be less likely than others to support third candidates.

The authors make a compelling theoretical claim for the importance of religious institutions and their social networks for the enduring political dominance of the Democratic and Republican parties. The case is made even more convincing by the thorough and thoughtful empirical analyses in chapters 4 through 7. Gilbert and colleagues employ a wide range of data—from the National Election Studies, to state-level exit polls, to aggregate data on county-level religious characteristics and election results—and combine individual and aggregate data in nice ways to examine contextual effects on individual political behavior. They also apply sophisticated statistical techniques, including Gary King's method of ecological inference to test individual-level hypotheses when survey data are not available.

In chapter 6, the book turns from national elections to assess the effect of religious factors on state-level voting behavior and minor candidate success. The state focus allows the authors to make use of variations in religious and political contexts that are not present in national elections and to test their hypotheses in situations in which minor candidates actually may have a chance to win. These scholars clearly have in-depth knowledge of state politics and campaigns, which allows them to adjust hypotheses and empirical tests in subtle ways. We learn that religious factors generally work against third-party efforts, even at the state level, but some minor candidates, through appeals targeted to religious audiences and considerable statewide name recognition, can make religion work in their favor.

An important and interesting question raised is whether minor candidates have to find ways to reverse the typically negative effect of religion in order to be successful. The initial answer seems to be in the affirmative, as the authors suggest that the successful minor candidate or party is one that infiltrates the existing social networks in churches and other community institutions: "Candidates who choose not to work through preexisting institutions such as churches are therefore highly disadvantaged from the outset ... candidates, whether major or minor, must gain access to the social networks and institutions in communities" (p. 23). Another possibility may be suggested, however, by one case they discuss—the unusually high success rates of independents in relatively nonreligious Maine-and by one that emerged after the period of their study, the gubernatorial victory in Minnesota of Jesse Ventura, a candidate with no apparent ties to church-based institutions and an outspoken critic of organized religion. Given the historic ties of religious denominations to the major parties, the candidate- and mediacentered nature of modern campaigns, and the fact that the United States is becoming, by some measures, slowly less religious, one way for a minor candidate to find electoral success may be to bypass traditional church networks in order to appeal to secular and nominally religious voters directly through television and other modern campaign technologies.

This book makes a significant contribution to our understanding of third-party politics by showing that the unusually high level of religious adherence in the United States provides yet another barrier to the success of minor candidates. It also suggests interesting paths for further research. One might be a direct test of the authors' theoretical argument. A strong case is made for the idea that the communication networks and patterns of social interaction in churches provide the mechanism for religiosity's negative effect on third-party campaigns. To be sure of that, however, direct examination of those networks and the extent to which they overlook or denigrate minor candidates is needed. An intriguing further step might be to examine whether churchbased social networks tend to give preference to a range of status quo candidates and policies in addition to the established political parties.

Another important question concerns the consequences for third-party politics of the slow growth in American secularism. The findings of this book suggest that such trends should have a positive influence on the chances of minor candidates. Yet, there is some scholarly evidence that secular individuals are becoming more likely to vote for and identify with the Democratic Party. A key question is whether that will negate the potential gains for minor candidates from growing secularism or will open up new avenues for minor candidates to appeal to religious people.

Separate Destinations: Migration, Immigration, and the Politics of Places. By James G. Gimpel. Ann Arbor: University of Michigan Press, 1999. 403p. \$57.50.

James M. Glaser, Tufts University

James Gimpel has written a deceptively complex book. He examines recent migration and immigration trends and very methodically studies the various electoral consequences of these trends. He does this in seven states and in four counties or regions within each state, which allows him to investigate what happens politically in places that gain as well as lose population. And he studies the relationship of migration and politics at two points in time, using data from the 1980 and 1990 census. There is a lot going on, but in the end one big idea shines through: Demographic trends in the United States are reinforcing racial and socioeconomic segregation that has long been in place, and this continuing balkanization of the American population is having deleterious effects on our politics.

The bottom line is not highly original, but by pulling in how migration and immigration patterns feed the balkanization and by looking at participation levels and political orientations in areas of varying degrees of in- and outmigration, Gimpel makes a genuine contribution to an underdeveloped literature. He argues that demographic "humpiness" caused by migration patterns depresses turnout by discouraging political competition (p. 210). Party regularity, "the extent to which party registration matches the balance of party voting" (p. 296), diminishes in areas of growth and change (although not so much in areas of population decline), and this is a by-product of the destabilizing effect of inmigration on a community. He also argues that U.S. demographic patterns make racial and ethnic problems extraordinarily difficult to solve. Pervading the book is a pessimism about how increased balkanization undermines the practice of pluralist politics and encourages instead "the kind of special interest centeredness characteristic of so much contemporary American electioneering," (p. 237) which "places racial and ethnic harmony even further beyond our reach" (p. 279).

A second current running through the book has to do with how immigration and migration shape the political behavior of different groups natives, immigrants, and interstate migrants. This generally involves speculation rather than empirical demonstration, but it is key to Gimpel's argument. Underlying much of the analysis is a social psychological orientation that explains individual political behavior by way of group dynamics. For instance, Gimpel shows that immigration of nonwhites often leads to aggregate political patterns that suggest native hostility, and he interprets this as a response to group threat. He also shows that immigrant groups who attain a critical mass tend to be more spatially isolated, either because of their own inclination or because of discrimination in the outside world. Gimpel demonstrates, in some of the most compelling parts of this work, that the attitudes and behavior of both natives and immigrants (and in some cases, migrants) are shaped by their own-group orientation and by the interplay of groups within some politically relevant boundaries.

Also important in Separate Destinations is a discussion of the suburbanization of the country and what that means politically. The maps illustrating the growth of suburban sprawl are vivid and reinforce the impressions one gets driving around the outskirts of many metropolitan areas. This powerful demographic trend is not without political consequence, and Gimpel demonstrates how the transient nature of suburbia has been a net minus with regard to politics. Those moving into places such as suburban Kansas City or Denver are less participatory and less connected to issues in their community or state, two things that go together. In addition to the issue of sprawl, which Gimpel generally does not address, the suburbanization of America has contributed greatly to the race- and class-based balkanization that concerns him so much.

Gimpel accomplishes a great deal, but the book is not without problems. One—that the author recognizes and frets over-stems from the extensive use of ecological data. The main unit of analysis is the county or Census tract, and Gimpel looks at the relationship between demographic balance in these units and various dependent variables, such as turnout and party regularity. He is generally careful about not using the results to make inferences about individual behavior, he tries to replicate his findings with individuallevel data, and he occasionally relies upon Gary King's ecological inference maximum likelihood technique to deal with the problem. Nonetheless, in many instances his findings are limited, and his main defense is that he has not written a book about individuals, such as Thad Brown's Migration and Politics (1988), but a book about places, about what happens politically in places that gain or lose population.

A second problem revolves around the implications of Gimpel's findings. The author wrings his hands over homogeneous, noncompetitive electoral districts and the shortcomings of single-interest representation (p. 139), but although balkanization may be a necessary cause, it is certainly not a sufficient cause of problematic districting. In addition, he raises concerns about the possible skewing of policy outcomes as a result of balkanized politics, but these arguments are not developed at all. Finally, it is clear that increased participation is a good thing and depressed participation is not, but it is never very clear why the other main dependent variable—party regularity—is a matter of great concern. Gimpel argues that "party regularity matters because partisanship is a reflection of what divides, animates, and mobilizes the electorate." Where party regularity is upset, "judgments [by representatives] based on party cues are more error prone and electoral accountability can be

undermined" (p. 333). But this justification seems a stretch (indeed, electoral accountability is likely to be enhanced by greater uncertainty in results), which is unfortunate, given how much of the analysis is dedicated to it.

Despite its shortcomings, Separate Destinations is very good. It is comprehensive and well argued. It is fascinating and fun for "mapaholics" like myself. And it is a book of importance, one that helps explain how demographic and political changes are related in this extraordinarily mobile society.

Calculating Risks?: The Spatial and Political Dimensions of Hazardous Waste Policy. By James T. Hamilton and W. Kip Viscusi. Cambridge, MA: MIT Press, 1999. 336p. \$37.50.

Brian J. Cook, Clark University

James Hamilton and Kip Viscusi have produced a wideranging, detailed examination of Superfund, the national program for cleaning up hazardous waste sites. They focus on the nature and extent of the risks posed by Superfund sites, the manner in which regulators determine risk estimates, the societal costs and benefits of site remediation decisions, and explanations for the patterns of decisions about risks, resource allocations, and the resulting distributions of benefits and burdens. This is roughly the order of the first six chapters. The final three chapters cover, respectively, the environmental justice implications of risk estimates and remediation decisions, housing market evidence regarding private risk estimates, and the effects of several proposed regulatory reforms.

The authors rely on a sample of 267 nonfederal Superfund sites, based principally on sites that had records of decisions available when the study began in 1992. The bulk of the findings, however, is based on a 150-site subsample for which they were able to compile detailed site-level risk assessments. After subjecting the subsample to detailed quantitative analysis, Hamilton and Viscusi generate a substantial volume of policy-relevant findings, about which I can only report the briefest of particulars here.

They find that the mean cumulative lifetime cancer risk for the 150-site sample is 7 in 100, with a median of 25 in 10,000. These figures are quite high, given that the trigger for required remediation under Superfund is 1 in 10,000, and the lower bound for at least considering action is 1 in one million. The authors report a median cost per cancer case averted at the 150 sites of \$388 million. This compares quite unfavorably to a reference point of \$100 million, which represents the cost-per-life-saved threshold below which "the Office of Management and Budget has never rejected a proposed regulation" (p. 223).

The whole point of the analysis in Calculating Risks? is to critique the EPA methods and the larger Superfund decision-making process that have yielded these numbers. Thus, the authors find that Superfund's statutory foundation, the EPA guidelines for preparing risk estimates, and the process for selecting the type and extent of site remediation have resulted in vastly overstated risks associated with Superfund sites. These same factors have produced remediation expenditures that far exceed any reasonable public standard for preventing both cancer and noncancer health effects. They also far exceed the private willingness-to-pay behavior exhibited by people who live in proximity to Superfund sites.

These risk estimate and cost-benefit findings, as well as the extensive details that underlie them, deserve extensive scholarly and public scrutiny because Superfund is such a highly

visible, widely recognized public policy. The author extends their analytical foray into the political dimensions of Superfund site-level decision making and its effects, and it is to these dimensions that I believe readers of this *Review* will be drawn.

Hamilton and Viscusi point out that Superfund site-level risk assessment and remediation processes are highly decentralized. EPA regional managers are principally in charge; their decision making is restrained by statute, regulation, and agency policy guidance, but they retain considerable discretion. Hamilton and Viscusi conclude that this discretionary decision making is shaped principally by two forces: risk "biases" and local political influence. The biases may be internal to the agency regulators, meaning their own misperceptions of risk may lead them to employ overly conservative assumptions in making risk estimates. The biases may be external, reflecting the misperceptions of residents around a Superfund site, whom the regulators in some sense represent. The local political influence, the authors conclude, is manifested in varying levels of collective action. That is, if residents are highly mobilized politically (as measured by the authors through the proxy of voter turnout), then regulators are likely to reach overly protective risk estimates and to pursue overly stringent cleanup efforts.

In response to political pressure, and because of deviations from "full information versions of expected utility theory" that produce "perceptional biases," "irrational responses to risk," and "errors in risk judgment" (p. 129), EPA managers do not behave in accord with "efficient policy design" (p. 154). This seems an oddly narrow and overly restrictive interpretation of what is going on, reflecting the authors' exclusive devotion to economic rationality. I would argue that rational choice theory and research on risk perception and risk communication suggest that both the residents and EPA managers are behaving in politically rational ways. The managers are responding to forces in their environment that touch on critical components of their utility calculus. Residents are responding to what resources are available to them and what they can and cannot control but would like to achieve with respect to their exposure to health and environmental risks.

This is a very interesting, complex collective action problem, and I find it curious that the authors fail to examine it from this perspective. The reason appears to lie with the unidimensional measuring stick they use to judge regulator behavior. "Our results indicate that greater scrutiny from residents pushes regulators away from decisions likely to maximize social welfare" (p. 155), but this is social welfare narrowly defined. It does not take into account the value to residents of engaging in collective action or the value of being able to control through public means what they cannot control through private, market transactions and limited private resources. For public managers there is the value of being responsive to the public being served.

All this is not to say that in the end the "social welfare" calculation would come out differently. Hamilton and Viscusi make the extremely powerful point that by paying greater heed to efficiency considerations, EPA managers may in fact "enhance equity" (p. 188), because most of the sites in their sample around which substantial minority populations reside would pass the benefit-cost test they propose to apply. Strangely, however, they recommend more discretion for program managers as a way to achieve greater program efficiencies, without explaining how the managers will be able to resist the political pressure to which they are already subject. One can infer from their research, although this is not explicitly stated, that a more effective risk communication

strategy must be part of achieving the efficiency results they seek.

Despite the volume, depth, and detail of the quantitative analysis, the authors fail to provide a convincing empirical foundation for several of the more speculative conclusions they reach about political behavior. Such a foundation would most likely have to be compiled through more qualitative research, looking in depth at the perceptions and decisionmaking strategies of both residents and regulators. Nevertheless, I find much to appreciate in Calculating Risks? It is a significant achievement in terms of substantively comprehensive and methodologically sophisticated policy analysis. The book deserves the attention of scholars and practitioners in the policy and decision sciences as well as in environmental studies. Because the book offers a range and depth of material that is far more than one review can adequately assess, I call on other scholars to give it close scrutiny and engage the authors in an exchange of ideas over the full spectrum of issues they raise about Superfund.

Reading Public Opinion: How Political Actors View the Democratic Process. By Susan Herbst. Chicago: University of Chicago Press, 1998. 256p. \$41.00 cloth, \$16.00 paper.

John Brehm, Duke University

Susan Herbst tackles the vital question of how political decision makers conceive of public opinion and its role in representative democracy. The preponderance of scholarship asks questions about the nature of opinion itself. What does the public believe, and why does it hold such opinions? Some scholars asks whether public opinion translates into policy outcomes. But research is considerably sparser when one turns to the mechanisms by which public opinion influences or fails to influence policymakers, and it is this role that Herbst's splendid book considers.

Specifically, Herbst combines intensive interviewing and survey analysis to study how legislative staffers, journalists, and party activists understand public opinion and its relation to policymaking. The intensive interview sample draws from Illinois state government for the staffers and journalists, and a national sample of party activists is used for the survey analysis. Herbst is quite persuasive in her argument that subnational politics serves as a useful and important lens for examining the role of public opinion: Much of the policymaking that matters to people takes its form in the decisions by state government. Furthermore, the pragmatic issues of state government may create opportunities for citizen opinion to influence concrete decisions by state legislators. Illinois is an important state, composed of urban, suburban, and rural constituencies, and a reasonable basis on which to consider how political elites might attend to the opinions of the public. Herbst is careful, however, to avoid overgeneralizations from one state at one moment in time.

Herbst's reliance on in-depth interviewing carries the usual advantages and disadvantages. The reader learns more about the causal reasoning of the diverse actors than might be available from a more rigid survey instrument. Their logic is made all the more palpable by Herbst's liberal use of direct quotations from interviewees. Of course, there are always the questions of the replicability of such intensive conversations, whether interviewees responded along the lines of what they thought Herbst wanted to hear (demand effects), and whether the findings can be generalized to a broader population. Herbst takes considerable pains to document her methods, and the appendices provide ample detail on the

interview protocol and sample selection. Furthermore, survey-based methods are not immune from demand effects.

Herbst finds that staffers think of public opinion in terms of what "groups" have to say but do not put much stake in public opinion polls or even elections. The staffers report that polls are not very useful in policymaking; they consider the public too fickle and uninformed, and the polls themselves are too vague to provide much guidance. In this regard, Herbst's work is quite consistent with John Kingdon's observations about the decisions of members of Congress. The staffers view the public as more reactive than influential in the formation of policy.

Like the staffers, the journalists tend not to think of public opinion as aggregate opinion; they tend to regard public opinion as a "conversation" sensed by members of the press. The journalists are remarkably asystematic in their assessment of public opinion, relying more on an "imagined" public than on more careful study.

In the chapter on party activists, Herbst makes an abrupt shift from intensive interviews with people in Springfield, Illinois, to a national sample. Unlike the staffers and the journalists, the party activists do consult polls as a principal means for assessing public opinion. Like the staffers and journalists, the activists also generalize based on conversations with real individuals. The shift from state to national is too abrupt, and one questions whether the greater use of aggregate data by the national activists is the result simply of a shift in venue. The national public may be more occupied with less technical issues, more frequently surveyed than state populations, may be more heterogeneous, and perhaps more amenable to aggregation.

It is also surprising that, apparently, none of the three groups mentioned any real constraints on their authority that stem from the public. For the journalists, readership, advertising dollars, and market share all lead to important tensions in their presentation of public attitudes. For the staffers and party activists, it is surprising that they apparently put little stock in elections when considering what the public wants.

Herbst's discussion could be better connected to relevant work on the micro- and macroanalyses of public opinion and representation. James Stimson, Michael MacKuen, and Robert Erikson ("Dynamic Representation," American Political Science Review 89 [September 1995]: 543-65) surface only in a footnote, although their idea is clearly pertinent and in may ways quite sympathetic to the general thrust of Herbst's argument. The literature on "framing" effects enters only minimally, yet it clearly focuses on an important relationship among representatives, the media, and the public.

Of course, scholars in the field know that "public opinion" means more than a simple aggregation of surveys and polls. Herbst's book is particularly compelling in its argument that political actors themselves conceive public opinion in broader terms, as a conversation with rich reasonings and casual understandings that can elude surveys. Reading Public Opinion is an important and sizable step in the direction of understanding how public opinion works in representative democracy.

The Unsteady March: The Rise and Decline of Racial Equality in America. By Philip A. Klinkner with Rogers M. Smith. Chicago: University of Chicago Press, 1999. 417p. \$32.50.

Lawrence D. Bobo, Harvard University

In a theory-driven political history of race in the United States, Klinkner and his collaborator openly challenge two

modern shibboleths. First, they debunk the claim that the force of lofty values of equality and fairness—the American creed-will lead inexorably to racial progress. Second, they debunk the claim that the current level of black advancement is secure and now self-sustaining. In the place of these bulwarks of "the new color blindism," Klinkner and Smith erect a three-part analysis of the halting state of racial progress in America. They suggest that significant improvements in the status of African Americans have occurred only in certain circumstances: in the wake of a major war effort that requires the mobilization of large numbers of African Americans; when the nation's enemies are such that wartime ideology stresses egalitarianism, inclusiveness, and achieving greater democracy; and when strong domestic protest movements demand fulfillment of democratic ideals. To wit, progress for blacks has always required serious external threats and depended upon vigorous internal pressures from below. Without these conditions, history makes it clear that institutions of American government, and indeed the mass of white Americans, are quite ready to tolerate the oppression and exploitation of African Americans.

Accordingly, Klinkner and Smith find only three periods of significant improvement in the status of African Americans: immediately following the Revolutionary War, immediately following the Civil War, and in the two decades following World War II. After each period, however, there was substantial retrogression and sometimes quite disastrous deterioration in the status of blacks. If not openly pessimistic, this highly contingent and "two steps forward, one step back" model of racial change cautions strongly against naive claims that America's high moral values always prevail. As the authors argue, "many Americans have always been able to tell themselves that they were remaining true to their best ideals, the advancement of white Protestant civilization, a noble common cause endangered by what they genuinely believed to be misguided and destructive radical egalitarianism" (pp. 6–7).

Although not a work of primary historical analysis, the book's argument is an historical one. In chronological fashion. Unsteady March traces sequences of events, the changing views of significant historical figures (e.g., George Washington, Abraham Lincoln, Harry Truman), and tries to craft a rich portrait of different eras and their human meaning. The authors show quite convincingly how wartime exigencies facing Washington in the Revolutionary era, and Lincoln later in the Civil War era, resulted in substantial military roles for African Americans and the concomitant effect of such service in buttressing blacks' claims for better treatment. Most telling, Klinkner and Smith also make it clear why World War I, the Spanish American War, and other military engagements failed to rise to the level of mobilization and threat needed to inspire domestic protest or to provide leverage for democratic reform. They also give telling illustrations of how some black allies of one era (the Civil War), such as white abolitionist Charles Francis Adams, Jr., would be important players in rationalizing a later era of retreat (rise of Jim Crow), a pattern seen later in the wake of the civil rights gains of the 1960s (e.g., Daniel P. Moynihan and "benien neglect").

In each period, Klinkner and Smith devote commendable attention to the currents of thought and protest among African Americans. For example, they give extensive consideration to the roles of Booker T. Washington, W. E. B. DuBois and the NAACP, Marcus Garvey, and later A. Philip Randolph and the "March on Washington" movement. They also do much to convey the great symbolic import of such events as Joe Louis's defeat of German boxer Max Schmel-

ing. The episode, like many they recount, is not just historical embroidery. It bears directly on their argument about the importance of external threats and democratic rhetoric. When Louis lost his first bout with Schmeling in 1936, most American news media and elites treated the outcome as a victory for the white race (including the U.S. Senate, which burst into applause and stopped business when the result was announced). Yet, by 1938, with a mounting Nazi threat in Europe, Louis's victory was more often read as a triumph for freedom and democracy against an emissary of fascist government.

Unsteady March offers a painstaking analysis of how Cold War imperatives profoundly reshaped the level of national elite support (or tolerance) for Jim Crow racism. Klinkner and Smith are equally careful to document how the service and sacrifices of black troops during World War II emboldened blacks and increased the moral leverage behind their claims on American democracy. A quite strong case is made that federal government responsiveness to black demands for civil rights grew at least as much from a self-interested concern for how "the leader of the free world" was viewed abroad in the struggle against communism as from any genuine sense of morality or deepening comity with African Americans.

Among the most provocative aspects of the book is its enumeration of eleven strong parallels between the current social context and the rise of Jim Crow racism from the ashes of Reconstruction during the nineteenth century. The first four are particularly troubling, since they are notable aspects of the current climate and definitely set a stage for the next round of "one step backward." These are: a resurgent emphasis on states' rights and local decision making, and a retreat from national government authority; calls for "colorblind" policies and a retreat from "special treatment" of minorities; resurgence of free market or laissez-faire ideologies; and a resurgent respectability for scientific racism. The full effect of these then, and perhaps now as well, was deterioration in the status and living conditions of many African Americans.

There are three problems with the argument Klinkner and Smith develop. First, perhaps because this is theory-driven history, the book sometimes reads as if only the evidence in support of the basic argument is selected for inclusion. To be sure, in the end I am largely persuaded by the argument. A primary historical account, I suspect, would have dealt more extensively with the countercurrents that surely did exist. Second, and more troubling, the argument leans too heavily toward privileging politics; it is a sociologically underdeveloped theory. Too little attention is dedicated to the economic, demographic, and other social forces that have played substantial roles in facilitating progressive racial reform. For example, such profoundly important works as William Julius Wilson's The Declining Significance of Race (1978) and The Truly Disadvantaged (1987) are not mentioned at all. And the central importance to black progress of an expanding economy, for instance, is only dealt with implicitly.

Third, the argument lacks an explicit conceptual underpinning about the nature of racism and the well-springs of white animosity to African Americans. Klinkner and Smith repeatedly use the phrase "racial hierarchy," invoke Du Bois's notion of the "psychological wages" of whiteness, and generally craft a power and interest-group analysis of the dynamics of race relations. It is ironic, then, that at the end of the book they endorse Donald R. Kinder and Lynn M. Sanders's racial resentment theory (Divided by Color, 1996), rather than Blumer's group position approach, Jackman's ideological control and paternalism theory (The Velvet Glove, 1994), or

other power and conflict models of racism (again, perhaps, reflecting the lack of engagement with much of the closely allied sociological research).

In the main, however, *Unsteady March* is a serious political history that must be attended to by anyone concerned with the American racial divide. Indeed, it is a long overdue antidote to much recent cavalier theorizing that race only became "political" after the civil rights era and to the equally ahistorical and misplaced calls for a "color-blind" polity. In an age of much political and scholarly mendacity on the matter of black-white relations, Klinkner and Smith pose the tough questions and offer a sobering set of answers about the nation's complex and enduring struggle over race.

Legal Advocacy: Lawyers and Nonlawyers at Work. By Herbert M. Kritzer. Ann Arbor: University of Michigan Press, 1999. 269p. \$44.50.

Marc-Georges Pufong, Valdosta State University

What difference does a lawyer make? That is the central question of Kritzer's book, which asks to what degree non-lawyers should be prevented from providing services in competition with licensed attorneys. Can nonlawyers be effective legal advocates? Should licensed lawyers continue to hold an unfettered monopoly over the provision of legal services? The effectiveness issue hinges on competency in actual legal representation afforded to the public, whereas the licensing issue has to do with the monopoly of legal services.

The exclusion of nonlawyers from providing law-related services is a twentieth-century phenomenon, largely a product of the development and growth of the organized bar associations during the 1920s and 1930s (see Richard Abel, American Lawyer, 1989). The rising concern over the high cost and quality of legal representation in the United States has led many people to argue that formally trained lawyers should not be the only effective advocates. A handful of states have conducted studies and others are considering legislation that will allow nonlawyers under specific and limited circumstances to provide routine legal services to the public.

Since its inception in 1878, the American Bar Association has fought any move in that direction and has generally been successful in limiting potential competitors. The United States is alone among common law countries in prohibiting nonlawyers from handling certain kinds of representation outside the courtroom. In England, solicitors are free to represent injured persons up to the stage of actually filling an action in the court. In Canada and specifically Ontario, nonlawyers routinely provide representation in the traffic courts as well in other lower court proceedings that include workers' compensation boards (see Harry Abraham, Judicial Process, 1993).

In the United States, most of the debate has taken place in the absence of meaningful empirical data about how lawyers and nonlawyers perform similar tasks or about the benefits of nonlawyer provision of legal services. Kritzer presents more than benchmark data. He provides a conceptually parsimonious way of looking at the debate backed by systematic research of these issues of legal practice by lawyers and nonlawyers. He focuses on four substantive areas: unemployment compensation appeals (chap. 2), tax appeals (chap. 3), Social Security disability appeals (chap. 4), and labor arbitration cases (chap. 5).

To compare differences between nonlawyers and lawyers, Kritzer uses both quantitative and qualitative data to evaluate advocacy and representational skills and effectiveness, broadly defined. For example, for the qualitative evaluation, he examines key attributes of efficacy that establish whether an advocate (1) recognizes the core questions at issue in a case, (2) engages in quality questioning of the witnesses, (3) presents evidence that is related to the issue being decided, (4) has adequate resources, (5) prepares clients for hearings, and (6) has the ability to counter or respond to issues raised by the opposing side or by the third party, such as adjudicators and mediators (p. 21). For the quantitative assessment, Kritzer uses samples from actual representation in the four key issue settings to compare lawyer and nonlawyer advocacy styles and abilities. His analysis shows that nonlawyers can be effective advocates and, in some situations, are more effective than professional lawyers.

In the area of unemployment compensation appeals (chap. 2), Kritzer focuses on Wisconsin, which has a fairly restricted eligibility criterion for unemployment compensation that results in numerous disputes between claimants and former employers or the agency administering the program. Kritzer found that although the judges in the appeals are experts and know the law and the evidence, the presence of a knowledgeable advocate makes a great deal of difference to the outcome of the case (p. 50). He concludes that knowledgeable and experienced nonlawyers can be effective in representing parties in these hearings, and formal training in law is less crucial than day-to-day experience in specific situations (pp. 76-7).

In the area of state tax appeals (chap. 3), Kritzer focuses on the Wisconsin Tax Appeal Commission to unravel the question of whether a lawyer or nonlawyer makes a difference (p. 79). Since taxpayers by right can turn to the commission to resolve their disagreements with the Wisconsin Department of Revenue, this arena attracts a pool of tax cases coupled with a highly technical and complex tax code. It also attracts different kinds of taxpayer advocates, namely, lawyers and nonlawyers who are tax specialists. Kritzer maintains that in tax disputes an expert representative is crucial to a successful appeal. In considering the comparative effectiveness of lawyers and nonlawyers, he observes that even though nonlawyers have an extensive "substantive expertise" in tax matters, they lack procedural expertise in court. The problem, Kritzer notes, is that they simply do not know how to appear as advocates in a formal legal hearing. They know what constitutes "a record" for tax purposes, but they lack legal knowledge about how those records could be used for evidentiary purposes in court (p. 108). Kritzer concludes that lawyers are far better equipped with "procedural expertise" than nonlawyers, especially in identifying and presenting evidence.

In examining representation in Social Security disability appeals (chap. 4), Kritzer reveals a small and statistically insignificant difference in effectiveness that favors lawyers over nonlawyers (p. 116). He argues that the small ratio is due to the fact that a clearly defined group of lawyers have substantial expertise in this area, whereas in the area of unemployment compensation there are few, if any, lawyers who are specialists in either the law or the hearing processes (p. 148). He also maintains that the difference in the lawyernonlawyer success ratio reflects the type of cases handled by each group. Licensed lawyers work on a fee-for-service or contingent fee basis, which may create incentives for them to screen out weak cases. In contrast, nonlawyers often work for agencies whose mission is to provide representation to lowincome persons and therefore do not select their cases on ability to win or monetary compensation (pp. 116-7).

In chapter 5, Kritzer focuses on labor grievance cases that usually result in arbitration. This area is interesting and worthy of examination because it regularly pits experienced

lawyers against experienced nonlawyers (p. 151). Kritzer maintains that arbitration hearings most closely resemble the traditional courtroom situation (but without the jury). These decisions are taken seriously by the parties involved because the ruling in one case may affect future cases, contract negotiations, and/or relationships among the parties (pp. 152–3).

Using data from the Wisconsin Employment Relations Commission, Kritzer concludes that there is no difference between nonlawyers and lawyers in terms of the quality of legal representation provided in the arbitration cases. To Kritzer, however, attributes such as experience and substantive expertise do matter. Therefore, despite the sheer percentage of cases won by lawyers on behalf of the unions over nonlawyers, the difference is not statistically significant, which means it is more likely a chance occurrence than otherwise. Similar findings have been noted by Doris Marie Provine (Judging Credentials: Nonlawyer Judges and the Politics of Profession, 1986) for nonlawyer and lawyer judges, but Kritzer maintains that the findings in chapter 5 contrast with those of Richard Block and Jack Stieber (The Impact of Attorney and an Arbitrator on Arbitration Awards, 1987), who reported differences between lawyers and nonlawyers.

Kritzer provides a solid basis for understanding the differences in legal advocacy, effectiveness, and ability of advocates with radically different legal training. This is a noteworthy book, and there is value in extending this approach to other areas, such as medicine, where similar debates about licensing are taking place. It cannot be said that all chapters in the book are equally well written, and aberrations can hardly be avoided. They may perhaps be attributed to the differences in the approach adopted and, especially, the laborious method of data gathering, which seemingly was improvised for each of the four case areas. For example, because of the differences in the legal processes, the advocates, and the cases themselves, there is no single integrated analysis either of the quantitative portion of the indicators or of the qualitative data used in the study. This is somewhat complicated and confusing, even if the approach is perfectly suitable for this study. Nevertheless, faculty and students of the sociology of professions and public law will find this book extremely important for research and seminar reading.

Debating War and Peace: Media Coverage of U.S. Intervention in the Post-Vletnam Era. By Jonathan Mermin. Princeton, NJ: Princeton University Press, 1999. 162p. \$45.00 cloth, \$14.95 paper.

Richard A. Brody, Stanford University

Debating War and Peace is energized by empirical and normative questions about the American people and foreign policy. The empirical questions deal with the breadth of information and policy debate available to the public about U.S. military interventions. Because most Americans are dependent upon news media for this information, Jonathan Mermin examines press practices that shape the gathering of information during periods of U.S. military deployment in the service of foreign policy. The empirical analyses lead to the conclusion that "coverage of U.S. intervention in the post-Vietnam era [in the mass media sources studied] made no independent contributions (except at the margins) to foreign policy debate in the United States. The spectrum of debate in Washington... has determined the spectrum of debate in the news" (p. 143).

The normative concerns of the book stem from Mermin's opinion that the news media short-change the American

people. By narrowly restricting debate about military intervention to the views of government officials, the press fails in its First Amendment responsibility to give the public the information it needs to play its role in the American democracy. If, Mermin opines, "the source of information on American foreign policy is the U.S. government, then what is being reported is not the story, but a story, one told by a powerful interested parties: Democrats and Republicans... much less of a difference than meets the eye" (p. 145). By restricting the debate to that offered by official Washington, the press neither acts as an independent watchdog nor fully mirrors the policy debate in the country at large. Under these circumstances, "it is hard to argue that the First Amendment ideal is being fulfilled" (p. 145).

It is easier to assess the empirical claims of the book than to evaluate its normative opinion that the press has not fulfilled its First Amendment responsibilities. The empirical analyses seek to establish to whom the press turns for comment on U.S. military intervention in foreign affairs. Mermin addresses this question in an appropriate and fully satisfactory manner. The source options for the media are either elites within or closely connected to government or those who can offer an independent perspective.

The study results are unambiguous: The media overwhelmingly rely on those now in government, those formerly in government, or on other journalists for the terms of debate. Mermin illustrates the narrowness of the circle with data on the affiliation of guests on the MacNeil/Lehrer Newshour programs covering eight military interventions after the Vietnam War (Table 2.1, p. 31). More than 70% were former government officials (31%), other journalist (21%), and current government officials (20%). Four percent of the guests were from Washington think tanks, and foreign observers comprised another 11% of the "experts" on the show. Only one commentator in eight came from outside Washington or the press corps. Data from the case studies-Grenada, Panama, and the crisis, military buildup, and war phases of the Gulf War-are equally unambiguous: The news presented to the American people in the first two weeks of these military interventions was derived primarily from sources in Washington. Moreover, Mermin's analyses of the direction of commentary on these military interventions shows that in the main it was supportive of the president's actions.

Mermin's normative complaints are harder to evaluate and can be addressed from several points of view. One can raise questions about Mermin's characterization of the First Amendment "ideal." Surely, there is a literature upon which he could have drawn to buttress his version of press responsibilities and privileges under the First Amendment. His criticism of a press that covers foreign affairs by "indexing" the debate among elected officials seems to reject republicanism. He, of course, has the right to reject republicanism, but in light of the structures built into the Constitution, that is an odd right to exercise.

Mermin's complaint about the restricted set of news sources ignores evidence on the public opinion consequences of elite criticism of presidential actions in an international crisis. If the media report a breakdown in support for the president's handling of a crisis, among those Mermin considers "insiders," a rally of public support will fail to materialize or will be terminated. It would be interesting to know if "outsider" criticism affects public opinion in a similar manner.

More generally, Debating War and Peace proposes "prescriptions" for "grant[ing] sources outside of Washington greater access to the news" (pp. 145-50) and, presumably in

consequence, for changing the balance of information available to the American people. Mermin argues that the press could better match the First Amendment ideal if, among other things, it consulted foreign policy experts, especially academics, outside Washington; reported the reactions of engaged citizens, such as those organized in groups like Peace Action or the American Friends Service Committee; and expanded critical analysis of the execution of U.S. policy to encompass the policy itself. These are interesting suggestions, but whether they would add to the knowledge people bring to bear in evaluating U.S. foreign policy is an empirical question, not merely a matter of the author's opinion. These suggestions seem more appropriate as ways of opening up the debate on U.S. foreign policy, in general, and less apposite to the fast-breaking, critical situations in which military power is used, such as the cases that comprise the empirical foundation of the book. The daily press may not be the best forum for the wider debate, but "outside" sources—as coverage in Seattle showed on the WTO and in Washington on the IMF and World Bank—certainly affect the information we get on foreign policy in general.

The Missing Majority: The Recruitment of Women as State Legislative Candidates. By David Niven. Westport, CT: Praeger, 1998. 208p. \$59.95.

Edith J. Barrett, University of Texas at Arlungton

For the past quarter-century, women politicians have been slowly gaining access to more and higher elected positions. Given where women politicians were not long ago, the progress seems great, but based on the radical changes in women's nonpolitical lives, one would have predicted greater strides in politics as well. David Niven asks why women have not gotten farther than they have. This is not a new question, but as long as advancement remains minimal, it is one that should be continually addressed.

Niven tests the hypothesis that there are few women political candidates because male party leaders, acting as gatekeepers, prefer candidates similar to themselves. The author pits this hypothesis against the rival notion that women candidates do not advance because they are not in the occupations that traditionally lead to public office. He focuses on the recruitment stage, because that is the point at which women enter the scene. Unless they are recruited as candidates, they cannot be elected to office. To begin to understand why there are disproportionately few women in public office, it makes sense to begin by asking why there are disproportionately few women running for public office.

Niven surveyed a sample of county party chairs and women holding local elective office, who are taken to represent potential state legislative candidates, in California, New Jersey, Ohio, and Tennessee. The party chairs were asked what they see as traits of a winning candidate (e.g., occupation, personality, gender); they were also asked about the recruitment process they use, their perception of biases in the process, and the strength and ideology of their locals party. Local female elected officials were asked similar questions to preferred characteristic of officeholders, how the recruitment process works, biases in the process, and ideology of local parties. The women were also asked about their political career aspirations. The study surveyed 280 county party chairs (a response rate of 54%) and 276 potential women candidates (a 53% response rate).

Although the recent presidential candidacy of Elizabeth Dole probably convinced most in the public that the party elite treats women candidates differently from male candidates, the issue is still debated in the literature (see, e.g., R. Darcy, Susan Welch, and Janet Clark, Women, Elections, and Representation, 1994; and Brian Werner, "Bias in the Elec-

toral Process: Mass and Elite Attitudes and Female State Legislative Candidates, 1982-1990," Ph.D. diss., Washington University, 1993). Dole, similar to rival George W. Bush in so many of her leadership credentials as well as in her political style, was given virtually no attention by the party elites. Indeed, the findings from Niven's survey suggest that there is some gender bias in the selection of candidates. The majority of the surveyed women officials reported that they had experienced bias personally, and the responses from the party chairs indicated that bias may exist within that group. For example, the latter tend to believe that female candidates have less chance of winning an election than male candidates, and especially the male party chairs rated male personality characteristics as more positive in a candidate than female characteristics. An examination of potential causes and ramifications of this bias fills the remainder of the book.

Twenty years ago, Rosabeth Kanter ("Some Effects of Proportions of Group Life: Skewed Sex Ratios and Responses to Token Women," American Journal of Sociology 82 [1977]: 965-90) suggested that once women enter the business world in large numbers, their actions will no longer be seen by men as inferior, and they will gain the respect of their male colleagues. Niven, too, found that party leaders in counties with a high number of women elected officials are less likely to see women as an outgroup than are leaders with fewer contacts with women colleagues. Party leaders, like humans in general, make assumptions about people with whom they have little personal experience. To the extent that the leaders have little information about the abilities of potential female candidates, they are more likely to use stereotypical assumptions, which quite often tend to be biased against the women. Leaders who are older, who have been in their position longer, and who wield a great deal of power in their party tend to be most likely to see women candidates as different from themselves and, hence, less appropriate for elected office. As these leaders retire or leave office and are replaced by younger, less singularly powerful party chairs, Niven predicts that bias against women candidates will decrease. Scholars of women in politics have been making this prediction for years, and it does seem to be bearing out. But the process is slow, and women still remain grossly underrepresented in high public office.

My major complaint about this book is that the writing style is dull. Although an occasional student can write a dissertation that reads as good as a book, most cannot. The dissertation genre of writing—an extensive literature review, followed by methods, findings, and conclusions serves its purpose well. When dissertations become books, however, the style needs to change to keep the reader interested in what the author has to say. The Missing Majority could have been so much more if the author had taken a little extra time to flesh it out beyond the original single hypothesis, to put the findings into a larger context of minorities seeking public office guarded by majority gatekeepers, and to add recommendations for change in the concluding remarks. Readers will find the contents worthwhile, but they may feel as though the same information could have been conveyed through one or two well-written journal articles.

Policy Reform in American Agriculture: Analysis and Prognosis. By David Orden, Robert Paarlberg, and Terry Roe. Chicago: University of Chicago Press, 1999. 270p. \$38.00.

James Anderson, Texas A&M University

Two economists and a political scientist have joined forces to produce this thoughtful, thorough, and carefully constructed study of agricultural policy reform. Specifically, the focus is on farm price and income support programs (or simply, the farm programs), which historically have combined financial assistance to farms with restrictions on crop production. Reform, as the authors specify it, involves reducing the intrusiveness of these programs, ideally culminating in their elimination. Although they aver that their "analytic tone remains more positive than normative" (p. 11), their ideological preference for the market shapes the narrative.

Reform of the farm programs is analyzed using the categories developed in a four-cell matrix. Reform can be instituted gradually over time or quickly; compensation may or may not be provided to farmers affected by reform. On this basis, a gradual, compensated closeout of farm programs becomes a cash out, whereas quicker, compensated elimination is a buyout. Slow reform without compensation is a squeeze out; quick, uncompensated repeal of the farm programs have been cast, whether successful or not, as cash outs.

The authors acknowledge, albeit a bit grudgingly, that the farm programs were justifiable in the 1930s because of the Great Depression. Due to the scientific, technological, and economic transformation of American agriculture, however, they are no longer needed. Briefly stated, their case for reform is this. The farm programs have done little to increase agricultural productivity, although other government policies have been helpful here, and they have not done much to reduce regular poverty. Producers of commodities that account for 60% of farm sales—livestock, fruits and vegetables, and specialty crops-receive no direct benefits from farm programs. Moreover, about 1.5 million farm units derive only a small fraction, if any, of their income from farming. For 536,000 large commercial farms, income from farming in 1995 averaged \$38,000 for those with sales under \$250,000 and \$303,000 for those with sales above that figure. They receive most of the farm program benefits. Finally, the farm programs hinder the movement of commodities in world markets. These points are well taken and collectively support the need for some kind of reform.

Orden, Paarlberg, and Roe want to get government out of agriculture and assume that the market will yield satisfactory results. They are so confident of this that they do not provide facts, analysis, or speculation about how the market will improve things. If under a market regime more farm sectors go the way of serine and poultry, where industrialized agriculture prevails, will the nation and consumers be better off? Will there be no social costs to pay?

The best two chapters discuss the adoption in 1996 of the Federal Agriculture Improvement and Reform Act, also referred to as FAIR and the Freedom to Farm act. It decoupled benefit payments to producers of export crops—wheat, corn, feed grains, cotton, and rice—from production controls, which were eliminated. Payments to farmers totaling \$36 billion between 1996 and 2002 are based on past production records. It is not surprising that almost all eligible farmers signed up for benefits, which are independent of market prices and require no production cutbacks. If this scheme works, and if benefits end as scheduled in 2000, it represents a partial cash out. Programs for nonexport competing crops, such as sugar and peanuts, remain in place.

FAIR represents the most drastic change in the farm programs since their adoption in the 1930s. The authors cite two factors as critical for its adoption. First, the Republican congressional majorities elected in 1994 were amenable to reform. Second, high farm prices in 1996 would have reduced payments to farmers under existing programs. They would receive more money under Freedom to Farm, which lessened resistance to change.

Orden, Paarlberg, and Roe are somewhat pessimistic about the future of FAIR. Will it be extended to other crops? Low farm prices or a return to Democratic control of Congress, for instance, could reduce the act's appeal and lead to its demise. They make various prognostications about the future of farm policy. The tenuous state of Freedom to Farm is indicated by the 1998 and 1999 congressional bailouts of farmers because of low prices and crop failures. These totaled \$15 billion.

The book does not do as good a job as it might in explaining why farmers have been so successful in getting what they want. The authors remark on a "three-sided nexus (farm lobbyists, congressional agriculture committees, and the USDA) that so often works to perpetuate existing farm programs" (p. 53), which they call the agricultural policy establishment. Its structure and workings are maintained to justify "fully staffed" agriculture committees and a large USDA. The political analysis in the book does not do much to help us understand why Congress adopted the bailout legislation in 1998 and 1999 and is likely to do so again in 2000. Of course, few call this reform.

Even readers who disagree with the perspective of this book will find it a valuable and accessible source of information and insight on agricultural policy and politics. The authors know their subject. Students of public policymaking will find this a solid contribution to the literature. It can, for example, help us understand why policy termination is so difficult and so uncommon. It is a fine example of qualitative policy analysis.

Remaking Chicago: The Political Origins of Urban Industrial Change. By Joel Rast. DeKalb: Northern Illinois University Press, 1999. \$36.00.

Martin Saiz, California State University, Northridge

Joel Rast forcefully challenges those who promote the notion that the policy choices in U.S. cities can be explained with reference to economic and demographic changes caused by a shift from a manufacturing to a service-based, postindustrial economy. Instead, he argues, Chicago's downtown-centered growth strategy was a consequence of an uncontested ideology of urban development informed by contemporary theories of urban political economy. Current models of economic restructuring, according to Rast, depict central cities as obsolete sites for industrial production and point to the adoption of a "corporate-center strategy" focused on the development of downtown office space and supporting land uses that require the replacement of newer-downtown industrial and lower-income residential districts with back office and upper-income housing, as well as the building of hotel, cultural, and sports facilities. Yet, through an examination of Chicago's redevelopment efforts between 1955 and 1997, Rast shows that the rise of advanced corporate services and the corresponding decline of near-downtown industrial districts was not a foregone conclusion. To the contrary, Chicago's transition to a corporate-centered service economy was a product of policies created by an alliance between the Daley machine and key representatives from the downtown business community.

As further proof that Chicago's renewal and gentrification strategies were not products of economic pressure, Rast documents the rise of a viable development alternative. Only relatively large, vertically integrated manufacturers were interested in cheaper land and labor costs on the urban periphery and elsewhere. The small- to medium-sized man-

ufactures engaged in contracting or subcontracting for local or regional markets showed little interest in suburban locations. Through case studies of the printing and garment industries, Rast shows how these firms were spatially rooted—bound to one another through supportive networks and trust—yet were almost completely uprooted by Chicago's redevelopment programs and land use regulations. It was not until lower-income and blue-collar neighborhoods shifted from social protest to neighborhood economic development efforts and forged new relationships with local manufacturers that what Rast calls a "local-producer strategy" began to emerge. This new coalition found sympathy within the Harold Washington administration for the idea of industrial retention and eventually challenged the city's myopic emphasis on downtown redevelopment.

Rast argues that Chicago's efforts to transform its economic base from manufacturing to services were not required to stem the post-World War II tide of central city residential and industrial decline. In an insightful twist of conventional wisdom, he shows that Chicago's downtown revival was successful because city officials could indeed influence the form and trajectory of corporate investment. Yet, these same officials overrated the effects of corporate restructuring, technological innovation, transportation improvements, and regional variations in land and labor costs on near-downtown manufacturers, and they underestimated their ability to protect industrial jobs through land use regulation. Rast boldly argues that politics and policy choice (or the lack thereof), not economics, determine the course of cities.

Even as an advocate of the political economy approach to understanding social behavior in cities, I did not find it difficult to accept the argument that politics and policies shape cities. John Mollenkopf demonstrated almost twenty years ago that local growth coalitions are instrumental in gaining the federal policies (subsidized home mortgages and interstate highways) that lead to the development of American suburbs. The policies of public school integration, mortgage redlining, deed restrictions, and exclusionary zoning help complete the project and prompt center city decline. Although Rast clearly proves his thesis and makes a significant contribution to the field of urban politics, many of his theoretical points are scored against what borders on straw theory. Not even the most dogmatic structural Marxist believes that the economy is completely coercive. Most adherents of urban political economy are more sensitive to the social nature of markets, the pervasive power of growth politics, and the policy consequences of regime change.

Rast freely borrows from political economists John Logan and Harvey Molotch. Their notion of community power structures dominated by a local land-based growth coalition explains much of Chicago's policy behavior, and it is here that Rast makes his most notable theoretical contribution. Refusing to view business monolithically, he expands the notion of use value by showing that Chicago's industrial users develop neighborhoods of informal support similar to those created within residential districts. It is the spatial rootedness of these industrial agglomerations and the possibilities for forming alliances with other groups that value urban land for its use that expands the policy options of cities.

Rast's real concern may be with economic development practitioners, planners, and journalists who give certain credence to the global logic of contemporary urban development. The faithful acceptance of autonomous markets, arrant capital mobility, and the location-driven rationality of firm behavior seem to blind policymakers to the possibilities of an alternative growth strategy. Facile models of global economic

restructuring imply that cities can do very little about their economies, save ride the waves of the postindustrial future and deal with the consequences as best they can. Unfortunately, the development strategies following from these assumptions have led to the replacement of well-paying manufacturing jobs with low-paying service sector occupations and increasing disparity in the distribution of wealth and income. At the same time, public officials, concerned with discouraging mobile investors, are cautious of instituting redistributive policies as a way of reducing class tensions exacerbated by their policy choices. Rast's perceptive analysis showed that a rival growth coalition composed of locally rooted producers, workers, and community-based economic development organizations can support an alternative growth strategy that employs local productive assets and may reduce the very need for redistributive policies.

Reconstructing Times Square: Politics and Culture in Urban Development. By Alexander J. Reichl. Lawrence: University Press of Kansas, 1999. 239p. \$39.95 cloth, \$19.95 paper.

Charles J. Spindler, Auburn University

Since its official creation in 1904, New York City's Times Square has experienced a remarkable rise and fall, constant reinvention, transformation, and rebirth. In this detailed case study, Alexander Reichl documents urban policy directed toward the redevelopment of Times Square between the late 1960s and the late 1990s. The detailed analysis is a valuable contribution to the historically informed study of urban development politics.

The use of symbolism to manage conflict and identify space is a central theme throughout the book. Reichl considers various arenas of conflict: between development interests and neighborhood groups, between the public discourse focused on historic preservation and the arts and the real politics of redevelopment, between the interest of large national and multinational developers and landowners, and between the interest of developers and politicians and the interests of African American and Latino youths. Reichl analyzes symbolism and the symbolic use of space within each of these arenas. For example, he suggests that historic preservation and the arts became symbols used by a progrowth coalition to create public support for redevelopment. Images of Times Square as the Great White Way became symbolic of an idealized past, present, and future and framed public discussion of redevelopment. Low-income African Americans and Latinos were presented as symbols of physical threat in Times Square by the progrowth coalition. Disney's participation in the redevelopment symbolized to the development community both the economic feasibility of investing in Times Square and the security of that investment. To Reichl, Disney's participation also became symbolic of the corporate domination of so-called public space (which Reichl calls "Disneyspace"). Ultimately, Times Square was transformed from a symbolic image of urban decline to a symbol of urban renaissance.

Reichl clearly aligns his analysis with the urban regime model developed by Clarence Stone ("Systemic Power in Community Decision Making: A Restatement of Stratification Theory," American Political Science Review 74 [1980]: 978–90; "Summing Up: Urban Regimes, Development Policy, and Political Arrangements," in Clarence Stone and Harry Sanders, eds., The Politics of Urban Development, 1987, pp. 269–90; Regime Politics: Governing Atlanta, 1946–1988, 1989; and "Urban Regimes and the Capacity to Govern: A

Political Economy Approach," Journal of Urban Affairs 15 [1993]: 1–29). The model emphasizes cooperation between political and economic interests in order to develop electoral coalitions and to govern. The conflict between opposing economic and political interests is resolved through the creation of governing regimes. The model suggests that the local political context frames policy choices, and the governing regime is a primary determinant of policy choices. By contrast, the economic determinism model developed by Paul Peterson in City Limits (1981) emphasizes an economic approach to policy choices. It suggests that larger state and national economic forces impose certain policy choices upon a city. Peterson argues that cities have a unitary interest in promoting economic development.

Reichl focuses on the management of conflict among different economic, cultural, and ethnic interests, which leads him to reject the economic determinism model. He acknowledges that "the overwhelming predominance of support [for redevelopment]...might reasonably approximate the kind of broad-based support for development described by Peterson" (p. 142), but he suggests that this support was politically constructed "by means of a coalition strategy that centered on cultural politics," which recast the political debate in a way "that predisposes higher-income urban residents to support redevelopment" (p. 142). Ultimately, Reichl argues, economic factors alone do not explain the process of postindustrial restructuring experienced by many American cities. "The argument presented here is that political factors play a central causal role in changing patterns of urban redevelopment" (p. 10).

Yet, Reichl presents valuable evidence that supports Peterson's economic determinism model. For example, the economic potential of Times Square was vastly underdeveloped: "No new construction had occurred in the immediate environs of the Forty-second Street project area ... since 1931. Consequently property taxes generated from the area-... were but a fraction of the potential, in fact the total tax revenue was less than that received from a single building a block east at Sixth Avenue" (p. 67). Reichl found that business, civic, and political leaders were convinced that real and perceived problems, such as "crime, drugs, pornography, prostitution and menacing African-American and Latino youths," threatened the "economic and social health of the entire west side of midtown Manhattan" (p. 5). The decline of the city's real estate market in the 1990s was in part the result of the stock market crash of 1987. Reichl's analysis also makes clear that the emergence of a postindustrial economy in New York City widened the gap between rich and poor, which was a factor contributing to the push for redevelopment. The growth of the global economy led to the emergence of the postindustrial economy in New York.

At times Reichl blurs the distinction between political regimes and growth coalitions or growth machines. "I use the term 'pro-growth coalition' and 'pro-growth regime' to refer to the enduring coalition of interests that were unified behind a broader pro-growth agenda for New York City" (p. 190, n. 56). The urban development literature generally differentiates between growth coalition and regime. Both approaches focus on cooperation between public and private elites. In Urban Fortunes, The Political Economy of Place (1987), Logan and Molotch argue that the politics of local economic development are driven by the vested interests of property owners who seek to realize their economic interest through a progrowth coalition. The emphasis of urban regime analysis on cooperation between political and economic interests in order to develop electoral coalitions and to govern.

Reichl calls for some alternative to corporate control of public space through the "theme-park experience" (p. 179). He believes in the "importance of pursuing democracy and authenticity in urban development" (p. 177), "areas of cultural diversity" (p. 181), and "a more enlightened vision for the future of cities" (p. 181). Reichl does not explain how an opportunity-expanding regime is to be created in New York City, how political support for urban diversity is to be achieved, or how opposition is to be overcome.

In Reconstructing Times Square we begin to see some movement toward integrating conflicting urban policy models. It is hoped that Reichl will continue in the work he started.

Just Institutions Matter: The Moral and Political Logic of the Universal Welfare State. By Bo Rothstein. New York: Cambridge University Press, 1998. 254p. \$59.95 cloth. \$19.95 paper.

Max Neiman, University of California, Riverside

Politics is the serious, sometimes grim, contest over the distribution of advantages and disadvantages. Scholars ought to have some interest, therefore, in the important stakes involved in politics. Yet, somehow, many political scientists have made a professional virtue of disguising the important stakes and have abdicated much of the serious discussion about policy effects to branches of economics and to partisans among ideologically contentious think tanks. That is why Bo Rothstein's audacious statement in Just Institutions Matter is so welcome: "My aim in this book is to unite two incompatible ambitions: speculation and discipline" (p. 1). Furthermore, "in contrast to most social scientific research undertaken today, this book is both openly normative and empirical" (p. 1). Of course, although speculation and discipline are different, they are related in critical ways. Often the point of scholarship is to produce disciplined speculation that incites further scholarship. Just Institutions Matter should be a frequently cited work among those interested in comparative politics and policy and the general issue of policy evaluation.

Focusing on the nature of the modern welfare state in advanced societies, Rothstein tries to do what he claims he aspires to do: demonstrate the interplay among values, policy formation, and policy outcomes. He is largely successful, although his accomplishment is mostly in the theoretical and speculative rather than the empirical realm. Nevertheless, his achievements in this book are laudable. His application of Rawls, through the lens of Dworkin's "principle of equal concern," leads to a rights-based foundation for the universal welfare state, an effort that should be of major interest to scholars working on the formal connection between social welfare principles and policy implications. Some might even find the normative analysis curious. After all, the principle of equal concern might slip easily into a kind of Paretooptimization limit on state intervention. Instead, it is interesting to see how Rothstein arrives at the view that equal concern and respect for citizens produce a universal welfare commitment to proved a wide array of public goods and services, he doe this in a sweeping second chapter, "The Universal Welfare State and the Question of Individual Autonomy."

Rothstein generalizes from the Swedish and Scandinavian experience, which is emblematic of his desideratum of the "universal welfare" principle, contrast with the principle of "selective welfare." The two principles are posited as ideal types and coexist in varying mixtures in all states, with one

usually prevailing. Universal programs entitle virtually all people within the society as recipients, whereas selective systems limit programs, often by some needs-based principle. Rothstein argues that in democratically organized welfare state, the interests of the less-well off and the more affluent converge, even in the face of higher taxes, since these are significantly offset by social harmony and greater levels of consumption through public systems of distribution. Apart from issues of effectiveness, the success of such universalistic programs also rests on the legitimacy accorded them by broad segments of empowered and informed citizens who are in a position to assess and act on the outcome of policy.

In contrast, policies based on selective, means-tested principles are far more complicated to formulate (requiring a determination of who is deserving); are complex to implement (requiring policing and regulating to ensure that recipients are qualified); and incite resentment on the part of those who are not "qualified" for benefits. As a consequence, selective welfare programs are perhaps less effective from an implementation view; they also are more subject to political resistance and less likely to be supported, particularly if nonqualifiers are numerous and politically effective, as is the middle-class in the United States. In the United States the principle of program selectivity is raised to another level. Programs are very selective, organized around particular clients, but those for the poor are delivered primarily through direct expenditures, whereas those for the more affluent and powerful are very often delivered through the tax code. The effect is to obscure the extent of welfare support for some and exaggerate and make more vulnerable the benefits provided to the less well-off, or those who do not file the long form.

Rothstein points out that the universalistic principle has been under stress throughout the world, including in Sweden, as a result of fiscal crises, concern over economic stagnation, worries about welfare dependency, increased infatuation with privatization, and the pressures of global competition. Nevertheless, even when retrenchment in large welfare states is required, the universalistic principle can apply. For example, reductions can be shared broadly rather than borne by certain parts of the society. If the housing benefits for the poor are reduced, should we not also reduce the tax benefits of housing for the affluent, which is how they receive housing support? This issue is implicit in Rothstein's analysis, although he does not dwell on the universal principle as applied to program retrenchment.

Although committed to an interventionist state and universalistic principles to guide program design, Rothstein is not a knee-jerk, uncritical supporter of open-ended public sector growth. His overview and reworking of the implementation literature clearly suggest guidelines for when state intervention is more or less likely to succeed. He makes a strong case that adequate knowledge, political support, and appropriate institutional design are needed for policy success. Good intentions should not substitute for verified knowledge about the problems being addressed. Rothstein proceeds to develop an evaluative framework to specify what the state can do, based on considerations of policy design, organizational/institutional setting, and legitimacy. Each is further elaborated to include such matters as policy substance and a variety of different avenues and techniques for establishing policy legitimacy.

The framework developed in the middle chapters permits Rothstein to compare and interpret historically and crossnationally with respect to support for welfare policies. It also permits him to evaluate critically the neoliberal, public choice orientation toward policy evaluation or implementation, although clearly Rothstein accepts certain aspects of the public choice bottom line, such as the need for competitiveness and choice in public sector service delivery.

The main strengths of *Just Institutions Matter* are primarily analytical and theoretical rather than empirical. Rothstein is eloquent in his argument for universalistic principles to guide social welfare policy, and he is very creative and analytically agile in providing a language and framework for connecting values and policy. Still, the strengths of this book, considerable as they are, will have no real effect unless others are incited to equally committed empirical work.

Interest Groups in American Campaigns: The New Face of Electioneering. By Mark J. Rozell and Clyde Wilcox. Washington, DC: CQ Press, 1999. 192p. \$20.95 paper.

Stephen J. Stambough, North Dakota State University

This book is timely, particularly considering the public debates about campaign finance reform and the growing use of interest group money with independent expenditure campaigns. The authors remind us that interest groups do more than just give money to campaigns and explain this behavior with a fairly straightforward argument. They claim that the activities of interest groups can be understood by knowing the opportunity structure in which groups operate and the goals they wish to achieve. The goals and opportunity structure combine to form a strategic context, a concept that Rozell and Wilcox then use to examine interest group interactions with political parties, political candidates, and voters.

In the first substantive chapter, the authors present a good combination of qualitative and simple quantitative analyses. They demonstrate the types of activities of interest groups in different stages of the election process. Three principal areas of interaction between interest groups and political parties are explored: candidate recruitment and training, party rules and platforms, and financing. The role of interest groups in candidate recruitment and training is undoubtedly growing. but more information on the influence of more open primary laws might be in order. The section about party rules and platforms is good but somewhat overstated. Although they discuss Bob Dole's decision to ignore the 1996 Republican Party platform, the authors give the impression that party platforms have a significant effect. A large percentage of the party platform becomes law after an election, but usually the less controversial sections with a strong level of agreement between the party and the interest groups. A better test would be to see the real influence of interest groups in truly reshaping the party's actions when in government, I was particularly impressed with the section about state and local politics, which presents several arguments and suggestions that can lead to significant future research.

The next chapter examines the relationship between interest groups and candidates. At first I was disappointed because it did not tell me anything new, but upon reflection I believe the authors do a very good job of explaining these activities within a well-developed context. They show the work by groups in providing money in all its various forms as well as in-kind services, and they discuss the role of interest groups in developing candidates. The section that outlines how groups give beyond the normal limit is especially instructive.

The final substantive chapter examines the role of interest groups with the voters. Again, the authors do an excellent job of organizing topics and findings; there are no surprises, but they provide a well-developed framework. Too much emphasis is given to the practice of endorsements, which have little effect on the average voter, and not enough is given to the role of interest groups in initiative elections. Direct democracy has become a more attractive avenue for these groups, most obviously because they can appeal directly to voters in a form of venue shopping. If the elevated branches of government are not receptive to an agenda, the group can go straight to the voters. Groups also use initiatives to show support for issues within selected electoral districts (even if the initiative loses at the state level), as a lobbying strategy. Local initiatives and referenda may be even more attractive to interest groups at the local level. More work is needed in this area.

This is a good, comprehensive examination of the changing role of interest groups in American politics. The authors do a fine job of including the effect of technological changes in all the areas discussed. They also explain the values and issues involved in reform proposals. This book is best suited for undergraduate courses and early graduate classes.

Explaining Congressional-Presidential Relations: A Multiple Perspective Approach. By Steven A. Shull and Thomas C. Shaw. Albany: State University of New York Press, 1999. 224p. \$59.50 cloth, \$19.95 paper.

Glen S. Krutz, Arizona State University

Because Congress and the president reside at the vortex of lawmaking in national government, it is vital to understand their interaction. This book examines multiple patterns in their relationship. It covers four discrete behaviors or dependent variables (presidential position-taking, legislative support of presidents' positions, presidents' propensity to veto legislation, and budget agreement between the branches). To explain these behaviors, the book adopts three perspectives or environments: executive, legislative, and exogenous. The result is an impressively complete and balanced approach to the topic. In the spirit of their balanced approach, the authors even alphabetize the order of the two institutions rather than use the conventional "presidential-congressional relations."

The first three chapters set up the subsequent analyses. In chapter 1, Shull and Shaw review the literature and argue that a broader perspective is needed. In particular, they argue for more analysis of policy formulation to join the volumes of research on policy outcomes. They also preview the four interactions analyzed in later chapters: position-taking, legislative support, veto propensity, and budget agreement.

Chapter 2 presents the theoretical framework. Shull and Shaw explain: "We examine political decisions within the context of a multiple perspectives model that encompasses necessary activities and resources as being important to subsequent relations between Congress and presidents" (p. 38). The authors assume that both Congress and the president use available resources and conduct activities to further their policy preferences. To explain variation in the dependent variables, Shull and Shaw use measures of resources and activities from each of the environments: executive, legislative, and exogenous. The executive explanatory variables are the president's public support, the size of the executive office, and speechmaking. For Congress the explanatory variables are size of committee staff, the party margin in Congress, and the volume of legislation. The exogenous category is grounded in David Easton's systems theory (Framework for Political Analysis, 1965). The authors expect that forces outside the institutions influence presidential-congressional

relations. They use a deficit/spending index and the size of government to tap into this third environment. They also control for policy type (domestic versus foreign) and political time.

Chapter 3 describes the measures and methods used for the subsequent analyses. All the models are aggregated by year. On presidential position-taking, for example, Shull and Shaw examine variation in the number of positions taken by presidents per year from 1949 to 1995. They do not examine why presidents stake out a position on some bills and not on others.

Chapters 4-7 analyze, in turn, the four interbranch behaviors. In chapter 4, the authors tackle presidential positiontaking. They show that it is increasing over time and that unpopular presidents stake out more positions. A larger party margin also leads to more presidential positions. In chapter 5, Shull and Shaw examine legislative support for presidents, which is decreasing. The support model (the strongest of the four) suggests a variety of explanations, most notably the economic situation and party margin. These findings make sense because deficits and divided government are more common in recent times, the period of the decline in support. Chapters 6 and 7 examine veto propensity and budget agreement, both of which exhibit more volatile trends than the other two behaviors. Veto propensity appears driven by party margin and popular approval. The model of budget agreement (the weakest of the four) suggests that popular presidents agree more with Congress.

This is a strong book in certain respects. First, it is thorough and empirically impressive. As the author repeat throughout the book, most other scholars in the field (myself included) test their models on one type of behavior at a time (e.g., legislative roll-call outcomes or confirmation choices). Shull and Shaw analyze four different behaviors with many explanations.

A second major strength is the multivariate analysis employed to explain each of the four behaviors. A helpful methodological appendix answers many of the questions one might pose about the quantitative analysis. This technique improves on the bivariate analyses that Shull used (and many criticized) in his otherwise well-received *Presidential-Congressional Relations: Policy and Time Approaches* (1997). The analysis demonstrates that the same factors that drive behavior at the policy outcome stage do not apply wholesale to other behaviors. This is a significant finding that could have alternatively found its way into a major scholarly journal.

The effort to be complete, however, comes at a cost. Beyond the point of being thorough, the book lacks a clear argument or theory. To illustrate: "The primary thesis is that [congressional-presidential] behaviors are constrained by environments such that neither presidents nor Congress dominate any of the four types of interaction. As we have asserted, influences on each activity are complex" (p. 2). To paraphrase, lots of things explain lots of things. Hence, readers who desire a crisp theoretical hook will not find one in this book. Simply put, Shull and Shaw advance our empirical understanding of presidential-congressional relations more than our theoretical understanding.

A second shortcoming is the operationalization of policy environment, which is an important component of all four models. The authors choose to employ only a dichotomy between foreign and domestic policy. The empirical analysis would be strengthened by observing as well how the phenomena vary across more clearly delineated policy areas, perhaps using the various policy categories employed in Shull's 1997 book.

Despite these shortcomings, scholars of Congress and the

presidency will no doubt find the book valuable. I plan to adapt many of the explanations offered by Shull and Shaw into my own research. I also look forward to further work from these authors; there are many more questions that

could be answered with their impressive evidence. All in all, Shull and Shaw should be commended for moving forward the scholarly literature on presidential-congressional relations.

Comparative Politics

Greener Pastures: Politics, Markets, and Community among a Migrant Pastoral People. By Arun Agrawal. Durham, NC: Duke University Press, 1999. 219p. \$49.95 cloth, \$17.95 paper.

David B. H. Denoon, New York University

This intriguing volume uses rational choice theory at the intersection of political science, anthropology, and sociology to explain the behavior of the Raika shepherds in western India. Why should this matter to political scientists? First, the book is an impressive and clearly written monograph that addresses important topics in the field and demonstrates the insight that can be drawn from a consistent theoretical approach. Second, by providing a comprehensive analysis of the shepherds' behavior, Agrawal shows the advantages of interdisciplinary work. Third, by explaining the choices of migratory groups, Agrawal gives us a window on developments in other parts of the world (central Asia, western China, Laos and Burma, and sub-Saharan Africa), where yearly—not permanent—migrants have important political consequences.

Agrawal focuses on two main questions: Why do the Raikas migrate? Why do they migrate in large groups? In the process of answering these questions, he presents useful generalizations on three related topics: hierarchy, bargaining, and political economy.

Why do the Raikas migrate? Agrawal presents a convincing case that the Raikas move annually because they can increase their real incomes substantially above the level they could plausibly attain if they were sedentary within their home villages. Agrawal concentrates on the village of Patawal (near Jodhpur in Rajasthan) but shows that the behavior of the migrants he observes is similar to that of others throughout western India. Raikas are a lower caste who pursue one of the world's oldest occupations, but they are neither destitute nor at the bottom of the social hierarchy. Raikas own mostly sheep and goats, and in Patawal they have more than 6,000 animals in their flocks.

The Raikas' dilemma comes from their inability to form political coalitions within their home village. If they could get the untouchables and scheduled castes to vote with them, they could gain access to more of the village grazing lands set aside for cattle owned by the upper castes. The Raikas are unsuccessful at forming political coalitions with other lower castes because those below them are so poor and vulnerable that they are unwilling to risk alienating the village's higher status groups. Annual migration solves two problems: it provides fodder for the animals during the dry season, and extra income is earned because farmers are willing to pay for the fertilizer left by the flock.

Why migrate in large groups? The size of the migratory group is determined by both economic and political factors. There are scale economies in shepherding. One agent can negotiate with farmers to have the sheep and goats graze down a field just before planting, and a large flock can predictably cover a defined area in an overnight stay. Also, politically, there is safety in numbers, as the Raikas can assign one leader to pay the appropriate bribes to local police and

government officials as they cross others' terrain. Small groups could more easily be expropriated and intimidated.

What does this tell those of us who do not follow India or the issue of migration? Regarding hierarchy, Agrawal has made a significant advance over Charlotte Wiser's Behind Mud Walls (1971) by showing that neither numbers of voters nor assets are adequate to elevate the Raikas' interests in Patawal. Greener Pastures also provides a more complex explanation of rural poverty than such classic Marxist views as Franz Fanon's The Wretched of the Earth (1963). Hence, in sophistication, Agrawal's work is closer to Pranab Bardhan's "Analytics of the Institutions of Informal Cooperation in Rural Development," World Development 21 (1983): 633-9.

Elaborate bargaining is the centerpiece of Greener Pastures and illustrates that the Raika shepherds are far from operating in a world of pure oppression. In fact, they are involved in frequent bargaining: deciding who should represent them to the outside world, determining how to ward off financial predators, and making group decisions about the prices and quantities of the wool and animals they sell. Since dealing in quantity is an advantage, selecting a clever agent is critical and much debated among the Raikas. Therefore, Agrawal's findings fit nicely into current microeconomic and gametheoretic views of agency and human behavior (e.g., Eugene E. Fama, "Agency Problems and the Theory of the Firm," Journal of Political Economy 88 [1980]: 288-307). Sadly, the Raikas' experience also confirms long-held views about corruption in India, previously analyzed in J. Jagdish Bhagwati and T. N. Srinivasan, India, 1975. The Raikas understand, however, that pay-offs vary with the power and venality of the official, and they develop an intricate set of guidelines for dealing with extortion.

Agrawal has two principal contributions of interest for political economy. He strongly endorses the view of peasants as rational calculators of their own interests (see Samuel Popkin, *The Rational Peasant*, 1979), and he makes a clear distinction between annual migrants, who stay within their home social hierarchy, and permanent migrants, who take greater risks and seek greater rewards (see Oscar Handlin, *The Uprooted*, 1973).

In sum, *Greener Pastures* nicely illustrates how a consistent theoretical approach links many different types of complex behavior. It will be essential reading for specialists on India and rural development, but it is accessible and of interest to a very broad audience.

India against Itself: Assam and the Politics of Nationality. By Sanjib Baruah. Philadelphia: University of Pennsylvania Press, 1999. 257p. \$36.50.

Democracy and the State: Welfare, Secularism, and Development in Contemporary India. By Niraja Gopal Jayal. New Delhi: Oxford University Press, 1999. 289p. \$32.00.

Development and Democracy in India. By Shalendra D. Sharma. Boulder, CO: Lynne Reiner, 1999. 281p. \$55.00.

Sikata Banerjee, University of Lethbridge

All three books stem from a general concern with India's inability to live up to Nehru's promise of a better life for Indians symbolized by his famous "Tryst with Destiny"

speech delivered in 1947 on the eve of independence. The underlying implication of these books is not only that this promise has not been fulfilled but also that the Indian state has been plagued by misguided policymaking, indecisiveness, and a lack of a political will to tackle important problems. The authors' articulate this general concern by focusing on three specific aspects of the Indian polity: the robustness of democracy and citizenship (Jayal), rural poverty (Sharma), and subnationalist challenges to Indian federalism (Baruah).

Niraja Gopal Jayal states: "Citizenship indeed lies at the heart of democracy and has been posited here as its very test" (p. 249). She concludes: "A fundamental shortcoming of Indian democracy is its inauthenticity and unrepresentativeness" (p. 255). By using extremely detailed empirical data on the politics surrounding a famine in the state of Orissa, the issues informing the Muslim Women (Protection of Rights on Divorce) Act of 1986, and the political furor surrounding the Narmada Valley Dam projects, the author makes a compelling case for the Indian state's failure to provide social conditions that enable the "effective exercise of citizenship," by which she means the ability of ordinary folk to interrogate and modify state policy through democratic procedures such as civil disobedience to create a more equitable society.

Each of the three cases illustrates the failure of citizenship in India. In the Orissa case, famine victims' inability to influence state policy delayed emergency aid; in the Divorce Act case the voice and rights of female citizens were overcome by a vocal and powerful male minority feared by the state; and in the Narmada Valley episode the voices of almost a million citizens who would be displaced by the proposed dam were only heard because of the intervention of certain elites on their behalf.

The strength of Jayal's book lies in its amassing of empirical detail. Indeed, given that the chapters on Orissa and Narmada Valley are, respectively, 70 and 85 pages long, some of this detail might well have been edited without detracting from the major arguments. The theoretical chapter also would have benefited from editing. The author does a good job of synthesizing the "state-society" literature, discussing its relevance to India, and applying observations drawn from works by Joel Migdal (Strong Societies and Weak States, 1988), Atul Kohli (The State and Poverty in India, 1987), Bertell Ollman ("Going Beyond the State," American Political Science Review 86 [December 1992]: 1014-7), Adam Pzerworksi (Sustainable Democracy, 1995), and Theda Skocpol ("Bringing the State Back," in Peter Evans et al., eds., Bringing the State Back In, 1985). Some of this theoretical discussion may not have been necessary, since Jayal is not arguing for significant reorientation of political analysis introduced by

Jayal's major argument is that the project of democracy cannot be successful unless most citizens of a state, no matter how disadvantaged, can exercise their rights to limit state power and hold it accountable. Indeed, given this standard, Indian democracy has failed. It seems to me that such a lengthy discussion of the "state-society" literature was not needed to precede such a conclusion. Furthermore, there is no significant theorizing of the author's own except for the observation that the Indian state has failed to provide conditions for most citizens to exercise their voice in the polity. Yet, since in the tradition of Thomas Kuhn (The Structure of Scientific Revolution, 1962) most of us are normal scientists within a given theoretical perspective, this is not necessarily a problem. Jayal's contribution lies in the empirical detail of her work, which buttresses her compelling critique of the limits of citizenship in India, but the study would have been more provocative if Jayal had in her conclusions discussed some ways in which it would be possible to overcome these limits.

Sharma also begins his analysis with a discussion of the state-society approach, but his is more to the point, as it situates the Indian state within this debate as a "weak-strong state" that has been unable to solve rural poverty for several reasons: Policy was implemented in a piecemeal fashion, institutional structures of administration were weak, and "structures are easily penetrated by organized and powerful social and clientelistic forces that then confine the state to operating within an ever narrowing range of choices" (p. 88). This statement both underlines Sharma's rejection of the minimal state intervention, neoliberal solution to poverty for an approach that relies on innovative state intervention in the style of the East Asian states and locates this work in the tradition of Joel Migdal (Strong Societies and Weak States, 1988). Migdal argues that state policies are substantially altered when resources are hijacked by local strongmen. In Sharma's analysis, these are "rural elites" who have "limited the range of options available to the Indian state to institute even mild reformist and distributive policies" (p. 120).

Sharma's contribution lies in his detailed discussion of these elites, who have emerged as a result of what he terms the "politics of new agrarianism," which is based on the activism of middle-sized and/or large peasants who have been enriched by the green revolution and nascent agrarian capitalism. Although they claim to speak for village India, in actuality they promote and defend "landed" interests and do not represent the landless and the marginal farmer. Sharma argues that the state can resist the rural elite's ability to distort distributive policy by strengthening administrative structures in India. He buttresses his proposed solution by comparing India's dismal record in dealing with rural poverty with the new Chilean democracy's success in promoting human development and social programs. He explains Chile's success by pointing to the absence of strongmen like the new rural elites and the presence of strong/disciplined administrative institutions, which India lacks. Like Jayal, Sharma does not produce much theoretical reorientation, but his effective explanation for why the Indian state has failed in its distributive function is supported by original empirical work and an intriguing comparison with Chile.

As in the other two studies, the point of departure for Baruah is also the Indian state, more specifically its implication within subnationalist politics. He uses the emergence of subnationalist politics in the northeastern Indian state of Assam to argue that (1) Indian federalism is very weak because politicians view any sharing of power with regions as an attack on the integrity of India and (2) the constitutional framework of India makes it remarkably easy for the union government to override regional authority. These two factors exacerbated the situation in Assam and facilitated much of the violence there.

Furthermore, Baruah reveals the spiral of oppression hidden in the political desire to construct an ethnically and/or linguistically homogeneous national or subnational community in a multinational context. In other words, such Assamese groups as the United Liberation Front of Assam refuse to admit that although they may make a compelling case for "oppression" when faced with the pan-Indian totalizing vision of the union government, other marginalized groups in this state, such as the Bodos, may offer similar arguments when confronted with the exclusionary and assimilative tendencies of Assamese subnationalism. In order to move away from such endless suspicion, Baruah argues, a renewed federalism based on the Canadian model of charter federal-

ism is needed, "which combines autonomy for states with a strong regime of individual and group rights" (p. 206).

Baruah's point is well taken, but as a citizen of Canada I am not so optimistic about this solution. Canada's federalism has not solved the problem of Quebec subnationalism. A federal government more than willing to negotiate with the province has given it administrative control over immigration, cultural/linguistic policy, and economic development (the three areas crucial to the Assamese subnationalist debate). Yet, the calls for Quebec sovereignty remain, and the Canadian federal government is still viewed by Quebec nationalists as the oppressor. True, Quebec subnationalism has not led to the type of violence Baruah finds in Assam, but it is hard to argue that Canadian federalism rather than other factors—such as a small population (30 million), a lack of economic desperation, the history of being a British settler colony with cordial relations with the empire, and a political tradition that attempts to circumvent confrontation—has prevented this violence.

None of the authors end their study with an optimistic view of the future. Sharma and Baruah do try to provide options that the Indian state may wish to pursue in order to ameliorate rural poverty and renew federalism. Jayal does not attempt to discuss how, given her analysis of the limits of citizenship in India, it would be possible to rejuvenate effective democratic participation, but such an analysis should spawn further study of the issue. In the final analysis, only vigorous citizen participation can facilitate the solutions offered by Sharma and Baruah.

Social Movements and Political Reform in Hong Kong. By Linda Butenhoff. Westport, CT: Praeger, 1999. 134p. \$55.00.

James C. Haiung, New York University

This is an unusual study of the activism of social movements in Hong Kong. Both in the book and in the publisher's blurb announcing its publication, the author is portrayed as presenting an antithesis to the usual claim of "political apathy" in Hong Kong under colonial rule. Using three case studies, Butenhoff endeavors to show how social movements influenced the process of political reform.

The three case studies are the independent labor movement, the nontraditional Christian movement, and the democracy movement, which are analyzed within a social-movement framework. There are introductory and concluding chapters, one chapter each on the three case studies, and two chapters (chaps. 2 and 3) that sketch the background of the social movements and the structural (or political-governmental) parameters within which they emerged.

Butenhoff maintains that Hong Kong during the colonial era did have a "civil society," albeit characterized by elite consultation and indirect participation, in the absence of democracy. This claim is imaginative if not in all cases convincing. The success or failure of her attempt to disprove the apathy thesis turns on her ability to demonstrate the existence of a civil society, as such, which in turn hinges on whether she can prove the necessary links between social-movement activism and political reform.

Only the independent labor movement (the first case study) has historical roots and precursors before 1984, the demarcating line, when the Sino-British joint declaration announced Hong Kong's reversion to China in 1997. In the other two case studies, activism occurred only after 1984 and throughout the 1990s. Butenhoff could have demonstrated a

civil society before 1984 only in chapter 4, on Hong Kong's labor movement, but although she cites instances of labor strikes and unrest going back to the 1920s, she shows no evidence linking labor demands with political reform by the colonial government in response.

Parts of the book provide evidence that some inputs from the public were made during the drafting of the Basic Law, the miniconstitution of the future Hong Kong special administrative region (SAR). References are made to the "activities" of the independent labor movement during the drafting process (p. 48) and to the "involvement in politics" of the Christian churches (p. 80), but the more detailed discussion of political participation are reserved for the democracy movement (chap. 6).

Chapter 3 notes an ensemble of inputs from the public that were juxtaposed to the original British and Chinese proposals (pp. 36, 38–9), punctuating the long debates in the drafting process of the Basic Law (July 1985 through February 1990). But the author does not show that these inputs came from the social movements, as distinct from the wide range of Hong Kong notables who either served on the Basic Law Drafting Committee or were consulted by Beijing.

Even assuming that inputs from the social movements influenced the Basic Law, there is no evidence of a link to political reforms, unless, of course, the making of inputs itself is considered a political reform. If anything, the fact that the public—including those consulted by the Beijing-appointed Drafting Committee, which consisted of 23 Hong Kong residents in the total membership of 59—was invited to participate is more an indication of Beijing's patronage (from the top down), as well as a change in British attitude about public participation after 1984, than of civil society pressures (from the bottom up).

Even if political reform is loosely defined to include influences by Hong Kong residents on the Basic Law and British efforts after 1984 to protect human rights in the colony, one has to give due credit to two extraneous sources. These are British initiative and the 1989 Tiananmen tragedy. The latter steeled the determination of some groups, such as the Christian churches, to seek guarantees for their freedoms after 1997, such as freedom of worship (p. 78). Equally, it galvanized the British to make changes, such as enacting the long-missing Bill of Rights Ordinance (1991) and amending the Societies Ordinance and the Public Order Ordinance, which removed curbs on the right to assemble and restricted the vast (at times arbitrary) power of the local police. The primogenitors of reform were the last two British governors, most especially Chris Patten, who arrived in 1992. The ultimate purpose of the belated British effort to democratize on the eve of their departure was not political reform for its own sake (i.e., to rectify past neglect) but to cushion the Hong Kong people against possible encroachments after the Chinese takeover (see David Chang and Richard Chuang, Politics of Hong Kong's Reversion to China, 1998). If this is the political reform to which Butenhoff's title refers, it was not exactly due to the activism of social movements.

One aim of the book is to gauge how social movements are likely to fare in the new environment. This proves too ambitious an undertaking, as her interviews ended in July 1996. Generalizing from the Chinese disputes with Governor Patten in the early 1990s to the installation of a provisional legislature in 1996, Butenhoff concludes that the civil society she studied "is being dismantled" (p. 105). Events following the completion of her manuscript, including the inauguration of a legislature duly elected in May 1998, have proven her conclusion premature at best.

To sum up, the data presented do not refute the thesis of

political apathy in Hong Kong. The author does not demonstrate the existence of a civil society except during the unrepresentative period of the late 1980s through 1990s. Today, a common problem besetting all political parties in Hong Kong is that those under age 30 are not interested in politics, much less in joining political parties (James C. Hsiung, Hong Kong the Super Paradox, 2000, p. 340). The prevalence of political apathy is unmistakable. The question is not whether a civil society is being dismantled but whether it ever existed. Although the book reads like a Ph.D. dissertation, it provides an interesting theoretical framework that merits the attention of anyone interested in pursuing the study of social movements.

Subnational Politics and Democratization in Mexico. Edited by Wayne A. Cornelius, Todd A. Eisenstadt, and Jane Hindley. La Jolla: Center for U.S.-Mexican Studies, University of California, San Diego, 1999. 369p. \$69.95 cloth, \$25.00 paper.

Edward J. Williams, University of Arizona

Treatments of subnational politics in Mexico and other Latin American countries have been tardy in coming, but the recent literature is heartening. Spurred by the contemporary fashion for political devolution in the affairs of government, scholars have begun to get to this long-forgotten dimension of Latin American politics. Subnational Politics and Democratization in Mexico is a valuable contribution to that emerging literature.

The book contains an introductory essay and 14 selections divided into three parts. The section topics are subnational party organizations and democratization, popular movements and democratization, and the implications of centerperiphery conflicts for democratization. Popular movements receive rather more attention than the other two foci, and indigenous movements predominate.

The volume evolves from a four-year project by a core group of researchers in residence at the Center for U.S.-Mexican Studies, University of California, San Diego. A workshop was convened in Mexico City at midstudy to critique the first drafts.

As are all such enterprises, the result is a mixed product. On the positive side, scholars must welcome whatever they find on subnational groups in a time when their competence is burgeoning. The "damnificados" of the Federal District, the Navista movement of San Luis Potosí, the PANistas of Baja California (and elsewhere), the COCEI in Juchitán, and the Barzón in several parts of the Republic define extraordinarily significant contributions to the evolution of participatory democracy in Mexico. Their inclusion in the volume is, of course, predictable but also quite valuable.

In a somewhat different guise, the introductory chapter, by Wayne Cornelius, also strikes a valuable chord in reminding that devolution contains a mixed message for advocates of authentic democratic participation. The despotic cacique tradition lives on in Mexico, and well-meaning constitutional "reforms" frequently buttress and reinforce parochial tyrants rather than liberate local democrats. The ham-fisted Rubén Figueroas of this world are a long way from idealized Jeffersonian democrats. To make matters worse, narcopolitics adds a special contribution to the forces of state-level tyranny, as the experience of Quintana Roo exemplifies. The devolution of political authority is a double-edged sword wont to suppress as well as liberate.

That theme also forms the focus for a splendid chapter by Richard Snyder, the best of the lot. Beyond political devolution, Synder fastens upon socioeconomic neoliberal "reforms" as making significant contributions to local political authoritarianism. The national deregulation and state-level reregulation of the coffee industry provided an opportunity for authoritarian state governors to strengthen their grip through the imposition of neocorporatist mechanisms and the cultivation of crony capitalism on the state level.

The chapter by Gabriel Torres on the Barzón debtors' movement is a trifle dated and a little loose, but it is chock full of useful insights into the bewildering divisions, contradictions, redefinitions, and coalitions of the several currents and extrapolations of the movement. The Barzonistas form the most potent of the contemporary social movements. Their story has yet to be definitively told, but Torres makes a useful contribution to the literature.

The four chapters on the role of indigenous communities, customs, and traditions in Chiapas, Guerrero, and Oaxaca seem a little too much of an admittedly good thing. To be sure, the indigenous reality defines an important element in the evolving panorama of subnational government in Mexico—and beyond. The aborted San Andres Accords in Chiapas exemplify how indigenous traditions promise to contribute to the parameters of newly defined subnational institutions and processes.

Yet, other regions of Mexico have been significantly more influential in the movement toward decentralization and devolution. For example, the collection makes the occasional bow to Chihuahua, but there is no comprehensive analysis of its contribution to contemporary devolution in Mexico. The case of Jalisco may be a trifle less compelling than Chihuahua, but it is certainly significant in understanding subnational politics and democratization in Mexico. In truth, Mexico's northern and west-central regions have been far more important than the South in the politics of devolution, no matter how theoretically evocative (and romantic) the message of the indigenous South may appear.

The volume also does not offer any measurable analysis of exogenous influences. How soon we forget our dependencista lessons! The North American Free Trade Agreement specifically and the relationship with the United States more generally nudged both presidents Carlos Salinas and Ernesto Zedillo toward the devolutionary option (albeit, in different modes). The Central American conflagration and Mexican decision makers' fears of the contagion wafting north helps explain Mexico City's policies vis-à-vis the southern part of the country. Public and private international bankers urged Mexico to embrace neoliberalism, the economic handmaiden of political devolution.

Finally, in the calculation of positives and negatives, the book boasts a splendid list of acronyms, but it has no index. A list of acronyms is quite useful, but an index is an indispensable attribute of a good scholarly book. The volume is good enough; we should be pleased with it, but it could be much better.

The Logic of Japanese Politics: Leaders, Institutions, and the Limits of Change. By Gerald L. Curtis. New York: Columbia University Press, 1999. 303p. \$27.95.

Regime Shift: Comparative Dynamics of the Japanese Political Economy. By T. J. Pempel. Ithaca, NY: Cornell University Press, 1998. 263p. \$65.00.

Leonard J. Schoppa, University of Virginia

The 1990s were a tumultuous decade for Japan. After four decades of steady economic growth and stable one-party rule by the Liberal Democratic Party (LDP), the economy slowed

to a crawl, and politics went through a series of surprising twists and turns. The LDP split in summer 1993, which allowed the break-away groups to join a coalition of opposition parties that pushed the LDP out of power for the first time since 1955. After staying together long enough to pass electoral reforms, however, the coalition broke up in spring 1994, which opened the door for the LDP to come back into power together with its long-standing arch-rival, the Socialist Party. The LDP did well in the first election held under the new electoral rules in 1996, but it has struggled ever since to maintain its grip on political power in the face of a continuous stream of bad economic news and politics that are much more fluid than in earlier decades.

These books by T. J. Pempel and Gerald Curtis, both of whom are leading Japan specialists in political science, are extremely readable efforts to make sense of these developments. Pempel emphasizes how much change has taken place and argues that the developments of the past decade can be seen as part of a "regime shift" under way since the 1960s. Curtis stresses the "limits of change," as stated in the title. Nevertheless, both books offer arguments with enough nuance (perhaps too much) to account for the mix of change and continuity seen over the last ten years.

Regime Shift argues that the transformation going on in Japan is an example of changes that have taken place at the "middle level" of politics and economics in all the advanced industrialized nations in response to changes in their socioeconomic demography and international environments. At various times in the past, Pempel argues, all these nations developed "regimes"—defined as mutually reinforcing combinations of socioeconomic alliances, political-economic institutions, and public policy profiles—that were suited to the demographic and international circumstances of their day. Because various features of these regimes supported one another, they tended to be quite durable and in many cases lasted for decades. In all these countries, however, trends such as declines in the agricultural share of the economy and rising levels of capital mobility eventually led to tensions among various elements that have produced periodic sharp shifts to new "equilibrium points," where the three elements are once again in harmony. Japan, he argues, is currently going through one of those shifts.

The first half of *Regime Shift* describes how the old regime in place in Japan in the 1960s constituted a mutually reinforcing system that was distinct in important respects from the regimes that grew up in other advanced industrialized societies. After providing brief sketches of the regimes in Sweden, the United States, Britain, and Italy, Pempel shows how the old Japanese regime differed from these: It was based on a social coalition of big business, small business, and agriculture; featured a one-party dominant political system; and pursued a policy of "embedded mercantilism" that propelled Japan's rapid climb up the product cycle through a combination of protectionism and industrial policy while circulating some of the nation's economic gains to inefficient sectors, such as agriculture. This description will be familiar, of course, to many readers.

More novel is the second section of Pempel's book, which describes a thirty-year transition (still under way) from the regime of the 1960s to a new and as yet unformed equilibrium. As have other advanced nations, Pempel argues, Japan has experienced changes in socioeconomic demography and the international economic environment that have put its social coalition under stress and limited its ability to continue the old policy line. In his telling, two forces seem to be most responsible for undermining the stability of the old system. First, agriculture and small business have shrunk to such an

extent, relative to the rest of the Japanese economy, that they can no longer supply the LDP with the votes it needs to stay in power. This forces the LDP to rely on the votes of urban salaried voters, who often prefer policies at odds with those needed to keep the party's traditional supporters happy. Second, growing foreign investment and reliance on foreign markets have led the interests of the export-oriented segment of Japanese industry to diverge from those of import-competing sectors, which strains the LDP's ability to keep both sides happy.

Pempel is convincing in his depiction of the growing stresses in the LDP's support coalition, but he ultimately has difficulty linking these developments to the specific events of the 1990s described at the outset of this review. The problem is that he seems stymied by the contradictory evidence as to exactly how much Japan has changed. For example, he is impressed enough by the evidence of change to describe the nation as having made a "sharp break" from its old policy of embedded mercantilism during the 1990s (p. 146), but just a few pages later he reports data showing how levels of foreign investment in Japan and the share of manufactured imports coming from non-Japanese firms remain distinctly low, to the point that "the old wine of mercantilism filled much of the new wine of internationalism" (p. 149). Similarly, he states at one point that the old regime "collapsed" in 1993 (p. 197) but later admits that political forces advocating reform have yet to establish an effective electoral vehicle for their cause. Consequently, Pempel is able to imagine a scenario for the future in which the current "muddied mix," despite the tensions within the regime, is able to survive for quite some time. One wonders how much analytical leverage can be gained from Pempel's concept if "regimes" are able to survive transitional periods of thirty to forty years in which their elements are in growing tension.

Curtis is less ambitious in that he does not attempt to advance the case for employing a new analytical concept in order to understand what is happening in Japanese politics. His aim is simply to show how formal and informal institutions, as well as the quirks of individual leaders, have constrained the pace and direction of the changes seen during the 1990s. In advancing this claim, Curtis challenges the new generation of political scientists (including his own student Frances Rosenbluth) who have advanced rational choice accounts of Japanese politics. He argues that these scholars, in assuming that all politicians are motivated by nothing more than reelection and that this single concern predictably limits their options, "miss most of what is interesting, and important, about politics" (p. 3). Curtis claims that politicians are complex individuals with mixed motives who frequently have many choices about how to act in a given situation. Their environment, especially institutions, constrain their behavior and point them in certain directions, but they are frequently able to "maneuver to exploit opportunities" (p. 4) in ways simple rational choice models cannot capture.

Curtis is careful, however, to make it clear that just because he challenges rational choice models does not mean he is a culturalist, and he devotes seven pages to making sure that no one misunderstands his position. What interests him are the unique personalities, motivations, and talents of specific individuals, whose choices at key moments have shaped the twists and turns of Japanese politics in the 1990s. Setting up rational choice and culturalist arguments as his foil in this way allows Curtis to regale us with story after story of the infighting and intrigue behind the scenes in Nagatacho and Kasumigaseki (the political and bureaucratic districts of Tokyo) to show how complex individuals shaped political

developments. Curtis had unparalleled access to leading politicians, including the numerous former prime ministers whose interviews are cited in the footnotes, and he offers fascinating blow-by-blow accounts of the LDP's split m 1993, the maneuvering that led to the Hosokawa coalition cabinet that same year, the electoral reform of 1994, and specific policy decisions. In each case, he argues, quirks of the individuals involved, such as personal rivalries among faction leaders, led to outcomes that are difficult to characterize as "rational." Politicians were frequently so focused on short-term "tactics" that they failed to pursue their long-term strategic interests (p. 156).

Although Curtis emphasizes personalities, he recognizes the important role played by institutions in constraining political behavior. He devotes a segment of one chapter, for example, to detailing the little-known rules of Diet procedure that encourage small parties to join together in larger parliamentary caucuses (*innai kaiha*), and he shows how this led politicians to make key decisions that split the anti-LDP coalition in spring 1994. As this example suggests, Curtis is sympathetic to the rational choice argument that institutions create incentives.

In the end, therefore, Curtis's perspective on Japanese politics is probably not as far removed from those of the younger generation as Curtis thinks. He sees enough incentives operating in Japanese politics to use the word "logic" in the title of his book. At the same time, most rational choice scholars are sensitive enough to the complexity of the real world to recognize that few incentives are strong enough to leave politicians with just one choice. They should take Curtis's book as a challenge to begin addressing political situations in which mixed motives and tensions between short-term and long-term incentives create room for political actors to take advantage of their "agency" and make a difference in the world.

The Stable Minority: Civilian Rule in Africa, 1960-1990. By Samuel Decalo. Gainesville, FL: Academic Press, 1998. 344p. \$47.50.

Yomi Durotoye, Wake Forest University

When in 1990 the Beninois inaugurated a revival of electoral democracy in Africa, many observers proclaimed the beginning of the end of both civilian and military dictatorships in the continent, but reversals in Nigeria (1993), the Gambia (1994), Niger (1996), Republic of the Congo (1997), and Cote d'Ivoire (1999), among others, have dampened optimism that the military, in particular, are retreating to their barracks under the onslaught of electoral democracy. At this juncture, the pressing question for many is what Africa needs to do to avoid taking two steps back toward military dictatorship for each step it takes forward toward democracy. Stable Minority, which sets out to examine "the features and policies of civilian leaders and the strategies [that] bond military leaders to postures supportive of civilian rule" (p. 4), offers hope for an answer to this puzzle. Those familiar with the work of Decalo know that he is a significant contributor to the study of civil-military relations in Africa (e.g., Coups and Army Rule in Africa, 1976). Therefore, no one can argue with his proposition that the lacuna in the study of civilmilitary stability (rather than civil-military instability) needs to be addressed. The first paragraph of the opening chapter as well as the title of the final chapter signify that Decalo recognizes that the survival of democracy in the continent is at stake. Thus, one quickly begins to expect Stable Minority to contribute significantly to both civil-military and democratization studies.

The five chapters can be usefully divided into three parts. Chapter 1 develops a theory of civil-military stability. Chapters 2, 3, and 4 are case studies of three of the dozen African countries that in 1990 had never experienced military rule. The final chapter assesses the factors that initiated and currently challenge the redemocratization process in the continent. I agree with Decalo that because the "stable minority" of twelve countries has very little in common, a "search for systemic conditions that act as causes of stability is a false trail" (p. 17). It also validates Decalo's methodological preference for focusing on discrete control policies and strategies. This approach justifiably undermines the persistent tendency to assume that Africans and African countries respond alike to common afflictions.

Decalo's major finding is that the only effective method of subordinating the military to civilian authority in Africa is to neutralize the security forces. Of course, there are many strategies for achieving this control, and Decalo identifies three. The first, the external guarantor modality, speaks to "the existence of external guarantees of military assistance in case of domestic upheavals" (p. 30). Until 1990, France was the only country that assumed such responsibility in Africa, based on bilateral defense agreements signed at independence with its colonies. The agreements were given teeth by, among others, the presence of thousands of French troops in several bases in Africa, a rapid deployment force of 40,000 in Provence for use in Africa, and an oft-demonstrated muscular will to intervene on behalf of clients. Cameroon, Cote D'Ivoire, Senegal, Swaziland, Tanzania, and Gabon are said to rely on this strategy to secure civilian-military stability. The problem is that it is really not an African but a French strategy. Indeed, the end of the Cold War has removed the slight African agency inherent in the modality. To illustrate, while holding out in the French barracks, President Bedie of Cote D'Ivoire lost power to General Guei in a 1999 coup. It was simply not his call to make. Nevertheless, it is ironic that of the three modalities Decalo identifies, the external guarantor is the only testable and sustainable strategy. The efficacy of the other two is impossible to test a priori.

The second broad strategy is the trade-off modality, which "rests on a tacit but visible trade-off of material benefits (to the military as a corporate body, and to officers as individuals) in exchange for political fealty" (p. 36). Decalo admits that although this strategy is theoretically less reliable and stable than the external guarantor modality, it has proven somewhat effective in Kenya and Zambia. As a testimony to its unreliability, attempted coups and conspiracies by the military in Kenya occurred in 1964, 1971, 1978, and 1982 (pp. 237–46). Furthermore, this strategy, which is widely used in the continent by both the civilian and military governments, has in most cases failed to serve the practitioners well. One can only claim its efficacy so long as no coup attempt succeeds, which is little comfort for those who seek reliable ways to keep the military in the barracks.

The legitimized modality is the third broad strategy for maintaining civil-military stability, whereby the military internalizes the concept of civilian supremacy. During the period under study, the six countries that relied on this strategy were Botswana, Gambia (now off the list), Malawi, Mauritius, Swaziland, and Tanzania. Several factors are said to promote the observed systemic legitimacy, including the absence of divisive subnationalities (or where it is present, mitigated by the force of the personality of the founding fathers) and the permeation of traditional values consistent with competitive democracy. Malawi is not, in my opinion, an appropriate case

study of this modality. Botswana might have served the author better. The control policies adopted by President Banda of Malawi have often been cited by incoming juntas as the reason for their coup. The policies include a "network of spies and ancillary structures (including the Young Pioneers)" (p. 40), privatization of political power, regional/ethnic politics, terror, personal charisma, and the appointment of loyal commanders to discourage military rule. The coup in the Gambia in 1994 further questions the adequacy of the policies that constitute the legitimized modality. These considerations lead to the question of why a combination of some selected policies deters a coup in one country but instigates a coup in another. Decalo's claims remain unpersuasive until this question is addressed.

The final chapter examines the sources of the "democratic upheavals" in the continent in the early 1990s and assesses the constraints and challenges of the redemocratization process. The issues addressed are valid but are only tangentially relevant to the main project. The chapter confirms my lingering feeling that much of the analysis in the book is not rigorously deployed to show why there is civil-military stability in the cases examined. It becomes, then, a study of the politics of three African countries that happen to have evaded military rule. Considering the paucity of concise literature on the politics of Gabon and Malawi, the effort is certainly worthwhile. For the most part, however, Decalo's discussion of the politics of these countries does not reveal how such politics uniquely foster the civil-military stability that has eluded dozens of other African countries.

It turns out that the expectations developed from reading the cover and chapter titles of the book remain largely unfulfilled. One does not learn how the nascent process of redemocratization in the continent can be kept safe from praetorian (mis)adventurers. Except perhaps in the peculiar case of countries that rely on France for protection against military rule, the "unstable majority" bountifully deploys such antidemocratic tactics as authoritarianism, bribery, corruption, nepotism, unaccountability, repression, and economic mismanagement. The book asks the right questions, but the reader awaits more rigorous comparative treatment.

Developing Democracy: Toward Consolidation. By Larry Diamond. Baltimore, MD: Johns Hopkins University Press, 1999. 261p. \$55.00.

Problems of Democratic Transition and Consolidation: Southern Europe, South America, and Post-Communist Europe. By Juan J. Linz and Alfred Stepan. Baltimore, MD: Johns Hopkins University Press, 1996. 479p. \$55.00 cloth, \$18.95 paper.

Timothy J. Power, Florida International University

In recent years, the global advance of polyarchy has fostered the integration of comparative politics by encouraging area specialists to look outside their regions and examine the process of democratization in a truly comparative and cross-regional fashion for the first time. More important, the maturation of the literature on the third wave of democratization (which is now older than the undergraduates reading about it) has made possible the emergence of some truly cumulative efforts to make sense of this phenomenon.

The two books under review are easily the best of these new integrative and cumulative efforts. Topically, they are comprehensive introductions to the general phenomenon of democratization, superseding such earlier landmark studies as O'Donnell, Schmitter, and Whitehead's Transitions from Authoritarian Rule (1986) and Huntington's The Third Wave

(1991). Geographically, both works cast extraordinarily wide nets, drawing on cases from three or more regions. Temporally, both volumes focus on the third wave (post-1974), although they occasionally draw on the lessons of the earlier waves and reverse waves.

It is not surprising that both books have similar overarching questions and concerns, given that all three authors have worked together closely, and many of the scholars they cite have cooperated on various projects in the past. Without downplaying the many novel and individual contributions made by each book, it is clear—as the authors acknowledge in their respective prefaces—that these volumes can also be viewed as distillations and critiques of the work of the international network of democratization scholars that has taken shape over the past two decades (and whose debates have been featured most prominently in the *Journal of Democracy* since 1990). Scholarly networking, dialogues, and cumulative refinements of theory are used to spectacular effect in each volume, setting an example for the profession.

Notwithstanding the broad similarities between these two books, there are important differences. These are most visible in the scope and depth of each, in their conceptual emphases, and in the key independent variables upon which they draw to make several important arguments about contemporary democratization.

With regard to empirical depth, Linz and Stepan are more ambitious than Diamond. Their book is divided into four parts; the five-chapter "Theoretical Overview" is followed by three regional sections. Part 2, on southern Europe, features chapter-length case studies of democratization in Spain, Portugal, and Greece. Part 3, on South America, covers Brazil, Argentina, and Chile. Part 4, on postcommunist Europe, examines Poland, Bulgaria, Romania, USSR/Russia, Estonia, and Latvia. Part 4 is the longest section, occupying nearly half the book, and is the most original and interesting, given the ample secondary literatures on the other two regions. Although approximately 80% of the book is devoted to the case studies, that material is impressively well connected to the conceptual introduction, thus bridging the gap between theory and exposition that is often found in such ambitious projects. Linz and Stepan move easily among historical legacies, social-structural contexts, and the play-byplay of contemporary transitions in each country, building a set of case studies of remarkable depth and richness.

In contrast, Diamond does not rely on country-based studies and is more thematic in treating the conditions for sustainable democracy, with a focus on such undertheorized variables as political culture and the relationship between polity size and democracy. Another major difference between the two books is the level of analysis, which for Diamond is global. He is much more interested in democratization as a world-historical phenomenon, asking whether the third wave is over and under what conditions there might be a fourth.

In the analytical and conceptual domain, there are crucial differences in how democratization is problematized, as reflected in the respective titles. Linz and Stepan examine both democratic transition and consolidation, whereas Diamond is exclusively concerned with the latter. Linz and Stepan extend their focus retroactively to the preceding nondemocratic regimes in each case, offering a wide-angle lens on the dynamics of political change. An updating of Linz's classic typology of nondemocratic regimes (chap. 3) figures prominently in the theoretical framework; in fact, this book has nearly as much to say about authoritarianism[s] as it does about democracy. As one would expect, Linz and Stepan's more case-driven approach facilitates this greater historical sensitivity; in some cases their reach extends back

to earlier historical episodes of democracy, which allows them to examine prior experience as an independent variable in explaining contemporary processes, particularly in the lesser known East European cases. Diamond, in contrast, states explicitly that his book "picks up where Huntington's [The Third Wave] left off" (p. xi). Huntington successfully explained how and why thirty countries transitioned to democracy between 1974 and 1990. Diamond, picking up the trail, seeks to know whether these new democracies will be sustainable, that is, whether they will "consolidate."

The concept of democratic consolidation is controversial and contested. Recent critics pronounce it tautological, teleological, and impossible to operationalize. To raise the topic at all is to enter a theoretical minefield, but to their credit, the authors do not shrink from the challenge. Linz and Stepan immediately pose an ideal-type definition of consolidation; democracy becomes "the only game in town" in three major dimensions: behavioral, attitudinal, and constitutional. The use of an ideal type relieves them from attempting controversial "threshold" operationalizations; rather, they analyze the "crafting" of consolidation in each country-case and make considered, qualitative judgments about the direction of change in each of the three dimensions.

Whereas Linz and Stepan dispense with the consolidation debate in their very brief first chapter, Diamond undertakes a far more nuanced and reflective discussion of the concept (chap. 3). His model of democratic consolidation is broadly similar to that of Linz and Stepan but is more formalized. Democratic consolidation takes place in two dimensions norms and behavior—on three levels. The first level is top elites and decision makers; the second is intermediating organizations, such as parties, unions, and interest groups; the third is the mass public. This conceptual scheme yields an elegant two-by-three matrix for ordering the data. Diamond argues that "when all six of these cells show substantial normative commitment to democracy and behavioral compliance with its rule and limits, democracy is consolidated" (pp. 68-9). His discussion of exactly what to look for in these cells is considerably more concrete, direct, and user-friendly than the comparable material in Linz and Stepan. For example, the assertions that mass support for democracy should reach the level of 70-75% in public opinion polls, and that active rejection of democracy should not exceed 15%, may be "arbitrary," as Diamond admits, but at least this brings us closer to a usable yardstick for measuring consolidation.

Unlike Linz and Stepan, Diamond explicitly recognizes some of the recent criticisms of the democratic consolidation concept and thoughtfully rebuts them. He also develops an interesting typology of nonconsolidated democracies, regimes that meet minimal definitions of polyarchy but clearly do not fit his model of consolidation, and illustrates how the external contours of these regimes may deceive analysts. Thus, Diamond's theoretical treatment of consolidation improves considerably on the Linz and Stepan effort, and it is one of the finest available introductions to this thorny topic. Yet, Diamond's more global, conceptual, and future-oriented framework means that his empirical examples are less well developed than the rich, mature case studies of Linz and Stepan.

Each book trumpets a series of independent variables considered crucial to successful democratization. The choices are foreshadowed in the earlier work of these distinguished scholars. For Linz and Stepan, some of the key factors are the nature of the prior nondemocratic regime, legitimacy and the global *zeitgeist*, civil-military relations, effective citizenship, civil society, and the presence of a "usable state." They place considerable emphasis on "stateness," linking this variable to

nationalism and ethnic heterogeneity, most effectively in their treatment of Spain and in their paired comparison of Estonia and Latvia. Diamond agrees with several of these theoretical emphases—particularly on civil society, which merits an entire chapter—but gives much more weight to culture, values, and mass opinion. His chapter 5, on the role of political culture in democratic consolidation, is a tour de force, capable of causing the most committed anticulturalists to rethink their views. This chapter is by far the most empirically impressive in his book, drawing on cutting-edge public opinion research from several continents.

Diamond also gives substantial attention to the transnational dimension of democratization.

Perhaps the most distinctive feature of the third wave is the considerable contribution that international actors have made to democratic development by enhancing the resources, skills, techniques, ideas, linkages, and legitimacy of civil society organizations, civic education efforts, the mass media, legislatures, local governments, judicial systems, political parties, and election commissions in the developing and postcommunist worlds" (p. 272).

His final chapter is devoted to the need to fortify these linkages so as to secure the continued advance of democracy in the coming century. For Diamond, a continuous agenda of democratic reform is as healthy and as necessary for long-established polyarchies as it is for nascent democracies. If both groups of countries can pursue such an agenda simultaneously, a fourth wave might be generated. As Diamond notes, however, the third wave taught us to expect the unexpected.

In summary, these two excellent books represent the state of the art in the study of global democratization. Taken together, they encompass an exhaustive panoply of variables, debates, and empirical referents that should be digested by anyone interested in democratic change. Any shortcomings lie in their minimal attention to the role of macroeconomic policy and performance in achieving democratic sustainability, a lacuna best filled by Haggard and Kaufman's The Political Economy of Democratic Transitions (1995). Both volumes are likely to become classics in the field of comparative politics. Not only will they take their deserved places on the shelves of scholars, but also they may be used quite profitably in the classroom. Problems of Democratic Transition and Consolidation is certainly a must for a wide range of graduate seminars. Developing Democracy, written in a more accessible and practical style, is better suited for undergraduates. Reading Diamond's book as he intended it, in conjunction with Huntington's The Third Wave, would provide students with an unparalleled overview of democratization in the late twentieth century and beyond.

Capitalism Russian-Style. By Thane Gustafson. New York: Cambridge University Press, 1999. 264p. \$54.95 cloth, \$19.95 paper.

Timothy Frye, Ohio State University

Few observers are better prepared to comment on the transformation of the Russian economy than Thane Gustafson. A self-described old Soviet hand, he has spent the last decade analyzing economic developments in Russia both as an academic and as a consultant to some of the largest oil companies in the world. He has traveled widely in the region and has interviewed many of the important players on the Russian economic stage. This background gives him a keen sensitivity to the context in which economic reforms have

unfolded in Russia and access to decision makers at the highest level. Gustafson puts these assets to good use in *Capitalusm Russian-Style*, an excellent overview of developments across a range of sectors in the Russian economy during the last decade.

The book has chapters on industrial privatization, the equities market, the banking sector, small business, crime, the rule of law, the Russian state, and the social aspects of transition. The first three are especially good. Detailed, thorough, and argued with good sense, these chapters recognize the scale of the changes that have occurred in the Russian economy without understating the distance yet to travel. Gustafson notes that a "revolution has indeed taken place in Russia. . . Yet its main legacy so far is a weak state, a private sector deformed by the manner of its birth, an economy stuck halfway between the command economy and the market, and an unsettled ambivalent relationship between state and society" (p. 33).

Three themes recur throughout the work. First, Russia's transition has been very difficult, but the scope of economic change in the last ten years is "revolutionary" and "irreversible." This revolution was brought on by the creation of a money-based economy despite extensive barter among industrial enterprises, the transfer of property from state to private hands by various legal and illegal means, and the collapse of the Soviet state. Gustafson draws on a range of evidence, including the financial crash of 1998, to support his view that economic change has been extensive. He argues that the crash not only laid bare the weak foundations of the new market economy but also "revealed how far Russia as a whole had moved away from the command economy. Russia's very vulnerability to world commodities prices and movements of capital showed how open the economy had become" (p. 16).

Second, the weak Russian state has distorted reform efforts across all sectors. In Gustafson's view the state is too weak and disorganized to provide public goods to support reform, but it is still strong enough to expropriate wealth. For example, the disorganized state has stifled small business by oppressive taxes and regulation, and the central bank has used its regulatory power to enrich itself as much as to bring order to the market. Indeed, Gustafson identifies the reconstruction of the state as a key task for building a market economy in Russia in the twenty-first century.

Third, perspectives that view the transformation either as a transition to a market economy or as a nomenklatura takeover are "true as far as they go, but fail to capture the full sweep of what is happening" (p. 16). Gustafson uses the privatization of industrial enterprises to illustrate his preferred view, a synthesis of the transition and takeover perspectives. Granting that old regime insiders have benefited the most from economic reform in Russia, Gustafson argues that in some cases they are also leading the transition. For example, insiders in many sectors shun restructuring, but in some oil companies and some auto companies they have adapted quickly to the market. Gustafson makes a similar point when recounting the battles over industrial privatization. "Given the circumstances of Russia in 1991-1994, insider takeover was inevitable, and there is little alternative to insider control today. As for the behavior of the insider managers, it is on the whole a reasonably sensible response to an environment that still discourages changes in most (but not all) sectors of the economy, and the mode of privatization is only partly to blame" (p. 38). Such provocative arguments make the book a joy to read but will spark disagreement in

Because the target audiences for the book include academics, policymakers, businesspeople, and Russia watchers of all

stripes, Gustafson must walk a fine line between simplifying the argument for a general audience and making it sophisticated enough to satisfy academics. He manages quite well. For example, the quotes that begin each chapter are typically as insightful as they are entertaining.

On the negative side, there is insufficient attention to politics. Given the close connection between politics and economics in Russia, one might have expected greater focus on the changing political dynamics that shape economic reform. (Those awaiting a tell-all book on the oil and gas industry in Russia, which Gustafson is well positioned to write, will have to wait. Indeed, this book could have given more attention to this sector, given its importance for the economy.) In addition, there is some indication of haste. The book was finished in spring 1999, in the aftermath of the financial crisis of August 1998. This event casts a long shadow, and in places the text reads as if it were written rather quickly. Chapters on organized crime and the rule of law are somewhat less developed than others, perhaps due to their subject matter as much as to the difficulty of writing an "instant history."

Some observers will challenge Gustafson's optimism about the distance that Russia's economy has traveled since 1990, particularly given the events of August 1998. Several chapters include a barrage of dire statistics about the progress of economic reform, but they conclude with a reference to the silver lining behind the dark clouds. Debates typically focus on the proper benchmark rather than the extent of change in the economy. Pessimists declare the reforms a failure because they have not lived up to the promises made by Russian politicians, Russia has fallen behind Eastern Europe, living standards have fallen dramatically, and growth rates have been negative for most of the last ten years. Optimists argue that due to the constraints facing Russia, progress has been about as much as could be expected. Given the influence of rent-seeking lobbies, a large military industrial-complex, extensive spontaneous privatization before the collapse of the Soviet Union, the federal system, and the weak institutional environment, economic reform has not fared badly.

As a longtime Russia watcher, Gustafson implicitly compares the contemporary scene to Gorbachev's era and makes a strong case that the two bear little resemblance. "The distance is truly from one civilization to another" (p. 9). Gustafson proves an insightful and entertaining commentator. The book is an excellent primer on the key players, decisions, and events that have shaped the Russian economy today. For those who have watched the transformation more closely, the book offers some provocative arguments and much common sense. Gustafson has done an excellent job of blending primary and secondary literature on various aspects of Russian reform with his own extensive experience, perceptive anecdotes, and keen insights. Both scholarly and general audiences will find much to like in this rewarding book.

Ideas and Economic Policy in Latin America: Regional, National, and Organizational Case Studies. By Anil Hira. Westport, CT: Praeger. 1998. 337p. \$64.95 cloth, \$24.95 paper.

Javier Corrales, Amherst College

Knowledge is power. Everyone understands this. But how exactly knowledge becomes powerful is less well understood. More specifically, how do the ideas that experts embrace become influential in politics? This is the topic of Anil Hira's highly readable book. The central argument is that "ideas are vital to explain variations in reactions to international

shocks" (p. 6). Hira studies reactions at two levels, the regional and national. To assess the former, he focuses on Latin America's switch in developmental models during the twentieth century: from economic liberalism to early stages of import substitution industrialization (ISI) in mid-century; from ISI to a more capital-intensive import substitution (ISI2) in the 1960s; and from ISI2 to neoliberalism in the 1980s. To assess national responses, Hira focuses on Chile's journey from structuralism (until 1970), followed briefly by failed socialism under Salvador Allende (1970–73), to neoliberalism under Augusto Pinochet (1973–89).

The author's first accomplishment is to convert this commonly accepted sequence of economic models into a mystery in and of itself. For Hira, there is nothing inevitable about this sequence. Nothing dictated that Latin America, at each of these moments, should turn in the direction that it did or that Pinochet would privilege neoliberalism over competing ideologies. A focus exclusively on the role of economic crises, Hira argues, helps explain the timing of some of these turning points but not their direction. A focus exclusively on interest-group or class-based politics also is insufficient, because at the time of each change the dominant coalitions and classes were opposed to the chosen paths.

A complete explanation requires specifying exactly how certain ideas and not others become influential. Hira argues that not all existing ideas have an equal chance of becoming powerful. To prevail, ideas must share certain characteristics, some of which are political in nature. For instance, they must be part of what Hira labels "knowledge networks," which are "communities of organized groups of experts trained in economics who utilize this knowledge to gain a political position" (p. 13). These networks, in turn, must have a common set of political resources: strong leader, loyal followership, strong links to academic institutions or think tanks, and independence from overtly political organizations (parties). Among all these features, the last is probably the most original and possibly the most controversial. Close association with political parties renders knowledge networks less powerful, Hira argues, because it restricts their appeal beyond partisan sectors.

The other characteristic that makes ideas powerful relates to inherent features of the ideas themselves. They must have a well-developed doctrine and must provide answers to pressing policy questions of the time (e.g., how to diminish dependence, restore growth, end inflation). This specific feature is less easy to operationalize than Hira would like and, hence, less easy to test. Incidentally, this list of features is not apparent in the empirical chapters, but it is presented in a summary table toward the end of the book (p. 143).

This set of features is what unites structuralism in the postwar period and neoliberalism in the 1980s, and hence their respective ascendance in Latin America. One of Hira's important contributions—infrequent in studies of the role of ideas—is to show that ideas which do not exhibit these characteristics stand less chance of capturing the state and becoming dominant (e.g., fascism in the 1940s, radical structuralism in the 1960s; neostructuralism in the 1980s). When President Allende selected one of these politically handicapped ideas (radical structuralism), he was bound to stumble.

Despite these accomplishments, Hira's argument will not satisfy the appetites of serious students of the role of ideas. At the very least, Hira should have "talked" more to his intellectual peers, explaining exactly how his framework differs from those of scholars who also theorize about the role of ideas, such as Robert Keohane, Judith Goldstein, Peter Hall, Peter Haas, Patricio Silva, Verónica Montesinos, Kathryn Sikkink, and Jorge I. Domínguez. The parts of Hira's argument that are borrowed from these authors are more evident than the parts that are innovative.

In some ways, Hira cannot account for crucial variations in the degree of idea implementation. As he acknowledges, not all the ideas that form part of prevailing knowledge networks get implemented. At the peak of structuralism, not all Latin American countries embraced it equally forcefully. And within each country, not all tenets of prevailing ideas get implemented equally forcefully. In Chile in the 1960s, for instance, the state chose not to prepare the economy for regional integration, a central tenet of structuralism, and in the 1980s it chose not to implement antitrust policies, a central tent of neoliberalism. This asymmetry in the degree of dominance of various components of knowledge networks is problematic. It makes Hira's argument susceptible to the same criticisms that he levies against rival hypotheses, namely, difficulties in accounting for variations in the dependent variable.

Although Hira discusses alternative explanations, he does not discuss an elementary counterargument: What matters most are "the President's ears," to use Stephen Krasner's phrase. Krasner meant that whatever the president chooses to hear is what becomes influential. The president's biases determine which ideas become powerful. The president selects cabinet members on the basis of ideological affinity, and they in turn populate the bureaucracy with like-minded staff. Thus, when Pinochet appointed superministers such as Jorge Cauas or Sergio de Castro, he essentially rendered their ideas powerful. "Pinochet's respect and trust of the Chicago Boys, however, gave that group a much wider ability to present challenging opinions" (p. 85). If all boils down to the president's predilections and endorsements, then the panoply of factors that presumably render a knowledge network powerful become less relevant.

I am not suggesting that the presidential value hypothesis is superior. In fact, Hira's own framework and evidence could easily be marshaled to rebut it. Hira could have argued more explicitly that there is something about the way in which ideas come packaged that makes them more "pickable" than others. But he does not make this argument explicitly, which leaves the reader uncertain as to where the real independent variable lies.

In the end, Hira wants to think of the relationship between presidents and ideas as interactive. Presidents grant power to experts and their ideas, and these in turn empower presidents. Each actor gains from the other. At one level, this is a creative way to think of the political role of experts. At another level, it is too vague a predictor of the extent to which presidents will align themselves to certain ideas. Clearly, not all experts or ideas become political assets to presidents. Some can at times become political embarrassments.

Despite these problems, Hira's book represents a useful way of thinking about the appeal of ideas without necessarily entering into debates about their normative merits or affinity with the preferences of the population. Few other analyses of the role of ideas, especially on Chile, can claim such normative impartiality.

When the Romance Ended: Leaders of the Chilean Left, 1968-1998. By Katherine Hite. New York: Columbia University Press, 2000. 246p. \$49.50 cloth, \$22.00 paper.

Paul W. Drake, University of California, San Diego

Katherine Hite contributes to the comparative analysis of the redefinition of the Left, especially the Marxist variety, since the end of the Cold War. She studies the salient case of Chile, which has had the most successful electoral Left in Latin America. It has had global repercussions because of the attempt to create socialism through democratic means under

President Salvador Allende (1970–73), his violent overthrow by General Augusto Pinochet (1973–90), the resurgence of the socialists during redemocratization and their participation in the restored civilian government (1990–2000), and the election of the second socialist president, Ricardo Lagos (2000–06). Just as these events influenced leftist thinking around the world, so international changes on the Left affected the Chileans. To trace the evolution of Chile's leftist movement from Allende to Lagos, the author interviewed political leaders from the Socialist, Communist, and smaller leftist parties.

This book also speaks to scholars concerned with political elites and identities. In her discussion of rational-choice and identitarian explanations for the behavior of politicians, Hite faults the former school for failing to illuminate seemingly irrational actions on behalf of collective ideological goals, a common trait among Chilean progressives. She shows that leftists were defined by their traumatic formative experiences and by their social and political networks. She underscores the enduring influence of families, political parties, and historic victories and defeats. And she establishes that the orientations of these elites helped determine the trajectory of Chilean politics.

From about 100 interviews, Hite selected 25 individuals for intensive investigation and 15 as case histories for inclusion in the book. All the interviewees became leaders during the intoxicating Allende experiment, suffered exile under the demoralizing rule of Pinochet, and helped moderate the Left and reconstruct democracy thereafter. Throughout these thirty years, the Allende episode as well as their generational, class, and educational backgrounds continued to shape their beliefs and actions. Despite monumental changes in their country, in their lives, and in their political strategies, these leaders held fast to their early cognitive frameworks and memories.

In terms of their basic approach to politics, they can be clustered in four camps: political party loyalists, personal loyalists, political thinkers, and political entrepreneurs. Hite reveals how their membership in one of those camps molded their political behavior, but she says less about why they fall into a particular camp. She does not really tell us whether that membership was a result mainly of political history and learning or of social and psychological predispositions. For example, it is not fully clear whether certain people became political thinkers rather than personal loyalists because they were more influenced by universities than by Allende or because they were intrinsically more inclined toward intellectualism than personalism.

Hite discovers that party loyalists have been socialized by their immersion in the subcultures of political parties. They continue to dwell on party organizing and recruiting, even though the days of mass mobilization—whether for Allende or against Pinochet—have been superseded by consensus and caution among the ruling elites. Personal loyalists have been conditioned by their attachment to a meamerizing leader, particularly Allende. They promote that leader's vision, regardless of party postures, and they remain relevant in an era when party ties are eroding. Political thinkers have been more infatuated with ideas than with parties or personalities. They have undergone exceptional mutations, principally from Marxist to social democratic programs, and now chart the course of moderation and modernization in the new democracy. The political entrepreneurs have been motivated by pragmatic power seeking. These flexible gradualists and deal makers dominate the highest political offices in Chile

In sum, the political earthquakes from the 1960s to the

1990s left unchanged the attitudes and activities of the political party and personal loyalists but transformed the beliefs and behaviors of the political thinkers and entrepreneurs. The first two groups prevailed during the high optimism of the Allende presidency and the deep pessimism and defensiveness in the years immediately after the Pinochet coup. The thinkers took center stage from the late 1970s through the mid-1980s, when the Left renovated its ideas and its plans for reinventing democracy. From the late 1980s through the 1990s, the pragmatists took charge of engineering and managing the new regime.

Hite presents her material in supple prose. Grounded in extensive research, her interpretations are subtle, nuanced, and cogent. Although more descriptive than theoretical, her autobiographical method and typology, as well as her analyses and insights, are useful for those who want to understand the complex history of the Chilean leftists and of their counterparts in many other countries.

Inflation and Investment Controls in China: The Political Economy of Central-Local Relations during the Reform Era. By Yasheng Huang. Cambridge: Cambridge University Press, 1996. 371p. \$64.95 cloth, \$24.95 paper.

Wenfang Tang, University of Pittsburgh

This well-written and academically rigorous book examines how the central government in China controls local investment behavior and the variation of investment behavior in different provinces. The author begins with an intriguing question: Why did China not have runaway inflation as did other former centrally planned economies that underwent market reform?

There were many reasons to believe that China would experience uncontrolled investment and inflation. It was a centrally planned economy with soft budget constraint. Unprofitable investments were rarely punished, and local officials would benefit from local investment projects (chaps. 1 and 5). In addition, economic decision making was decentralized during the Cultural Revolution and was never fully recentralized in the post-Mao era. Local governments not only enjoyed extensive autonomy in output planning and goods allocation but also gained control over the lending operations of local specialized banks. Local governments also developed other financial levers, such as bond issues, extrabudgetary revenues, nonbank financial institutions, and foreign direct investments. More important, the new tax contract system made the local government the residual claimant of profit (chaps. 2 and 3). All these would lead to increased local investment and local investment interests that diverged from the center. Yet, investment was disciplined, and inflation was under control in China.

The key to this puzzle lies in the political sphere. Unlike the other centrally planned economies, in China the Communist Party never lost its grip on political power, particularly the power to appoint and remove local officials. After 1983, central control over provincial governments even strengthened, as the structure of provincial government became more unified, the length of tenure among provincial leaders was shortened, and the overlap between provincial party and government posts was reduced. Another measure to increase central control was selective integration of local officials into the central government. Those selected through this process developed a strong career incentive to obey the center, even if it meant sacrificing local investment interests (chap. 4). By using biographical data on provincial leaders and provincial investment statistics, the author shows that central control

over local bureaucratic personnel (e.g., bureaucratic integration and shortened tenure) increased local investment compliance with the center (chaps. 6, 7, and 8).

The book bears some similarity to Kornai's well-known discussion of centrally planned economies, especially in the discussion of soft budget constraint and investment hunger (chaps. 1 and 5). Yet, Huang differs from Kornai's approach to reform, which seems to suggest that the root of the problem in centrally planned economies lies in the political system and that political decentralization and democratization should go side by side with, if not precede, economic reform (Janos Kornai, The Socialist System: The Political Economy of Communism, 1992). For Huang, China's success in avoiding runaway inflation during market reform was precisely due to the lack of political decentralization. Huang goes even farther by describing China's system as federalist, with the center in control of personnel decisions and localities in control of financial decisions. The need for the center to rely on localities for financial contributions to fund central projects provided the latter with significant participatory power and made such a system more democratic (chap. 9).

It is timely to read this book in early 2000, when China reportedly has too much savings and stagnant domestic investment. The system the author describes appears too effective to be true; he has underplayed factors, such as lagging domestic capital productivity, that also determine investment behavior in China. When the market reform deepened, profitability became an important consideration for investment projects. Due to the lack of technology and managerial capacity, Chinese firms were unable to generate high investment returns. No one wanted to invest in a market economy under tightened local budget constraints if investment meant losing money. This may be another reason domestic investment was limited in the 1990s in China. The low level of domestic capital productivity could also explain the rapid increase in foreign investment during the same period. Foreign investment, usually accompanied by superior technology and managerial skills, was able to generate higher returns. The problem is not how to control investment but how to improve domestic capital productivity.

The book only focuses on the relationship between the center and the provinces. It does not talk about state-owned enterprises and their relationship with higher-level government. These enterprises are an indispensable link in the web of political and economic organizations in China. Ultimately, investment projects have to be carried out by enterprises. The political and economic incentives for enterprise officials, and the political and economic environments in which the stateowned enterprises operate, are too important to omit in discussing investment policy. This is not to say that the author's model is invalid. In fact, it often fits very well in discussing the relationship between the enterprises and higher-level government. For example, the principal-agent model and the author's description of the central-local relationship can be easily applied to the state-owned enterprises. Personnel decisions are controlled by higher-level government, but directors in these enterprises enjoy a wide range of decisionmaking power in operations, and their incentive structure is shaped both by bureaucrats' career paths and their company's self-interest. A fully developed model of investment behavior and central-local relations thus may also need to include the state-owned enterprises.

Although the highly academic writing style makes it no easy task to read this book, especially for students without sufficient vocabulary in economics, the carefully built model and ample empirical evidence make this one of the most authoritative studies of central-local economic and political

relations in China. I have seen few studies of China that incorporate the two disciplines of economics and political science so smoothly.

The Politics of Economic Restructuring and Democracy in Africa. By Obioma M. Iheduru. Westport, CT: Greenwood. 1999. 184p. \$49.95.

Anthony Tuo-Kofi Gadzey, Auburn University

Whether IMF conditionalities produce more hardship and condemnation than economic growth is a controversy difficult to pin down in terms of concrete benefits and costs. What if there is a third, unintended, positive outcome? In its barest essence, that is the conundrum Obioma Iheduru sees from the implementation of IMF conditionalities in sub-Saharan Africa during the 1990s. The infusion of external capital is said to have produced a new political dynamic, fostering greater democratization in the subcontinent than was otherwise possible.

On the brink of financial collapse, as many as 26 African states were forced to seek IMF loans, and with them came draconian IMF economic adjustment measures. These included devaluation that sharply hiked up prices of manufactured imports, which for countries lacking a manufacturing base means virtually all nonagricultural products. IMF impositions always create clear winners and losers. With their government-guaranteed huge salaries, the ruling, bureaucratic, and military elites hardly feel the pain of economic adjustment. And they are quick to use the IMF's preference for market solutions that preclude state intervention in the economy as an excuse for withdrawing state subsidies that might cushion consumers against increased prices.

That leaves the economically powerless class of farmers, private sector employees, low-paid government workerssome of whom must take pay cuts—and unemployed city dwellers as the clear losers. Traditionally, this class has never shown the organizational ability to resist their rulers' strategy of transferring to them the burden for their greed and power grab, which are responsible for the destruction of the African state in the first place. Not this time. All over the subcontinent, the announcement of IMF impositions was met immediately by spontaneous mass protests. In the past, protests lasted a day or two, but these were sustained for months, even when scores of protesters were killed, until the rulers made major concessions, including withdrawal of the harshest measures and the holding of elections. That ordinary people hitherto unknown for standing up to their leaders should show such organizational discipline and achievement is seen by Iheduru as the beginning of meaningful democratization in the subcontinent (p. 55). By inference, the author sees a linkage among the injection of external capital, subsequent economic growth (pp. 80-7), and political liberation of the people (pp. 88-94), an apparent confirmation of the longheld Lipset thesis linking economic growth and democratiza-

On its face, the theory is straightforward and powerful. Lacking the internal dynamics for achieving economic growth and democratization, Africa can obtain both through a greater infusion of external capital, provided it is channeled through the people to increase their power vis-à-vis government. Indeed, in accepting IMF impositions, rulers were seen by the people as loosening their grip on power sufficiently to open room for them in decision making. Iheduru's focus on how real people live their lives and try to cope with the declining scope and ability of the African state system is a welcome new direction in African development research.

Classical and neoclassical theories predicate African development on the institutionalization of Western democratic and open market structures, but the new emphasis is on people's interests, their skills and capabilities or the lack thereof. Institutions are important but at best are only instruments. Those who use these institutions and how they are used are more important in telling us whether real development progress is being made.

As welcome as that focus is, those who embrace that research agenda must avoid exaggerating the accomplishments of people power in Africa, a standard not met in this book. The proposition is articulated well and backed by empirical analysis, but the author does not convincingly defend the two points critical to confirmation of the Lipset thesis in the sub-Saharan case: (1) whether the injection of IMF capital actually produced economic growth, and (2) whether the emotional demonstrations over time were transformed into permanent forms of broad political participation and democratization.

The IMF loans were borrowed largely to shore up shortfalls in government revenue rather than for investment in new development. Typically, they have not generated economic growth, or even sufficient repayment capacity, so debt service capital must come from cuts in social programs. Iheduru concludes that "foreign capital was not particularly important or helpful in stimulating economic growth in Sub Saharan Africa during the period of this study" (p. 87). The evidence is equally weak regarding the link with democratization. The protest movement showed unprecedented power and potential, but democratization is a process that must be observed over time; Iheduru measures it in terms of the obvious diminished ability of ruling elites to regulate and control political participation during the crisis (p. 89). Instead, we must know what happens to these groups over time. Did they last beyond the protest objectives? Did they spur a new class of African leaders? Did any of these ad hoc coalitions go on to form permanent parties and government? Did government concessions last longer than the time required to appease angry demonstrators? On these questions the book is silent. If recent elections in Nigeria, Ghana, Cote d'Ivoire, and Kenya as well as the ongoing civil wars in Liberia, Sierra Leone, the Congo, the Sudan, Rwanda, and Burundi are any measure, then regime intolerance and elite struggles for power, not widespread inclusive politics, remain the defining forms of politics in the subcontinent, the protest movement notwithstanding.

Reflections on Revolutions. By Mark N. Katz. New York: St. Martin's, 1999. 146p. \$25.95.

Timothy Wickham-Crowley, Georgetown University

Mark Katz's method here is to juxtapose several well-known (e.g., Barrington Moore, Crane Brinton) and less well-known (e.g., Liah Greenfeld and Abdallah Laroui) theorists on revolutions with his own reading of case studies and then assess "how we're doing." There is a freshness (in both senses?) throughout this little book when he assesses the work of previous scholars. The tone is established immediately, when he suggests replacing the older metaphors (such as Brinton's revolutionary "fever") that lie behind our analyses of revolutionary regime shifts with a new one, which I would term "parricide on the farm." This analysis must be read to be appreciated (or to be irritated by); he uses a folksy-agrarian imagery to translate (there is no other term) the big theories of Gurr, Skocpol, and Goldstone. It is all good fun, but I am not sure whether it furthers the study of

revolution in any substantive way, given the lack of currency that Brinton's old fever metaphor enjoys.

Katz's assessment of Moore's Social Origins of Dictatorship and Democracy (1966) is straightforward but is unlikely to convince either those who accept Moore's pathbreaking ideas and apply them critically (e.g., Jeffery Paige, Coffee and Power, 1997) or those who reject Moore's analyses, but on different grounds than does Katz. He says, rather simply, that revolutionary successes and (later?) their failures have transnational influences that alter events elsewhere, and he also asserts that nationalist forces have often been central to revolutionary outcomes. His companion reference to the multiclass forces and coalitions in revolutionary outcomes is now a commonplace in the post-Social Origins literature, however, and is not ignored in Moore's own work, in which, for example, the crucial alliance between the landed elite and a weak bourgeoisie is the key to the fascist outcome.

Katz's analysis of the underappreciated work by Abdallah Laroui is for me a partially welcome resuscitation. Laroui's view (via Katz) is that the petite bourgeoisie are the key leaders of many Third World revolutions that seek at the start to promote "revolutionary socialism"—by the bourgeoisie?!—but create, in their own image I guess, "petit bourgeois regimes" that later succumb, with few exceptions, to "capitalist-roader" (my usage) embourgeoisement. This is certainly a different theory of revolution, yet Katz's revival of Laroui is only partially welcome, for several reasons. I find their use of the term "petit bourgeois" remarkably inconsistent and overly broad, and I am utterly unconvinced that the persons who headed these new regimes were, in fact and in disproportion, drawn from the social class that Marx and other sociologists have identified with small property owners, mainly urban, sometimes rural.

Certain artisan-type actors were deeply involved with historical urban food riots, and so on, in some (N.B.) instances critical to revolutions (e.g., France 1789, Petrograd 1917), an older observation made by E. J. Hobsbawm, George Rudé, Moore (Injustice, 1978), and others. But to say those same actors controlled the new regime is a dog that won't hunt. Indeed, Richard Hamilton and William Brustein have made persuasive cases for Europe that some of these groups (especially the rural ones) are much more likely to be fascists than revolutionary socialists, and of course the older literature (now disputed) puts the social base of fascism firmly among that same petite bourgeoisie ("the lowermiddle class thesis"). By way of final comment, that such regimes succumb to embourgeoisement and capitalist privatization is a theoretical expectation of world-system theory (of which I am not an advocate, by the way), which sees such outcomes as rather likely when socialist movements gain control of states within a world capitalist economic order that the socialists do not control, and before which they eventually

Other authors get their fifteen pages of fame as well. Liah Greenfeld, in a book unfamiliar to me, puts a nationalist sense of ressentiment, especially in its ethnic form, at the heart of many historical revolutionary surges. Katz largely agrees but insists that ressentiment can shift rapidly from one level to another (e.g., its virtual elimination in Italy following Mussolini's defeat). This all strikes me as very reasonable, but the methodologist in my ear whispers two contrarian things. How is this phenomenon being measured? If Greenfeld is assessing and asserting it in the same breezy manner as Katz, then we may have severe problems of measurement validity. Moreover, are Greenfeld and Katz also asserting that high levels of ressentiment will always or with great probability build to revolutionary upheavals and/or that its

absence will mean a low likelihood of revolution? There is no evidence I can see that such cautions were entertained here.

In contrast, I rather liked Katz's (via Ted Gurr) analysis of the successful breaking off of new states, that is, secession, which is more likely since the breakup of Eastern Europe than before, and which is deeply influenced by both international models (pro and con) and also by whether one's own nation has multiple groups that might pursue similar paths if one secedes (e.g., India). Next, Katz provides only a coda for the Jeff Goodwin-Eric Selbin debate-cum-consensus that "ballot boxes are the coffins" of revolutionary movements. He then redirects that discussion toward issues not directly addressed in the debate. His comments about different degrees of democratization, relative and changing levels of democratization by region, and the vulnerability of democracies to any type of coup or overthrow (N.B.: not just a social-revolutionary one) are interesting but are oblique to the issues Goodwin and Selbin were debating.

Finally, Katz's critical commentary on Jeane Kirkpatrick's "Dictatorships and Double Standards" (Commentary 68 [November 1979]: 34-45) is (unsurprisingly) quite effective, given that her piece was quasischolarly and was meant to promote specific policies rather than attempt to interpret a wide range of cases accurately, as Katz shows she does not do very well. Indeed, she could hardly have done it well, since he contrasts her viewpoint with later events (as he fairly notes), and it is thus tested for prediction, not retrodiction.

In the end, the hidden thematic unity of this likeable yet flawed book lies not in its metaphor of murders and farms but, rather, in its insistence that we view all revolutions and revolutionary movements in an international context, which was, and remains, deeply influenced and altered by ongoing, historically specific events that our theories are not very good at predicting.

British Politics in the Global Age: Can Social Democracy Survive? By Joel Krieger. New York: Oxford University Press, 1999. 232p. \$49.95 cloth, \$19.95 paper.

Andrew P. Geddes, University of Liverpool

National social democracy is dead! Long live global social democracy! This, essentially, is the theme of Krieger's book on the challenges for Tony Blair's New Labour government. The challenges of the global age are fairly clear. Krieger maps his vision of British social democracy in a global age, devoid of its historical agent—the organized working class—and with national sovereignty undermined by the internationalization of the economy and European integration. New Labour has, of course, addressed similar issues, but with markedly different conclusions. Krieger is concerned to locate his analysis squarely in the conceptual foundations of social democratic politics, and from it emerges a clear understanding of the changed structural conditions configuring the political space for contemporary social democratic politics.

The consequence is an important book that adds clarity to the often amorphous notion of globalization; then provides three models of social democratic politics (and shows New Labour to accord with none of them); and then examines the effects of foreign direct investment, the reorganization of production, European integration, and the "unmaking of the English working class" on British social democratic politics in a global age. The book's conceptual and theoretical rigor, combined with its concern to analyze the effect of changed structural conditions on social democratic politics, serves as a

useful antidote to the journalistic obsession with "the Blair effect" and the ubiquitous spin doctors.

Krieger's vision of global social democracy has four key elements. All jar with New Labour orthodoxy and would make uncomfortable reading for New Labour's inner circle. First, whereas New Labour's electoral coalition rests on the shifting sands of "middle England" (guided by the quest for a second term in office), Krieger advocates a more direct appeal to core social democrat constituencies via the recollectivization of labor and the development of wage-earner feminism. Indeed, as Krieger notes, it can be hard to identify the social democratic nature of either New Labour's electoral coalition or their appeal to it.

Second, in contrast to Blair's "third way," Krieger postulates a "solidaristic and egalitarian post-Fordist alternative." "To the barricades in defense of a solidaristic and egalitarian post-Fordist alternative" would hardly be much of a rallying cry. The jargon can sometimes disguise the political significance of the issues being addressed. What is of particular importance within the book's rich analysis of the changed organization of production and the effect of foreign direct investment is the attention paid to the role of women in the workplace and the critical nexus among work, family, and social policy. This prompts identification of the anomalous—in the context of the European Union—absence of state-provided child care for working mothers. The British have one of the highest rates of female labor force participation and a dismal child care record.

Third, Krieger argues that New Labour's institutional orientation marked by constitutional reform should be accompanied by economic and political integration in the European Union with membership of the single currency. Devolution to Scotland and Wales (and perhaps to Northern Ireland, but do not hold your breath) is viewed as the most radical component of New Labour in power. Indeed, it is seen as standing in marked contrast to the right-wing communitarianism of New Labour social policies. Yet, even this concern to devolve and decentralize has encountered difficulties, albeit occurring after this book was written. The travails of the Welsh assembly (the New Labour nominee for First Minister was removed after less than a year in office) and the London mayoral shambles (Ken Livingstone defied the party's electoral stitch-up to run as an independent) give the impression that New Labour's "control freak" tendency makes it hard to come to terms with the reality of devolved power. Maybe because of the grim memory of John Major's absence of control.

European integration is perhaps a more problematic aspect of the analysis. Krieger's call for deeper integration appears to view European unification in terms of a rather bland teleological, federalizing progressivism. This despite the disciplinary effects of EMU, the downward pressure on social expenditure caused by the growth and stability pact, and the EU's democratic deficit. Yet, the ascendance of center-left governments across Europe and the EU's marketoriented ethos could offer a propitious moment for marketfriendly New Labour to engage more deeply with the "European project" (if only sterling were not so strong and the Euro so weak). A more minor point, although something of an irritant for a Euro-pedant such as this reviewer, is the frequent reference to the nonbinding Social Charter; presumably Krieger means the legally binding Social Chapter of the Maastricht Treaty, from which the Conservatives opted out and into which New Labour opted.

The fourth element of Krieger's model of global social democracy stands in stark contrast to Blair's moral mission and Christian socialism (mocked as the Reverend Blair in the

satirical magazine Private Eye). Instead, in what I consider the most interesting section of this challenging book, Krieger argues for the development of a politics of recognition to connect identities and interests in a multinational and multiethnic Britain and within a multicultural EU. He develops Gellner's ideas about modular politics to argue that, rather like pieces of furniture, identities can be assembled, reassembled, and amended. This leads to both an identificational modularity and a modularity in repertoires of political action (depending on which identity is used). The problem with this kind of analysis is that it gives the impression that the "British/English/Scottish/black/Asian/whatever" will encounter huge existential crises before they can even get out of bed in the morning. Yet, what it does demonstrate very clearly is that the shifting sands of social solidarities and collective identities no longer give reliable settings from which politicians can set their compasses. The book also demonstrates the long-term social and economic disadvantages of Britain's ethnic minorities and the challenge they pose to an ostensibly social democratic government. It might also have been useful if the book had demonstrated the overwhelming loyalty of Britain's ethnic minority electorate to the Labour Party and how this support has in many ways been taken for granted. Indeed, in Manchester, where Krieger analyzes the Pakistaniorigin population, disputes over selection of candidates for local and national office have provoked significant strife within the Labour Party.

This book is an important and enriching contribution to the analysis of British politics. It eschews the language of "no alternative" to argue that in a global age New Labour can and should seek to craft a distinct form of social democratic politics equipped for a multinational and multiethnic Britain. It deserves to be widely read.

Tocqueville's Revenge: State, Society, and Economy in Contemporary France. By Jonah D. Levy. Cambridge, MA: Harvard University Press, 1999. 386p. \$55.00.

John S. Ambler, Rice University

In this thoughtful, carefully researched study of recent attempts at French economic reform, Jonah D. Levy has some important things to say about basic issues in two fields of research: economic policy and social capital. The central question posed is why decentralization reforms of the 1980s and 1990s have had such meager effects on local economic development. The principal explanation is that reform policies failed to create the resources and incentives needed to promote effective action by local officials and private firms. This theme is developed in careful examination of the effect of decentralization on economic development in two municipalities—Besançon and St. Etienne. In a penultimate chapter, the author argues that the same pattern of reform foiled by a weak civil society ("Tocqueville's revenge") is seen in the fields of industrial relations and financial institutions. The final chapter examines the means by which policies followed in Japan and Germany succeeded in enlisting the support of private groups and associations.

Levy's account of the rise and demise of French dirigisme is a reminder of the fragility of popular economic models in the postwar world. In the 1960s and early 1970s, in the midst of the French economic miracle, observers such as Andrew Shonfield (Modem Capitalism, 1969) admired the Gallic model of state-led economic growth, with its focus on planning, national champions, and economies of scale. By the late 1970s, Levy reminds us, state intervention had come to mean protection of jobs, even at the cost of subsidizing industries

destined to decline. Dirigisme had one last fling in the socialist experiment of 1981-83, before President Mitterrand and his advisors concluded that the long-term success of the Socialist Party required that it prove its competence in managing the economy by loosening state controls. What followed, Levy argues, can be characterized as "associational liberalism," whereby public oversight of economic development progressively devolved to local and regional governments. Yet, decentralization reforms left in place more than 30,000 competing municipalities, a tax structure that gave local governments very limited autonomous resources, and serious confusion over the relative authority of regions, departments, and municipalities. The most common results were wasteful competition among municipalities for new investment, failure to enlist the cooperation of businesses, and, eventually, the reappearance of direct state subsidies to firms.

One of the book's most important contributions is the weight Levy lends to the institutionalists in the debate over whether social capital should be treated as an endogenous or exogenous variable. As do Tarrow and Jackman and Miller, he argues that the strength of local governments and of private associations is in good measure the result of public policy (Sidney Tarrow, "Making Social Science Work Across Space and Time: A Critical Reflection on Robert Putnam's Making Democracy Work," American Political Science Review 90 [June 1996]: 389-97, and Robert W. Jackman and Ross A. Miller, "Social Capital and Politics," Annual Review of Political Science 1, 1 [1998]: 47-73). Unlike Germany—where the cooperation of private and local institutions was supported by federalism, "codetermination" with labor and business, and tax laws that encouraged banks to make long-term commitments to firms—and Japan—where economic policy was formulated and promulgated within the "iron triangle" of business, bureaucracy, and the LDP, with the help of broad networks of suppliers and manufacturers (the keiretsu) -France did little to strengthen local and private institutions in preparation for decentralization, deregulation, and privatization.

Tocqueville argued forcefully that the weakness of French local governments and private associations can be attributed, in large part, to the determination of rulers in Paris, from the old regime onward, to squelch potential opponents in local government and civil society. If one must agree with Tocqueville and Levy that policy has a powerful effect in the long term, there remains the question of how reformist governments can strengthen civil society in the face of powerful resistance from traditional institutions and deeply seated attitudes. As Levy is aware, the decentralization laws of the early 1980s likely would not have been passed had they included forced amalgamation of France's 30,000 municipalities. If the Auroux Law, which created workers' councils, failed to incorporate trade unions, was this not at least in part because the largest union—the communist-led General Confederation of Workers-still suspected that the proper goal was to replace capitalism, not improve it? One partial answer to the "institutions versus culture" debate lies in the time perspective: In the long term, the strength of civil society is powerfully shaped by incentives and disincentives created by public policy. In the short term, deeply entrenched institutions and attitudes may be highly resistant to change, even in the face of reformist governments.

The author offers impressive evidence of the failure of French associational liberalism, at least at the micro level. Clearly, France still struggles to find a stable middle ground between dirigisme and what in France is known as Americanstyle "hyperliberalism." Yet, the presumed weakness of civil

society must be placed in comparative perspective. With its multitude of voluntary associations and modern, efficient firms, France falls closer to Sweden than to Russia on the strength-of-civil-society scale among democratic countries. Moreover, weaknesses have appeared in both of the national models that are suggested as superior to the French. In the 1990s, the Japanese iron triangle produced cronyism, corruption, and recession. The powerful role of banks in controlling German firms now is perceived by the Schröder government as a source of economic stagnation. Even in the United States—Tocqueville's model of a strong civil society—states have engaged in the same type of wasteful competition for industrial investment that Levy deplores in France (Paul Brace, State Government and Economic Performance, 1993).

This is not to suggest that the relationship between civil society and economic growth is unimportant, only that it is complex and subject to change. Whatever the weakness of French civil society, it seems hardly to have destroyed the French economy, which achieved growth rates significantly higher than the EU average in the 1970s, dropped slightly behind from the early 1980s to the mid-1990s, and then emerged as the leader among major European economies in the late 1990s. Although France still has an unemployment rate higher than the European average, it also has a large trade surplus and a level of labor productivity higher than that of the United States. At least at the macro level, "Tocqueville's revenge" seems less than complete.

Values and Political Change in Postcommunist Europe. By William L. Miller, Stephen White, and Paul Heywood. New York: St. Martin's, 1998. 460p. \$75.00.

Vicki L. Hesli, University of Iowa

Miller, White, and Haywood have compiled an exhaustive report on coordinated public opinion surveys conducted in five East European countries. Although most of the surveys were completed in 1993, the underlying value patterns that are identified provide a concise, accurate, and enduring picture of postcommunist political culture. Critical aspects of this political culture include a commitment to equality and state welfare as well as a tenacious but not overly pervasive anti-Western nationalism. These values exist alongside a commitment to populist values and a syndrome of liberalism that includes respect for citizen rights, tolerance for minorities, and a desire for limited/constrained government.

The preface and chapter 3 provide an overview of the methods and organization of the surveys as well as a discussion of the major fault lines that are assumed to divide the publics of Russia, Ukraine, Hungary, Slovakia, and the Czech Republic. The core of the book is devoted to an evaluation of four broadly defined and appropriately subdivided political values: socialist, nationalist, liberal, and democratic. Subdivisions include a careful delineation among external nationalism, centralist nationalism, and cultural nationalism.

The initial presentation of values tends to be overly descriptive, as it relies too heavily on cross-country comparisons of aggregate percentages of support for (or lack of support for) the different value packages. No explanation is provided as to how or why a particular set of values came into being or what significance the different value packages may or may not have for the future of these countries. Most critically from a social science perspective, countries and other sociodemographic subgroups are compared without conducting statistical tests for significant differences across the means of the subsamples. The rough dichotomization of the continuous variable scales is frustrating. Another short-

coming is that composite indicators of values are constructed from items registering low levels of internal reliability (the set of liberal values, for example, has little unity). Thus, the researchers' views of what should and should not characterize value coherence is driving the study, rather than an exploration of the possibility of unanticipated cognitive structures.

This analytical choice contributes to conceptual ambiguity. The authors use the words "sophistication and maturity" (p. 191) to describe a politician's understanding of his/her dual role of both defending and criticizing the state. Yet, "coherence of opinions" is later taken as an "index" of political sophistication (p. 213). In addition, most measures used in the surveys are not only thorough but also innovative (e.g., a question about a personal collection of books is used to supplement the traditional measure of educational level), but some measures still require further extension. The frequency of attending worship services is not a good indicator of the strength of religious identification in the post-Soviet setting.

I also have a few questions about the historical-cultural overviews. In chapter 1, for example, the authors state that the communist regimes of the Soviet Union and Eastern Europe were "committed to the gradual elimination of religion" (p. 38). Yet, except for widely publicized campaigns, the Soviet regime more often turned a blind eye to the continuation of private religious practices and arguably even promoted Orthodoxy during the Great Patriotic War. Another question arises with regard to the typology of political change from below (such as Solidarity in Poland) versus change from above (as by party reformers in Bulgaria) presented in chapter 2. The implication is that the USSR experienced change from above (i.e., initiated by Gorbachev), but clearly Gorbachev had no intention of ending communist rule, and the failure of the economy, which quickly alienated the public, can hardly be categorized as a change from above. In general, the overview of the collapse of the Soviet Union is superficial and lacks adequate references to the work of other scholars who have addressed this

Overall, the important intellectual contributions of this volume by far outweigh any minor quibbles. Concrete evidence is provided to support several important conclusions. With regard to the past, "dissatisfaction with postcommunist regimes extended far beyond purely economic dissatisfaction" (p. 105). Membership in the former communist parties tended to be unrelated to beliefs in socialist values, so membership must be interpreted as a career decision rather than as a value choice. With regard to the present, the discussion of the language, land, and culture divide in Ukraine is meticulous and serves to confirm existing scholarship. Clarifications are also offered of the often confusing correlation between leftist ideology and nationalism in Russia and rightist ideology and nationalism in Ukraine. Other important clarifications include evidence of the relationship between authoritarian values and support for the progovernment party Russia's Choice, as well as evidence that the strong showing of Zhirinovsky's Liberal Democratic Party in the 1993 elections occurred as result of strategic voting by opponents of the regime.

Particularly significant are the distinctions drawn between members of parliament and their respective publics: MPs are "much less committed to socialist values and much more committed to market principles than their publics" (p. 185). MPs are also more committed to electoral principles of representative democracy (p. 211). The implication is that the political leadership was (as of early 1993) the catalyst behind reform efforts and was, in fact, often operating at odds with

the wishes of the people.

Support for private business (rather than state control) is weak throughout the region, but this should not be confused with a lack of support for democratic values. Economic losers tend to be more committed to socialist values, which implies that these values could wane with economic prosperity. In a related and powerful finding, the authors report that opposition sentiment (to the then current government) within each country was dominated by economic pessimism. Also related is the finding that "Russian MPs with socialist values tended very strongly to have nationalist values" (p. 218). To me this implies that socialists still feel threatened by capitalist encirclement. This means that the continuing danger of Western domination actually serves to maintain, into the present, a strong legacy of the communist past. Overall, this study clearly demonstrates that, whether as a result of capitalist encirclement or continued economic depression, commitment to the ideals of communism is not declining but is increasing in the post-Soviet setting.

Moderate and Radical Islamic Fundamentalism: The Quest for Modernity, Legitimacy, and the Islamic State. By Ahmad S. Moussalli. Gainesville: University Press of Florida, 1999. 250p. \$49.95.

Mehran Tamadonfar, University of Nevada Las Vegas

Since the Iranian revolution of the late 1970s and the subsequent rise of Islamist extremism, much has been written on Islam as an ideology and its growing regional and global significance. Yet, very few scholars attempt to link the basic premises of Islamic fundamentalism/"Islamism" with those of pluralism and democracy, as Moussalli does. This is a wellresearched and analytical study of contemporary Islamist thought on such major issues as community, state, ideology, politics, legitimacy, modernity, and science. By relying on a textual analysis of the main works of such thinkers as Hasan al-Banna, Sayyid Qutb, Hasan al-Turabi, and Rashid al-Ghannushi, the author presents a systematic, analytical, and relatively broad discussion of the philosophical underpinnings of the contemporary fundamentalist movements in the Arab world. He underscores the common themes in these perspectives, but he seems to be keenly aware of the divergent, and often contradictory, views on such issues as radicalism, modernity, legitimacy, and democracy. Moussallı suggests that Islamic reformists rely on reason and science to reform Islam. In contrast, the fundamentalists turn to the Quran and Sunnah (the prophet's traditions) in developing either radical exclusivist or democratic-pluralist inclusivist goals and strategies. Moussalli concludes that contemporary Islamic fundamentalist thought generally underscores such doctrines and institutions as tawhid (monotheism), shura (consultation), and yma (consensus). In his view, these doctrines provide the foundations of legitimacy, communal empowerment, democracy, and modernity in fundamentalist thought.

The discussions of Qutb's radical thought, the origins and scope of fundamentalist radicalism, and al-Turabi's notion of individual empowerment are especially informative. Moussalli capably illustrates how these two thinkers, who represent opposite perspectives and differ from mainstream Islamic thought, embrace change and modernity. He accurately and constructively criticizes Western writings that reject the ability of Islam to adapt to modernity and Western pluralism, and he emphasizes the democratic-pluralist nature of shura.

The book fails to address a number of topics adequately and properly, however, and tends to overgeneralize about issues such as democracy, modernity, and legitimacy in contemporary fundamentalist thought. Moussalli's conceptualization of "fundamentalism" is ambiguous and often contradictory. Given its origin and contemporary meaning, the term has very little explanatory value when applied to these thinkers and groups. They tend to refer to themselves as "Islamist," even though that term has its own shortcomings. Moussalli's suggestion that the difference between radical and moderate fundamentalism is simply a matter of method is empirically inaccurate (p. 104). The comparison of Qutb's and al-Turabi's views shows that there are important differences that go beyond method.

Although sporadic reference is made to the two major Shi'i thinkers, Ali Shariati and Khomeini, throughout the book, their ideas are not adequately discussed. Khomeini was the only fundamentalist thinker who succeeded in establishing his own version of an Islamic state, and his thoughts are embraced by the major fundamentalist groups in Iran and the Arab world, especially in Lebanon and the Gaza Strip. An in-depth analysis of Khomeni's thought reaffirms the longheld assumption that many important fundamentalist thinkers do not advocate democracy and modernity. In fact, Khomeini's doctrine of vilayat-e faqih (leadership of the jurisprudent) is clearly elitist. Unlike the thinkers Moussalli studies, Khomeini does not link legitimacy to popular consent and underscores the need for consensus among the clerics. Of course, as a Shi'i, Khomeini cannot "liberate" himself from history, as Moussalli sees in the works of the Sunni fundamentalists. Thus, it would have been useful if the author had paid attention to the influence of sectarian differences on contemporary Islamic fundamentalist thought.

Critical Citizens: Global Support for Democratic Governance. Edited by Pippa Norris. New York: Oxford University Press, 1999. 303p. \$65.00 cloth, \$19.95 paper.

Christopher J. Anderson, Binghamton University, SUNY

Much of what political scientists do can be described as understanding how democracy works and what makes it last. Most would agree that legitimacy is at the heart of a stable democracy. Questions regarding what legitimacy is, how it can be conceptualized and measured, and how it can best be explained have long occupied a prominent place in the discipline. Yet, curiously, the study of why and under what conditions citizens support political institutions, actors, and democratic principles has long remained disjointed. Explanations and empirical tests abound, but few have tried to integrate what we know.

By attempting to take stock of what we know about political support and of the data that exist to study this important concept, Critical Citizens makes a significant contribution to our understanding of citizen support for democratic governance. It tackles the massive literature on political support both in the United States and in comparative perspective. What is more, the contributors analyze support at the individual level as well as cross-national differences; they examine old and new democracies; and they develop and test explanations for changes in political support over time. Critical Citizens is an enormous collective undertaking that produces a rich set of results.

The strengths are several. The book provides a systematic overview of the available survey data that can be used to analyze issues of political support. Moreover, the authors individually and collectively test the most common explanations found in the literature, and they do so from a variety of angles. Also, the book's focus on global coverage allows the authors to test general theories in the most general way

currently possible. Clearly, *Critical Citizens* is a benchmark in the global study of political support.

In addition to these more general contributions to scholarship, the book has some nice features that are useful for a variety of readers. First, it offers an introduction to the field that does a good job of classifying the different dimensions of support and also cleans up some of the clutter in the literature. Second, the chapters are tied together by following a similar framework, which is laid out in the beginning. Third, at the heart of this effort is the recognition that the concept of political support is multidimensional. For an edited volume, *Critical Citizens* is unusually well integrated, and it includes contributions of very high quality that easily could have been published in leading journals.

The book is organized as follows. The first part examines cross-national trends in different dimensions of political support. This is followed by several chapters that test specific theories with the help of crucial case studies. The third section examines specific explanations (political and economic performance, institutions, social trust, and so on) and the extent to which they explain trends in political support in comparative perspective. A conclusion highlights the major

findings.

Part 1 includes chapters by Hans-Dieter Klingemann (global trends), Russell Dalton (advanced industrial societies), and William Mishler and Richard Rose (postcommunist Europe). Klingemann finds that the vast majority of people worldwide support democratic principles and democracy as an ideal form of government. In fact, he reports extraordinarily high levels of support, especially in regions that traditionally have not had institutionalized democracy (such as Africa and South America, where support averages around 85%). The figures are not much lower than in the established democracies of Western Europe, although the performance of democratic institutions is evaluated more negatively in countries that have become democracies more recently. Dalton finds no general decline in support for democratic ideals but an erosion in specific support, such as people's psychological ties to political parties and their trust in political actors.

Taken together, these findings lead to a crucial conclusion that is highlighted repeatedly throughout the volume: The most critical citizens are those who want more, not less, democracy. This stands in contrast to the accepted assumption that dissatisfaction with the performance of political institutions necessarily spells the demise of democracy as a form of government. If anything, the reverse appears to be true. Mishler and Rose, in their chapter on postcommunist Europe, point out that it is difficult to know, of course, what constitutes too low a level of support for a democracy to remain stable. They argue in favor of considering both the level and the dynamics of support, especially in new democracies. Moreover, they point out that it may not be sufficient simply to compare how closely current practices approximate ideals; it also may be necessary to invite people to compare the current system with other actual systems (such as Sovietstyle communism).

In Part 2, Soren Holmberg (Sweden), Dieter Fuchs (Germany), and Richard Rose, Doh Shin, and Neil Munro (South Korea) examine particularly interesting cases that help illuminate different aspects and explanations of political support. Holmberg reports that, compared with the other Scandinavian countries, Sweden has had a much more drastic downturn in political trust and party identification over the past three decades. What explains this unique pattern? He attributes it mainly to differences in political performance. Fuchs, in a conceptually very sophisticated analysis aimed at

examining the congruence of a country's democracy type and people's underlying values, compares East and West German attitudes about government. He makes a compelling case that political support is lower in East Germany, mainly because of a different conception of the ideal democracy. The East Germans favor a socialist democracy, but the fall of the Berlin Wall brought a liberal democracy. This stands in stark contrast to the West Germans, who prefer a liberal democracy and whose values and institutions are thus congruent.

Part 3, which deals with explanations of trends, addresses the relationship between social and political trust (Ken Newton), economic explanations of trust (Ian McAllister), political performance explanations of trust (Arthur Miller and Ola Listhaug), the role of institutions in explaining trust (Pippa Norris), and how changing political values affect people's attitudes toward democratic government (Ronald Inglehart). These chapters demonstrate the wide and creative range of explanations for variation in trust across individuals, countries, and time. Newton reports that political trust appears to be fundamentally different from social trust. Moreover, he finds the latter is actually on the rise across many democracies (with the possible exception of the United States), and political trust fluctuates more than social trust. Perhaps most important, social trust does not seem to translate easily into political trust. McAllister seeks to debunk a common explanation of trust—objective government performance in the form of economic conditions, social indicators, and political performance—and finds that these factors are important, but they have less substantive influence than political culture and historical circumstance. Miller and Listhaug differentiate between the outcomes political systems generate and the political process by which they do so. Their analysis suggests that fairness in both process and output matter to citizens. Thus, not just what governments do, but how they do it, matters. This conclusion ties in nicely with institutional explanations of political support, a question Norris takes up. She finds that institutions (the rules of the political game) matter: Strong institutional guarantees of democracy, moderate multipartism, and majority electoral systems all produce higher support for political institutions. Inglehart links up transformations in people's political values with the study of trust. Specifically, he reports that postmodernization has led to a decline in support for authority but an increase in support for democratic values. Thus, as do Klingemann and Dalton, Inglehart makes the point that trust is lowest among those who want more, not less, democracy.

Overall, the volume is useful for those who want a general and up-to-date overview of the comparative literature on political support, on the available data sources, and on the general state of theorizing in this area. It marks the long road we have traveled and illuminates some of the areas to which we have paid less attention over the years. To be fair, the volume's main purpose is not to break new theoretical ground. Instead, like Russell Dalton's Cittzen Politics (1996), it provides a rich treasure trove for future analyses by mapping the boundaries of where we are. The paperback version is very affordable and is thus ideal for classroom use.

What do we learn? Not all citizens have to support all levels of the political system in order to ensure its stability or legitimacy. In fact, what Klingemann labels "dissatisfied democrats" seem to be the best insurance for a stable democracy. In the current era of global democracy, people support democratic values and principles, but they pay close attention to how well current political performance approximates the ideal. Instead of providing unquestioning loyalty, the critical democrats help democracy flourish by being vigilant. The contributors to Critical Citizens reach a sanguine

conclusion: There is little sign of a crisis of democracy. Moreover, they remind us that democratic legitimacy can only remain high when the gap between the ideal of democracy and how it actually performs is sufficiently narrow.

Nature and Nationalism: Right-Wing Ecology and the Politics of Identity in Contemporary Germany. By Jonathan Olsen. New York: St. Martin's, 1999, 326p. \$15.95 paper.

Peter H. Merkl, University of California, Santa Barbara

Obviously, the topic of this book is important, and there is no doubt that instances of a right-wing ecology can be found in pre-1945 Germany and again since the 1970s. How to define it and the related concepts properly, and hence how to classify and analyze these complex phenomena, however, remains problematic. This book is an ambitious and serious effort, and Jonathan Olsen presents a number of sound and poignant theoretical analyses. But in the end, for lack of a rigorous definition of such terms as "nature," "environmentalism," and the "radical right," the quarry threatens to escape his grasp.

The problems begin with the looseness of language common to German and English; words like "nature," "natural." and "environment" are used in contexts far different from ecology: The nature of Dewey's philosophy, naturally, may be related to the environment in which he grew up. Many of the quotations collected by Olsen from allegedly environmentalist writings and programs of known right-wingers leave doubts. For example, to say that the radical Right expresses the popular fear of "pollution" of the "purity of the Germany body politic" and responds with hostility toward immigrants and multiculturalism (p. 157), or proposes as a solution "a return to nature and her purported laws" (p. 160), seems at first blush tautological or simply right-wing boiler-plate. It hardly signifies, as the publicity for the book asserts, "that parties of the radical right are moving environmental themes to the center of their political programs." We have to define terms like "nature" and question whether this kind of rightwing ecological rhetoric is truly nature-centered or is just nationalistic or ethnocentric. What is environmentalist about "ethnopluralism" or hostility to foreigners?

The author deserves credit for casting his net wide enough to include manifestations of ecological rhetoric in the Nazi regime and its voelkisch literary antecedents. He gets onto thin ice, however, when he seeks antecedents in the nature worship of nineteenth-century romanticism or in every movement critical of Enlightenment universalism unless he can demonstrate that they were also considered on the radical Right in their day. The Enlightenment came in for much criticism from religious and left-wing circles after the French Revolution. With some figures, of course, Olsen succeeds, and the Third Reich did enact massive protection of nature legislation. Yet, there is little compelling reason to consider Heimatschutz (protection of homeland) movements as environmentalist just because they vaguely include nature and landscape among the local features they vow to protect against threats from the outside, before and after World War I, especially refugees and Slavic minorities. Heimatschutz and Naturschutz (protection of nature) are not the same. To define the topic well, we need to narrow the choice to the truly influential combinations of environmentalism and radical Right politics among the multitude of offbeat cults and gurus of every description roaming Germany at that time.

The reawakening of political environmentalism in the 1970s influenced all West German parties, even the radical Right, although its commitment to a nature-centered view

rarely went far beyond lipservice. The Greens were very heterogeneous and included some former Nazis, and "browngreen" gurus, and not a few closet bourgeois nationalists. But they also felt rather distant and alienated from the world of parties and elections, and they only reluctantly formed the required common consensus for political action. For nearly a decade, different and mutually exclusive environmentalist conceptions prevailed among the (mostly red-green) Greens, but it is misleading to attribute the dissension mainly to a kind of missing link at the "metapolitical level" between them and the writers of the new Right, or the more environmentally inclined among them. New Right figures shared the antiimmigrant, antiasylum-seeker attitudes of the moderate Right, particularly the Christian Democratic Union. Olsen's choice of who belongs to the new Right is rather idiosyncratic, and his lumping together of the radical and moderate Right is dubious at best. The confusion mars especially the last quarter of the book, in which the author becomes so absorbed with the German radical Right and antiimmigrant actions of the government that he seems to forget right-wing environmentalism.

Even the examples of Christian Democratic actions against foreign resident cultures seem poorly chosen. A Berlin municipal attempt to ban cookouts by foreign residents in the Tiergarten park on grounds of trash and air pollution is reminiscent of the ban on open fires in environmentally conscious American cities. And a Bavarian government edict against the excessive noise of prayer calls at mosques reminds me of court cases to force Christian churches to curb their bells. It is true that the German preoccupation with noise as a form of environmental pollution may seem exotic to Americans, but are these—and the German devotion to natural foods and health cults—really compelling examples of radical Right environmentalism?

In sum, this book disappoints the reader who expects profound revelations about the secret nexus between environmentalism and radical Right thinking in Germany. It is undeniable that Olsen finds isolated writers and ideas representing both, but the demonstrable connections seem to consist mostly of the dross of right-wing propaganda verbiage. In the world of political reality of mass politics, the overwhelming evidence is still that of two separate movements, nature-centered environmentalism and ethnocentric nationalism, new and old.

Banking on Privilege: The Politics of Spanish Financial Reform. By Soffa A. Pérez. Ithaca, NY, and London: Cornell University Press, 1997. 190p. \$35.00.

Richard Gunther, Ohio State University

This very important book deserves more attention than it has received. It addresses a set of issues of great importance in this era of "liberalization" and economic reform. And it is based upon solid scholarship and a thorough examination of Spanish banks and credit policies over the past century.

Pérez focuses on two key episodes of economic policy change in Spain. The first occurred in the early 1960s, with the great shift from corporatist autarky to policies intended to integrate Spain into world markets. The second occurred during the 1970s and featured abandonment of the interventionist policies that had been used by a powerful planning bureaucracy to guide Spanish economic development during the 1960s. Both are commonly referred to as examples of "liberal" reform, yet they subtly differed from one another, and they had profoundly different implications for the Span-

ish economy, society, and political system. Indeed, one of the broader lessons that can be drawn from this fine piece of scholarship is that generic terms like "reform" and "liberalization" can conceal a great deal of variation. Pérez goes beyond such superficial labels to identify the key actors, their objectives, their strategies, and the important macroeconomic consequences of implementation of these strategies. She concludes that it is an error to assume that such processes can be adequately explained as if they were direct products of inexorable global forces and international market pressures. She convincingly demonstrates that domestic social, political, and economic processes have an important influence on how seemingly global trends unfold in any given country.

The key actors in this drama are the Big Seven banks of Spain, in cooperation with a group of economic "reformers" trained in the Research Service of the Bank of Spain under the Franco regime. Pérez traces the origins of the banking oligopoly back to the early twentieth century and carefully documents how dominant it had become: By 1957, for example, the Big Seven held 72% of total bank deposits. A second set of key actors appeared on the scene in that same year, and by 1959 they had secured sufficient control over the Franco regime's economic policy processes to launch the Stabilization Plan that dismantled corporatist autarky and integrated Spain into the world economy. But these neoliberal technocrats, most of them belonged to Opus Dei (the elitist Catholic lay organization), were more diverse than they appeared to most outside observers. Initial leadership fell to the development planners, led by Laureano López Rodó, and a series of four-year plans helped spur an unprecedented decade of economic growth. They were interventionists at heart and used the apparatus of the state to reach an initial accommodation with the big banks that both preserved their oligopoly and kept credit rates low. These cheap-credit policies had two purposes: Stimulate investment in selected areas, and preserve social peace in the aftermath of an unprecedented wave of strikes and labor mobilization that emerged in reaction to some of the harsher aspects of the initial period of stabilization.

This neoliberal technocratic elite included a tightly knit faction of "reformers," who emerged from the Research Section of the Bank of Spain. They were, by ideological conviction, opposed to state intervention and policies designed to keep the cost of bank credit low. With the fall from grace of the planners, the reformers progressively assumed control over the formulation of economic policy, despite temporary setbacks, such as Franco's blockage of a proposed tax reform in 1973.

These reformers retained control over economic policy following the transition to democracy and the coming to power of the Unión de Centro Democrático (UCD) in 1977. But democratization created a new set of opponents to the reformers; the "politicians" surrounding prime minister Adolfo Suárez were much more concerned with stabilizing and consolidating the new democracy than they were with liberalizing the economy, and they saw looser monetary and fiscal policies as a means to ameliorate social tensions at a time of worldwide recession. This set up a head-on conflict between Suárez and the politicians, on the one hand, and the banks and central bank reformers, on the other. The prime minister intensified this conflict when he attempted to break the monopoly power of the Big Seven by opening up the country to foreign banks. Although the government issued a decree to that effect in 1978, Suárez and his collaborators were forced to include provisions that "imposed such heavy restrictions on [foreign bank] operations that it made it impossible for them to exert the competitive pressure that would have tangibly changed the credit conditions faced by Spanish businesses" (p. 127). In the end, Suárez effectively lost this battle, as well as control over his party. Indeed, he attributes much of the blame for his fall from power in 1981 and the ultimate collapse of his party to the animosity of the banks that his market-opening initiative provoked.

The most surprising development occurred following the election of a majority socialist government in 1982. The Partido Socialista Obrero Español (PSOE) had, as recently as 1978, called for nationalization of the banking sector. Yet, when it came to power, it appointed to the key economic policymaking positions the same central bank reformers who had emerged in the Franco era. "These appointments not only affirmed the policy leadership of the central bank but established it in a more unequivocal fashion than ever before.... The identification between these new cadres [heading the finance ministry] and the central bank . . . was so strong that one can speak of a veritable colonization by that institution of the upper ranks of the economic policy bureaucracy" (p. 138). They continued the 1970s policy of deregulated credit, combined with an accommodative partnership with the big banks. Indeed, the socialist government not only allowed the Big Seven's oligopoly to continue but also took steps to preserve that position until well into the mid-1980s, continuing to impose sharp restrictions on the ability of foreign banks to compete and strongly protecting the banking sector for seven years from the effects of European Community membership (while subjecting other economic sectors to the full blast of EC competition).

The consolidation in power of these reformers had several negative effects on the Spanish economy and politics, aside from the increased conflict inside the UCD noted above. By eliminating the credit controls that had enabled the interventionist planners of the Franco regime to keep real interest rates low during the highly expansionist 1960s, while at the same time preserving the oligopoly of the Big Seven, the neoliberal reformers made it possible for the banks to increase real credit rates drastically, which guaranteed for themselves profit margins that were much higher than for banks in other European countries. Maintaining tight-credit policies in the aftermath of the twin oil shocks of the 1970s, as well as during the early stages of the restructuring of heavy industry and the parastate sector initiated by the PSOE in 1983, moreover, plunged the country into a protracted recession, and unemployment rose to more than 21%. Only European Union integration put an end to these harsh economic circumstances. In the meantime, electoral support for the socialists and even the organizational basis of the PSOE were damaged by the political fallout.

This book has several important implications for studies of political economy, especially the effect of economic policy on politics. First, it is a mistake to take such catch-all terms as "liberalization" and "reform" at face value. It is necessary to break down these generic concepts into their components and examine their separate effects on politics and the economy. Indeed, the "liberal" policy of deregulating credit was accompanied by the preservation of a very imperfect market structure, in which seven banks controlled more than 70% of bank holdings as well as 70% of the capitalization of Spain's unusual stock market. Thus, as Pérez demonstrates, credit deregulation combined with oligopolistic control of financial and capital markets led to high rates of interest that exacerbated a long recession, increased social tensions, and contributed to the erosion of working class support for the socialists.

Second, this book suggests that the rhetoric (if not the

ideological commitments) of economists ought to be more critically examined in terms of whose interests are being served by a particular set of policies. The central bank reformers projected an image of "virtually unquestionable expertise" (p. 139), and disparaged alternative cheap-credit policies as irresponsible and demagogic preferences of "politicians," but they never discussed the dramatic incomeredistributive consequences of such policies, which enormously enriched the banking oligopoly. These implications suggest that political science might benefit from the rebirth of a "sociology of economic knowledge."

Finally, Pérez concludes that the seemingly worldwide trend toward liberalization of economics does not necessarily imply that global economic forces constitute an adequate explanation for these developments. Domestic social, political, and economic factors may lie at the heart of the way in which "liberalization" unfolds in a particular country, and these national differences may have more substantial social and political influence than the global trends themselves.

The only shortcoming of this book is that, even though it is well written, the narrative is often exceedingly dense, and its vocabulary and excessively succinct invocation of complex economic concepts may make it a difficult read for those not deeply emersed in the political economy literature. Nonetheless, it is a fine piece of scholarship that makes an important contribution. It also provides an important missing link that helps make sense of previously unsolved puzzles and anomalies concerning the Spanish transitions from authoritarianism and corporatist autarky to democracy and a market economy integrated into the European Union.

Third World Environmentalism: Case Studies from the Global South. By N. Patrick Peritore. Gainesville: University Press of Florida, 1999. 328p. \$49.95.

Kathryn Hochstetler, Colorado State University

A major debate about environmental politics asks about the sources and nature of environmental attitudes: Which individuals or groups of people place a high value on the quality of the natural environment, and why? How do those environmental values map onto other political and cultural values? The survey-based studies by Ronald Inglehart (The Silent Revolution, 1977; Culture Shift, 1990) have provided a prominent (and much debated) set of answers to those questions: Affluent individuals and nations come to hold environmental values as part of a whole set of postmaterial values related to quality of life and personal expression issues. Other sociological and economic perspectives (pp. 30-1) also argue that environmental concern comes only after economic needs are met. Such assertions have a hard time accounting for the emergence of environmental values in what Peritore calls the Global South.

Peritore provides new evidence on the existence and nature of environmental values among the environmental elites of the Global South, identifying seven clusters of environmental value profiles that are present in varying combinations in Brazil, India, Iran, Korea, Mexico, Puerto Rico, Romania. These seven countries are not representative of the Global South in any systematic way but do cover quite a bit of the globe, although no African cases were completed. A chapter is devoted to each of the seven, with sections that summarize their major environmental problems and policies in addition to Peritore's new data on environmental attitudes. In each country, Peritore and/or his research associates applied a Q-method protocol to elites in business, government, and environmental groups. The Q-method is explained

in the first chapter, and a 35-page appendix lists all the Q-sort data. Briefly, this somewhat unusual method asks respondents to sort qualitatively derived statements on a given issue—in this case, 241 elites organize 24 viewpoints on the environment—by their degree of agreement with the statements. Factor analysis then identifies enduring attitude types that emerge in the ways the respondents organize the statements.

In what Peritore calls the book's major finding (pp. 12, 243), he documents that postmodern/post-Fordist environmental value types are very strong among many Third World environmental elites. In sharp contrast to the North, that concern is much more likely to emerge as a value on its own in the South, without being linked to the whole package of postmaterial values that Inglehart and others identify. The value analysis shows broad areas of agreement among the various elites, including across sectors, which leads Peritore to suggest that "the environmental new politics could, paradoxically, come more easily in the Global South than in the North" (p. 244). Peritore, as do others who focus on attitudes and values, does not examine the ways that attitudes link to actual behaviors and policies, however, and the many environmental problems and stillborn environmental policies and institutions documented in the country chapters suggest some reasons to be skeptical about his hopeful suggestion.

The seven country chapters are generally successful. Scholars familiar with the environmental politics of individual cases will not find much new in the summaries of environmental problems and policies, but this study offers genuinely new data on elite environmental attitudes, which has been lacking. In addition, few readers are likely to be familiar with the environmental politics of all seven cases. There are inevitably lapses and gaps in a book that is this empirically broad. For example, the discussion of Brazil's environmental problems omits most of its significant urban and industrial problems, and the Iranian chapter is thin in its discussion of environmental politics and policy.

The more serious flaw of the country chapters is that Peritore does not develop the comparisons among the cases as well as he might. His overall aim is to present a composite picture of "third world environmentalism," and he goes so far as to assert that the political culture concept is irrelevant for understanding the development of environmental values in the South (pp. 36, 232). This argument leads him to overstate the similarities among the cases at the expense of their equally clear differences. For example, the attitude types Greens, Sustainable Developers, and Postmodern Managers are strongly present in Brazil, India, Korea, and Mexico but virtually absent in Romania and Iran (although the latter has a few persons who hold Sustainable Development views) (p. 8). The India chapter, which deviates from the others by including quite a bit of country-specific information, shows that the influence of the global economy and international ideas like environmentalism continue to be mediated by national political structures and ideas, rather than obliterating them, as Peritore asserts. Although the overall effort to identify and analyze nonnorthern environmental values is laudable, the attempt to shoehorn so much diversity into a single "third world environment" phenomenon is misplaced.

The country chapters are sandwiched between three chapters that map environmental values onto broader political values. Peritore graphs the attitude types onto two axes, one that extends from modernism to postmodernism, and one that extends from Fordism to post-Fordism. Descriptively, these axes help understand the factorial space occupied by the various attitude types. The overall mapping of attitudes (p. 240) supports Peritore's contention that elites in the

Global South are moving with the North from modernist Fordist attitude spaces to postmodern and post-Fordist spaces—although, as noted above, this generalization overstates the degree of movement in some of the countries. Unfortunately, Peritore also uses these chapters to attack postmodernism as a philosophy, dismissing it in florid terms as "an attitude, a pose, hip sophistry" (p. 22) and "the decay product of avant-guard leftist modernism" (p. 228). Peritore's strongest case against postmodernism is that it cannot make its arguments about the importance of discourse given the "massive biological evidence" of environmental reality (p. 228); the presence of real and direct environmental threats is his explanation of the origins of environmental concern in the South (pp. 30-7). Yet, there is no direct correlation between level of threat and level of environmental values in his study. We are told, for example, that Iran's environmental crisis is among the most critical in the world (p. 209), but in this study Iranian elites are among the slowest to adopt environmental values. Evidently, environmental threats are not only "real" but also interpreted through the values and attitudes that are the subject of this book.

Political Paranoia: The Psychopolitics of Hatred. By Robert S. Robins and Jerrold M. Post. New Haven, CT: Yale University Press, 1997. 366p. \$30.00.

Philip E. Tetlock, Ohio State University

This book offers an insightful and quite compelling blend of psychological, especially psychodynamic, theory and historical analysis. Indeed, many of the historical anecdotes alone more than justify the price of admission. Joseph Stalin's letter of condolence to Eleanor Roosevelt provides a fascinating glimpse into the mind of one of the most influential men of the twentieth century as well as into the quirky psychologic of paranoia. After expressing sympathy, the Soviet dictator went on to imply that FDR had been poisoned and offered his assistance in any investigation that Eleanor might wish to conduct. Robins and Post wrily comment: "Apparently etiquette in Stalin's Kremlin included suggesting the possibility of murder to a grieving widow and encouraging her in finding the perpetrator" (p. 2).

The authors work with a standard, seven-component definition of paranoia, so standard that paraphrases of the definition might well suffice in legitimizing mental-health reimbursements from an insurance company. The definition includes the suspicion, without sufficient basis, that others are exploiting or harming one; preoccupation with unjustified doubts about the loyalty of friends or associates; reluctance to confide in others because of unwarranted fear the information will be used maliciously against one; the reading of demeaning or threatening content into benign remarks; the bearing of grudges indefinitely; low thresholds for perceiving attacks on one's character or reputation; and recurring unjustified suspicions regarding the fidelity of a spouse or sexual partner.

Clinical diagnosis is, typically, an exercise in mapping complex and ambiguous stimuli into fuzzy, overlapping sets. And diagnosis is especially hard when the diagnostician lacks direct access to the assessee, and the assessee is already the target of intense political passions (in the current cases, almost always outrage). Obstacles to the side, however, the authors make a powerful case that a common paranoid streak runs through such disparate political characters as Hitler, David Koresh, Pol Pot, Lyndon Larouche, Shoko Asahara, Idi Amin, Elijah Muhammad, and David Duke. In the process, the book avoids one of the most frequent and often

quite justified criticism of psychobiography, namely, that it falls prey to the post hoc ergo propter hoc fallacy. The authors recognize that a paranoid personality cannot automatically be assumed to be behind every paranoid political strategy or act. Joseph McCarthy does not, for example, fit the prototype well. Of course, skeptics might still insist that Robins and Post implicitly exaggerate the statistical connection between paranoid personalities and acts as a result of cognitive biases, such as hypothesis-confirming search strategies, illusory correlation, and the fundamental attribution error. But these skeptics are likely to be mollified only by the implementation of a double-blind research design in which personality assessors independently rate the life history and personal behavior of a representative sample of political figures, without knowledge of those figures' political actions and without knowledge that hypotheses about paranoia (or any other personality attribute) are being tested.

The authors also recognize that paranoia can, in many situations, be decidedly adaptive. It is no coincidence that paranoia has been called the politician's disease. In an uncertain world, one must balance the likelihood and seriousness of making Type I errors (concluding that trustworthy people are out to get you) and Type II errors (concluding that people who are out to get you are trustworthy). Many politicians believe that the former error is both more common and more serious, so it is prudent to maintain a low threshold for being suspicious of others. To be sure, one could imagine a book that focuses on the opposite error: excessive gullibility, trust, and naiveté. Chamberlain at Munich comes quickly to mind. But I suspect it would be a thinner and less interesting volume.

Although the analytical spotlight is on individual personalities, the authors rightly insist that some social orders are manifestly more receptive to paranoid appeals than are others. In analyzing such diverse cases as the Cambodian genocide and the Salem witch trials, the authors do a fine job of delineating the conditions under which groups are especially likely to become victims of collective paranoid wrath. Collective paranoia needs to be culturally plausible (victims are chosen within a complex of well-established traditions of belief and are chosen only if they possess at least some characteristics that partly fit the profile of the paranoid delusional system) and economically advantageous (victims tend to be chosen from those whose death or humiliation can symbolically or materially enrich the accusers). Once again, there is reason in this madness.

Finally, the authors steer clear, by and large, of arguably the most common pitfall in political-psychological analysis: the tendency to coopt a psychological vocabulary to belittle or stigmatize points of view that one find objectionable. Calling someone paranoid, or a victim of groupthink, or a symbolic racist is not likely to be confused by many for a compliment. Unlike many of their political psychological colleagues in the early 1980s, Robins and Post do not, for example, classify Ronald Reagan as either a paranoid personality or an agitator of paranoia when he labeled the Soviet Union "an evil empire." This is probably wise. Most observers today would deem it a professional embarrassment to label Winston Churchill a paranoid for his prescient characterization of Nazi Germany in 1933 as a "gangster state." But these examples also illustrate the inherent ambiguity and tendentiousness that surrounds attributions of paranoia. Robins and Post define paranoia as extreme suspiciousness of others that lacks any justifiable basis. Assessing the justifiability of a suspicion in any given situation can, of course, be a tricky political as well as psychological judgment call. Rational choice theorists will be inclined to see a prudent trade-off between Type I and Type II errors, whereas psychodynamic theorists will be inclined to see "pathology" and "hiss"

Overall, my differences with the authors are relatively minor. My hunch is that they, at times, may exaggerate the tightness of the statistical connection between paranoid personality and paranoid political action (something only to be resolved through a double-blind design of the sort sketched above). And I am somewhat more inclined to rational-actor interpretations of certain decisions that the authors are inclined to assimilate into a psychopathological framework. Indeed, I wonder whether political leaders who are sufficiently self-aware and socially skilled to disguise their "paranoia" should be placed in the same analytical bin as the criminally insane paranoids who are the bulk of the database for current psychiatric knowledge of the syndrome. But these are differences of degree, linked to methodological style and theoretical temperament. Readers who seek a well-written and thoughtful overview of how paranoia can insinuate itself into the body politic now have a wonderful resource.

Learning Democracy: Democratic and Economic Values in Unified Germany. By Robert Rohrschneider. New York: Oxford University Press. 309p. \$72.00.

Kathleen Bawn, University of California, Los Angeles

Robert Rohrschneider recognized that the natural experiment created by German reunification provided an outstanding research opportunity. He used this opportunity to explore important questions about how citizens' core political values relate to their institutional environment. The resulting research contrasts East and West German attitudes about basic features of democracy.

The theoretical framework juxtaposes two competing perspectives, institutional learning and value diffusion. The former implies that one's political attitudes are shaped by the institutional environment. People who live in well-functioning democracies support democratic values (rights, pluralism, tolerance). People who do not experience successful democratic institutions do not develop these values. The diffusion perspective, in contrast, argues that ideas travel relatively easily from one political system to another, especially given modern communication technology and high education levels. People can (and do) incorporate lessons from secondand third-hand exposure to successful political systems into their own values and beliefs.

Rohrschneider does not see the two perspectives as mutually exclusive. Rather than ask which perspective is right, he focuses on which values are most likely to diffuse across political systems—or at least change quickly in the face of institutional change—and which values will continue to reflect the person's lifelong institutional environment. He argues that, in the context of Eastern Europe, the relevant characteristics are (1) the extent to which the idea requires democratic restraint and self-reliance and (2) whether the idea requires a major or minor revision of socialist beliefs. Ideas that require little of either are most likely to diffuse. Ideas with high requirements on either dimension will be shaped by institutional learning and thus are slow to change. Perhaps a more general formulation of the two criteria would be that values best diffuse when they make relatively low demands on the individual (require little in the way of restraint and self-reliance, to cite but two examples) and when they are relatively easy to reconcile with the overall value system learned from the institutional environment.

Rohrschneider considers five categories of basic values: (1)

liberal-democratic rights, such as the right to publicly oppose the government; (2) democratic ideals, a category that in part addresses the relative importance of fair outcomes (social equality) and fair process (legitimate representative institutions) and that also contains values having to do with representative versus direct democracy; (3) political tolerance; (4) pluralism; and (5) economic ideals, primarily one's attitude toward market competition. He argues that only liberal-democratic rights meet the two criteria for value diffusion; these do not require significant democratic restraint or major revision of socialist beliefs. The other four types of values do not. The overall expectation is that East-West differences will be relatively small on issues of democratic rights and relatively large in the other categories.

This basic hypothesis is tested using both elite data, which Rohrschneider collected by interviewing 168 members (79 East, 89 West) of the Berlin city parliament, and data from several existing public opinion surveys. The quantitative evidence is augmented with extensive quotation from openended interviews with the Berlin MPs. In addition to the basic East-West differences (which are studied for each value category), Rohrschneider looks at mass-elite differences, differences between the pre- and postwar generations, and (less often) differences between the immediate postreunification period (1992) and later (1995). He also considers the degree of difference in many cases, such as whether the gap between democratic rights attitudes of postwar and prewar cohorts is larger in the West than in the East. Institutional learning, Rohrschneider argues, implies that there should be a larger gap, since both cohorts in the East lived under authoritarian regimes, but the data show the opposite: Age and support for democratic rights have basically the same weak negative correlation in both regions, consistent with the prediction that value diffusion should dominate in the area of democratic rights. An important strength of the book is its careful and nuanced documentation of patterns of support for key democratic values in newly unified Germany.

How well do the data fit the theoretical predictions? Overall, pretty well. The evidence is strongest for two claims: (1) There is no systematic East-West difference in support for basic democratic rights, and (2) there is a marked difference in political tolerance. On the first point, at both the mass and the elite level, East Germans show roughly the same support as West Germans for the right to demonstrate, criticize the government, and freely express opinions. Elites in both East and West are more supportive of democratic rights than their respective mass publics, but neither elites nor masses show a clear East-West difference. Indeed, the numbers seem to imply that the eastern elites are somewhat less supportive of democratic rights than the western elites, whereas the western masses are somewhat more supportive than the eastern masses. (I am forced to say "seems to imply" because the otherwise careful presentation of quantitative data pays less attention to statistical significance than I would like.) On the second point, East Germans are notably less tolerant than West Germans in the sense that a much higher fraction of easterners is willing to deprive disliked groups of basic rights.

The evidence is more mixed with regard to pluralism. The claim that East German elites are less comfortable with the conflict generated by pluralism is supported quantitatively only by a single question, the wording of which Rohrschneider acknowledges to be controversial. A more neutrally worded question shows no difference in the responses of the eastern and the western elites. Moreover, the two mass publics show no difference on either question.

Finally, there are the issues of democratic ideals and economic values. East Germans are notably less supportive

of free markets and more inclined to believe that social equality is key to democracy. Strictly speaking, the data show that the pattern associated with the institutional learning hypothesis is consistent with Rohrschneider's overall framework. But suppose for a moment that the theory is wrong, and these are dimensions on which values diffuse easily. Would we expect the East German public, or their elected representatives, to be indistinguishable from their West German counterparts on such issues as the acceptable level of income inequality, given the notable differences in wealth, income, and employment prospects? Rohrschneider addresses this issue rather late in the book and shows that some East-West differences persist when the individual's perception of the economy and her own prospects are taken into account. But most of the evidence for different economic values and for the role of equality in democratic ideals is presented without these controls. Moreover, on many of the specific questions in the economic values and democratic ideals categories, the gap between elites in East and West is wider in 1995, when the grim reality about the costs of reunification had become clear, than in 1992, when hopes were still high. One might think that, if not self-interest, at least group interest played a role in increasing skepticism in the East about free markets.

Overall, I found the data presented in this book to be extremely stimulating and important for both German politics and the study of democratic transitions in general. Careful documentation of which values have changed quickly and which reflect years of institutional learning is a major contribution. I'do not think this will be the last word on why some values diffuse and others persist, but it will be an important part of future debates.

The Legacy of Human Rights Violations in the Southern Cone: Argentina, Chile, and Uruguay. By Luis Roniger and Mario Sznajder. New York: Oxford University Press, 1999. 384p. \$84.00.

Craig Arceneaux, California State University, San Marcos

Argentina, Chile, and Uruguay emerged from military rule shadowed by the stinging legacy of human rights violations. On the one hand, there was cause for celebration. Democratic institutions were put in place, and the elaborate repressive apparatuses of authoritarianism could now be dismantled. On the other hand, there was cause for concern. As the gravity of human rights abuses under military rule were revealed, pressures for government to confront the perpetrators and for society to assemble some common understanding of the past began to materialize. Precisely why these tasks are paramount issues is a peculiarity of authoritarian military rule itself. To an extent far greater than in other transitions from authoritarianism, governments (and societies) that follow military rule are distinguished by the fact that they must live with their authoritarian predecessors. The terms of this cohabitation thus become integral to the democratic development of the country. Given the recent experience of military rule, threats to reintervene must be taken seriously, and this causes governments and societies to hesitate as they confront the past. At the same time, failure to do so weakens the legitimacy of new democratic institutions presumably based upon truth, justice, and accountability.

Luis Roniger and Mario Sznajder analyze this dilemma, and they do so impressively. Their position is that the past must be confronted in order to aid the healing process of traumatized societies, deter future abuses, open a channel for rehabilitating perpetrators, and allow for an accurate and

agreed-upon assessment of the past (p. 55). After a detailed discussion of each case and the respective human rights policies, the authors find that no country has been able to achieve closure and reconciliation. Politicians, driven more by their fear of democratic reversals than principles of justice, strive to leave the past behind. Individuals within society share the blame. Beyond the threat of reintervention, an environment of socioeconomic instability increasingly pressures them. They fear that inquiries into past human rights violations will weaken the police and security institutions, which would threaten their own personal security. Indeed, Roniger and Sznajder recognize how such concerns contribute to human rights abuses under democracy: "The greater the real or perceived threat of destabilization in these societies, the greater the willingness of the population to support the use of force to keep order and stability" (p. 147).

The problem, as the authors adeptly document, is that without reconciliation and closure, politicians and those in society driven by more immediate concerns find themselves unable to control the return of the past to the public sphere. This occurs episodically as new allegations arise, clandestine torture centers are exposed, hidden burial sites are discovered, and officers make public confessions, or as these same events in neighboring countries or human rights investigations in the international realm find their way across the country's borders. Hence, the democracies of the Southern Cone are doomed to sporadic crises so long as reconciliation remains unachieved.

The discussion of how events in neighboring countries rekindle crises is especially interesting. It points to the fact that repression and the legacy of human rights abuses are just as much regional as country-specific phenomena. This theme resurfaces throughout the book. The authors mention the coordination of repression under the Plan Condor, the fact that most disappeared Uruguayans were murdered in Argentina, and the unifying effect of national security doctrine. Roniger and Sznajder discuss efforts in the democratic era to share government resources or even create international governmental or nongovernmental bodies devoted to the investigation of human rights violations (pp. 121-8). Moreover, they note that human rights policies of the respective countries cannot be viewed in isolation because of the learning process that occurred over time. The Chileans learned from the mistakes of Uruguayans, who in turn learned from Argentine mistakes. This raises an interesting question, since the sequence begins with the country in which the military regime collapsed and ends with the country that experienced the greatest exertion of military control over the transition. If this sequence had been reversed, would Chile be worse off and Argentina better off? Comparison at the regional level with attention to such factors as variations in sequence and transition control is an area for future research.

Much of the latter portion of the book investigates popular culture to assess how the societies of the Southern Cone have processed (or failed to process) the history of human rights violations into their collective identity. Whereas the first part of the book considers the effect of human rights abuses on regime stability, the second part concentrates on society. Noteworthy is the breadth of references to film, theater, and literature as well as the assessment of "official histories," especially in education policy and the "heritage of violence." Indeed, this portion is essential reading for political scientists in order to guard against focusing too sharply on human rights as just a public policy concern. Human rights violations and their legacy have a manifold effect, one that can be accurately assessed only with an interdisciplinary effort, as found in this book. The authors, pooling their respective

specialties, skillfully evaluate legal frameworks and public policy, assess the influence of ideological predispositions and the power balances of political forces, document the status of popular culture, and explore such psychosocial concepts as "collective catharsis," "social trauma," "social disaggregation," and "collective memory." The book is comprehensive not only in subject but also in analysis.

Roniger and Sznajder cannot but end on a pessimistic note. So long as politicians are ruled by political contingency and society is focused on private, individualized concerns, the countries of the Southern Cone will live in the shadow of human rights abuses. But there is room for some optimism if a broader view is taken. The legacy of human rights abuses is but one component in the multitude of issues that comprise civil-military relations, and an approach that places human rights issues in this context can more accurately assess how the legacy will affect future developments. Hence, although President Menem backtracked on human rights, he did maintain control over the Argentine military budget, the redefinition of military missions, and areas of military reform. Roniger and Sznajder are referring only to human rights issues when they speak of turns in the civil-military balance, but the recognition that this balance depends on a number of areas illustrates the complexity of civil-military dynamics. Gains in some areas may be used to shore up authority for exertion of control in other areas. Although a country may fail in the area of reconciliation, its success in preventing future abuses may be determined by factors far outside the sphere of human rights.

Parties, Candidates, and Constituency Campaigns in Canadian Elections. By Anthony M. Sayers. Vancouver: UBC Press, 1999. 254p. \$51.75 cloth, \$19.29 paper.

Frederick J. Fletcher, York University

This carefully researched volume is a welcome addition to the small but growing literature on election campaigns in parliamentary systems. Election studies, with some notable exceptions, tend to focus on individual voting decisions, using national samples. There has been little work on campaigns as exercises in organization, communication, and persuasion, particularly at the constituency level, even though "riding campaigns... are the basis of national elections" (p. 3) in parliamentary systems. The case studies examined by Sayers, although limited to constituencies in one Canadian province and somewhat dated (there have been two federal elections since the 1988 campaign featured in this work), are excellent examples of the use of "thick description" to build an analytic framework. This framework, the hypotheses the author draws from the case studies, and the comparisons he makes with other parliamentary systems should make this volume a useful model for further research. In particular, it provides a benchmark for studies of the effect on campaign practices of the dramatic changes in communication technologies over the past decade. In addition, it provides a sound foundation for work that compares constituency-level campaigns across provinces, with their differing political cultures, and for comparisons among parliamentary systems.

The analytic framework helps Sayers present a detailed portrait of the interaction of local and nonlocal factors in constituency campaigns, with particular attention to the relative influence of national and local party organizations on the nomination of candidates and the nature of campaign appeals. The author employs some fairly standard variables, such as contested versus uncontested nominations, mass versus cadre parties, and the nature of the riding (city,

suburban, rural) and its competitiveness, as well as some more original measures, including type of candidate (local notable, party insider, stop gap, and high profile). In telling the story of seven constituency campaigns, Sayers suggests that the nature of the nomination contest, influenced by the type of party and the competitiveness of the riding, tends to determine the kind of candidate nominated, which in turn shapes both the campaign organization and the nature of the local campaign. This discussion and the chapters on winning and losing campaigns provide an excellent summary of common campaign techniques and their effectiveness in various situations.

Among the important themes running through the analysis is the influence of media attention on local campaigns. The extent to which the competing candidates actually engage in meaningful debate on local issues, for example, appears to be a function of media attention and competitiveness. In constituencies served by major media outlets, the local contests tend to be swamped by national issues, except in some high-profile races, which command major media attention. In suburban ridings, which often lack credible local media, it is extremely difficult for local organizations to run effective campaigns, and most must settle for a campaign that parallels that of the national party. There is more variability in rural constituencies, since the relative presence of local and national media varies from riding to riding. Sayers notes that new communication technologies have had a nationalizing effect on campaigns. It would be interesting, as the author himself suggests, to explore campaigns since 1988, to see whether the Internet and emerging specialty broadcasting services and other new communications technologies have altered this trend.

Of particular interest, given the successful "suburban strategy" of the Conservative Party of Ontario in recent provincial elections, is the one suburban case studied here. Sayers found that this constituency had little sense of community, no credible media to force candidates to engage with local issues or participate in all-candidates debates, and little opportunity for candidates to purchase effective advertising. Spending limits and the poor fit between media service areas and the constituency made advertising too costly for local candidates. It would be reasonable to conclude, on the basis of Sayers's description of Surrey North, that even a "local notable" would have difficulty attracting a personal vote in such a riding. This would mean that an effective suburban strategy would involve heavy television advertising featuring party leader appeals, with little attention to local candidates or issues. Perhaps, however, innovative use of local cable services, telephone canvassing, and the Internet might alter this balance.

Sayers concludes by noting the distinctive nature of Canadian campaigns and suggests that they are an effective adaptation to regional divisions in the Canadian federal system. He observes that the successful national parties in Canada have not developed the mass party structures common in other Westminster-style parliamentary systems but have retained "elements of party discipline and organization not found in the more loosely organized parties of the United States" (p. 215). In Canada, he notes, "the balance of local as opposed to regional or national issues, the role of the candidate and the place of national party platforms are all negotiable" (p. 223). Because the local party associations play an important integrative and representative role, as a result of their jealously guarded control over nominations, the parties are responsive to local variation. Thus, the view of elections as primarily national events is misguided. Although variation in local campaigns is clearly demonstrated here, this hypothesis of its functionality requires further examination. The shifting balance among national, regional, and local campaigns is, arguably, influenced by factors other than relations between national party headquarters and local constituency associations.

The case studies necessarily limit the general applicability of the findings, but the work fulfills its stated goals admirably. It provides a clearer understanding of how parties and elections work in Canada, identifies key variables and assesses their influence, lays the foundation for more representative studies of constituency campaigns in parliamentary systems, and presents provocative hypotheses for further testing. That being said, the book sets out to assess the "democratic nature" of these local campaigns but lacks a clear theory of democracy. It ranks nomination contests in terms of the degree of democracy involved but does not link these observations to any broader concerns about representative democracy. Similarly, Sayers develops a useful typology of candidates and campaigns but does not attempt to link these to "representational styles" in subsequent parliaments. Does the nature of the candidate chosen, the local campaign, or the manner in which the winner campaigned have any influence on parliamentary behavior or public policy? Perhaps this is a question for another study. In the meantime, this book fills an important gap in Canadian campaign studies and provides a starting point for further research.

Democracy in Translation: Understanding Politics in an Unfamiliar Culture. By Frederic C. Schaffer. Ithaca, NY, and London: Cornell University Press, 1998. 168p. \$39.95.

Nelson Kasfir, Dartmouth College

Suppose we reverse our conventional approach to democratization, as Frederic Schaffer suggests in this important, closely reasoned, imaginative, and provocative study. We would need to ask what democracy means to its participants in a specific system rather than whether its practice there can be considered democratic according to external standards. Instead of determining whether the institutions that produce democracy are in place and properly used, or whether these institutions actually promote the ideals considered to be the essence of democracy by Western thinkers, Schaffer develops a sensitively nuanced method to find out what Wolof speakers in Senegal mean by demokaraasi, which he argues is their linguistic equivalent to democracy. His intention is to compare the concepts they associate with democracy to those associated with démocratie by French-speaking Senegalese and with democracy by Americans (pp. 15, 19). The words, he asserts, denote quite different concepts to their speakers. Thus, democracy changes its meaning when it is translated or, more precisely, when it is used by people from another culture.

This book is an inquiry into how political culture shapes democratic concepts, an inquiry conducted primarily through an investigation of natural and ordinary language use. Schaffer's efforts to elicit the meanings intended by ordinary voters are reminiscent of what Max Weber called verstehen. Schaffer's approach provides him with an opportunity to tap a dimension of culture that attitudinal research is unlikely to reach, but it does not allow him to claim that the concepts his informants associate with democracy can be generalized to the language group. Nevertheless, he is persuasive in arguing that comparative cultural research can identify significant differences in the meanings attached to the notion of democracy as it is understood in different cultures. He suggests that these differences are likely to be associated with divergences

in political institutions and political action that are overlooked if we rely on the conventional approach.

Schaffer's central finding is that poorly educated Wolof speakers understand demokaraasi as mutuality, emphasizing consensus, solidarity, and evenhandedness rather than the concepts he takes to be central to democracy, namely, widespread participation in governance, emphasizing meaningful choices, inclusivity, and the relative irrelevance of economic and social inequalities in political participation (pp. 80-5). In demokaraasi, "consensus" means ideally that agreeing among themselves is more important to villagers than individual deliberation. "Solidarity" reflects their expectation of mutual self-help, and "evenhandedness" invokes treating people who occupy the same hierarchical level in the same way. In elections, therefore, villagers are more likely to make their choices on the basis of strengthening community ties and acquiring economic benefits. For example, many villagers or urban residents could agree in advance to vote for the same candidate in order to avoid discord in the village or in return for money, food, or a local public project.

Schaffer argues that these different meanings at the core of demokaraasi stem from ideal responses to economic uncertainty by Senegalese peasants and poor urbanites. As in many other preindustrial societies, customary arrangements in Senegal stress participation in collective insurance to lessen family risk in conditions of great poverty. Schaffer says that demokaraasi entered Senegalese political discourse after 1974, when multiparty elections were adopted (pp. 69, 80). Less educated people modified a notion describing a set of new practices to reflect values in their existing social ideas, their "lived experience," and their "economic predicament" (pp. 75, 76).

How would we know that voters are casting their ballots on the basis of different ideas, and what differences did Schaffer find in Senegal? He restricted his inquiry to Wolofones, but since Wolof is the most widely spoken language in Senegal, the first language of almost half the population, differences are likely to affect both the electoral behavior and the possibility of a fully democratic regime—as that would be understood by Americans or Europeans. Schaffer conducted 78 open-ended interviews with Wolofones, selected from four locations by quota sampling, plus 22 with more highly educated Senegalese Francophones in order to learn what voters intended when they cast their ballots (p. 19). Within this sample, the level of education of the informants decisively predicted whether they understood demokaraasi as involving consensus, solidarity, or evenhandedness or as excluding these concepts (pp. 64-5).

Schaffer also asks whether demokaraasi strengthens or subverts Senegal's democratic aspects (p. 116). Consensus and clientelism may weaken democracy, as understood in the West, by reducing the degree to which election results reflect both individual participation and the inclusiveness of the majority of the population. To the extent that the social solidarity of the poor makes elected officials more accountable, demokaraasi strengthens democracy (pp. 129–30). Although demokaraasi could be democratized, to do so would seem to require more widespread economic security or more French education, both too costly for any Senegalese government to contemplate.

Strictly speaking, Schaffer establishes that some less educated Wolofones attach a different meaning to democracy in ordinary language than Americans express in news and magazine articles or political scientists assert as basic criteria. His point is deeply important, although his comparison is awkward, and he does not provide the grounds for general-

izing his findings about individual Wolof speakers to the whole group.

The author appropriately insists that "the main question . . . is whether . . . [American democracy, Francophone démocratie, and Wolofone demokaraasi] share ideals or standards" (p. 19). But he does not attempt a satisfactory comparison because he employs completely different methods to analyze each notion. He did not interview Americans to elicit their natural language associations with the word democracy. He interviewed some Senegalese Francophones but does not analyze the meanings they attach to démocratie. His careful discussion of metaphors used by Francophone politicians in campaign speeches does not demonstrate ordinary language but, rather, the variety of public political meanings it can sustain.

Schaffer's limited tools do not permit him to generalize the extraordinary differences discovered. Open-ended interviews can reveal unexpected meanings for particular concepts, but not how widely specific meanings are held by a particular cultural group. The author does not show us, perhaps cannot show us, how uniformly Wolofones as a group define demokaraasi as meaning the concepts he has identified. In any case, he pays too little attention to the adequacy of his sample for his conclusions.

These findings, then, are basically exploratory. Nevertheless, the work has profound importance in establishing that democratization will not have the same meanings to people in different places. It will not be possible for anyone considering the meaning of democracy after its institutional transfer to ignore Schaffer's book. His explication of ordinary language to tease out meaning suggests the rich possibilities that await other political scientists interested in the comparative cultural meaning of political concepts, and not just democracy.

Religious Politics in Latin America: Pentecostal vs. Catholic. By Brian H. Smith. Notre Dame, IN: Notre Dame University Press, 1998. 126p. \$16.00 paper.

... Anne Motley Hallum, Stetson University

Brian Smith has written a comprehensive review essay of scholarly literature assessing the Pentecostal phenomenon in Latin America as well as the Catholic response. It is not a pathbreaking book, but it is so useful in its organization and balanced summary of a growing body of literature that it will likely be widely read and cited.

Smith begins simply by acknowledging the significance of the massive growth of Protestantism in Latin America over the last thirty years, particularly the Pentecostal variety, which is the choice of the poor majority. Some observers estimate that if present trends continue, Protestants may outnumber Catholics in fifty years. Even if the movement alows down considerably, however, it has already influenced the culture greatly by introducing new religious choice, especially in Brazil and much of Central America. In the second and third chapters, Smith offers an assessment of Catholicism today and gives reasons for the break-up of the Catholic monopoly after 500 years. The explanation, garnered from numerous case studies, ranges from the negative failings of Catholicism, such as the shortage of priests and pastoral care, to the positive offerings of Pentecostalism, such as its flexibility and spiritual power. Smith also mentions the early, condescending writings of Christian Lalive d'Epinay and Jean-Pierre Bastian, who described the conversions as a phenomenon of the poor seeking authoritarian refuge from the changing world; he quickly follows with a summary of

more recent studies, which conclude that Pentecostalism "is a genuinely popular phenomenon driven by the missionary zeal of its local converts" (p. 26).

The author then lays out three possible scenarios for the future in the emerging shared space of Catholics and Pentecostals: (1) "Mutual Flight from the World" as both groups withdraw from attempts to respond to urgent social and economic problems of the region; (2) "Conflicting Religio-political Agendas," in which the churches open themselves to political manipulation by either neoliberal politicians or leftist political movements, which would be destabilizing for Latin America; or (3) "Prophetic Social Catalysts," an optimistic option in which Pentecostals and more progressive Catholics come closer together "in support of styles of citizenship and public policy that favor economic development, social equity, and constitutionalism," (p. 18).

Smith's examination of these scenarios using existing research is the book's most valuable contribution, based as it is on a thorough bibliography. Using this literature, Smith rejects the argument that either Catholics or Pentecostals as a group will retreat from social and political issues into a preoccupation with the afterlife. Given some premature pronouncements that have appeared regarding the death of liberation theology in Latin America, it is indeed refreshing to read about committed, social activist Catholics battling the effects of neoliberal policies. If one were to survey leaders of the Worker's Party in Brazil, for instance, one would likely find that they are adherents of liberation theology and are as involved as ever in taking political action on behalf of the poor. Similarly, Smith dispels the stereotype that Pentecostals are apolitical or uniformly conservative, noting that they are the poor and are showing signs of organizing against social injustice. Smith also dispenses with the notion of a dangerous polarization: "When all the evidence is weighed together, however, it seems very unlikely that either Catholicism or Pentecostalism will legitimize extremist economic or political movements in the foreseeable future" (p. 88).

Smith accepts the third option as the most likely scenario for the coexistence of Catholics and Pentecostals, that is, a collaboration on shared social and religious concerns in a way that strengthens democracy. It is clear from his closing argument, however, that it is far easier to say what the current religious environment in Latin America is not than to predict what it will be. Smith tries to be optimistic, but he also recounts numerous instances of confrontations and angry rivalries between the two groups, and he must conclude that a Pentecostal/Catholic alliance will not appear soon. With this book, Latin American scholars have a concise summary of a respectable body of research about the new religious pluralism, as we await further developments.

Stealing the State: Control and Collapse in Soviet Institutions. By Steven L. Solnick. Cambridge, MA: Harvard University Press, 1999. 337p. \$18.95 paper.

Philip G. Roeder, University of California, San Diego

Steven Solnick provides a rich, neoinstitutionalist analysis of the disintegration of bureaucracies in the last years of the Soviet Union. He adds an important element to our understanding of the complex process of the disintegration of the Soviet Union itself by explaining why bureaucrats in many hierarchies seemed all at once to resist the efforts of the central Soviet state to guide their actions. Using concepts drawn from neoinstitutional political economy, Solnick analyzes the behavior of multiple agents when their common principal can no longer monitor their behavior or sanction

their opportunism. The empirical richness of this book comes from three case studies of bureaucracies designed to mobilize youths in the Soviet Union—political mobilization by local Komsomol organizations, economic mobilization by committees that assigned graduates of higher education institutions to their first job, and military mobilization through local draft boards. Solnick compares each bureaucracy's relative success in fulfilling its chief success indicator (or quota) before the Gorbachev reforms with its performance once the reforms were in place.

A key thesis is that "the Soviet system did not fall victim to stalemate at the top or to a revolution from below... but rather to opportunism from within" (p. 3). The decisive element in the collapse of the Soviet system was the refusal of bureaucrats to obey orders from above. Ideology, elite politics, and societal demands—the three alternatives Solnick considers—cannot account for the pattern of bureaucratic behavior during the reforms. This can only be explained by the opportunism of bureaucrats and the manner in which the reforms led to escalation in opportunism.

Solnick builds on a careful analysis of the behavior of bureaucrats in the Soviet Union before the Gorbachev reforms. Consistent with analyses of other Soviet bureaucracies, he finds that "street-level" bureaucrats in the Komsomol, job-assignment committees, and draft boards focused on the primary indicators used by superiors to evaluate their success—gross output of new members, job assignments, and conscripts. Alternatively, they shirked on secondary indicators, which were less likely to bring either rewards or punishments from principals. Many of these secondary objectives were compromised in the rush to "simulate success" with regard to the primary indicators; local Komsomol organizations continued to add new members without concern for their ideological preparation, and draft boards inducted young men without concern for their health. Solnick argues that the ability of a principal to ensure that agents continue to exercise the principal's "property rights" over the organizational resources in the principal's interests (and not expand their opportunistic behavior so that it compromises fulfillment of the primary success indicator) depends upon the principal's continuing ability to monitor and sanction behavior with regard to the primary objectives.

This leads Solnick to an interesting perspective on how the reforms contributed to organizational collapse. Under Gorbachev's reforms many principals were unable to prevent or punish opportunism, which resulted in a "cascading breakdown of authority." Solnick's graphic metaphor is a run on a bank, but with an important twist: Once it became known that a principal could not sanction a lower-level bureaucrat for violating the "contract" between principal and agent, the latter was more likely to defect—to exercise the property rights in the agent's rather than the principal's interest, as though the organization's resources were the agent's property. More important, all other agents of that same principal then faced a stark choice. If an agent did not defect but others did, the principal could "go bankrupt," and others might seize the assets from the agent's control. An agent who defected risked sanctions but might gain control of a portion of the principal's assets. Agents in different bureaucracies might still differ in their responses to this same cue because the resources they controlled might not be easily reassigned to other purposes (asset specificity). Yet, in the face of information that the principal had not imposed sanctions on the first agents, many defections were likely to follow.

For example, once the Komsomol abandoned binding enrollment targets, street-level agents began to shirk recruitment tasks. Komsomol membership dropped precipitously. The resulting fall in membership dues and cuts in subsidies from the center led local leaders to transform many Komsomol operations into money-making subsidiaries, such as travel bureaus and youth hostels. With their own locally generated resources and little fear of sanctions from the center, these agents were able to assert their independence from the Komsomol organization. At both the center and in the local organizations, officials began to transfer these assets into private commercial investments entirely outside the control of the Komsomol organization. They stole the state.

Solnick provides a compelling picture of the mechanisms of bureaucratic collapse. In the conclusion he explains how this might help us understand the different outcomes of reform in the Soviet Union and China. A sure tribute to the importance of this book in the study of the transition from communism is the debate it should generate among specialists. Two closely related issues may be central to this debate. First, the explanation for the collapse of individual bureaucracies including how opportunism to fulfill organizational objectives, such as meeting a quota, became opportunism that dismantled these very same organizations—may lie outside those bureaucracies. Through much of the story about changes in the youth bureaucracies, the driving force is a series of exogenous shocks (particularly, decisions by the General Secretary) that are, of course, not investigated. These decisions also placed limits on what central bureaucrats could do in sanctioning subordinates. Constraints originating outside the youth bureaucracies may be the essential reason some bureaucracies collapsed and others transformed.

Second, the exogenous factors in the story about youth organizations may contain the essential causes of the collapse of the Soviet Union itself. Indeed, in a very imaginative counterfactual, if Gorbachev's reforms had succeeded and the Soviet Union survived, one still would have expected many of the outcomes that Solnick describes so well—no Komsomol, greater university autonomy and expanded direct contracting for first jobs, and draft boards that continued to deliver youths to the front lines. This may lead some to suspect that the changes in street-level agents were epiphenomenal—at most symptoms of, but not the core reasons for, the collapse of the Soviet Union. Solnick has staked out an important position in what should be a lively and fruitful debate.

From East Germans to Germans?: The New Postcommunist Elites. By Jennifer A. Yoder. Durham, NC, and London: Duke University Press, 1999. 287p. \$54.95 cloth, \$18.95 paper.

Helga A. Welsh, Wake Forest University

The unification of the two Germanys has led to a surge of scholarly literature. Between 1990 and 1995 alone, approximately 3,000 German-language studies analyzed the political, social, and economic transformation processes in the former East Germany. Clearly, in the English-speaking world, the interest in and analysis of German unification have been more muted. Indeed, due to the singularity of unification and the dominant role of the former West Germany in shaping it, the East German case has been neglected in the vast body of literature that focuses on the transition from communism to democracy. This is especially true for the analysis of political elites. The results seem obvious: At the level of national elites, West German politicians govern, and, in general, the East German elite was almost completely replaced. In contrast, in the rest of the former communist world the combi-

nation of elite circulation with elite reproduction has received extensive attention.

Jennifer A. Yoder links elements of elite building in the former East Germany to democratization. She suggests that the implantation of the West German system in the east has led to alienation from, and disappointment with, the current political system that can be lessened by fostering a new indigenous elite. She focuses on one subset of political elites: members of parliament in the five states of former East Germany. These state parliaments are new; the previous state structures were abolished by the communist regime in 1952; and, in contrast to other institutions of governance, elite transfer from the west is negligible. With very few exceptions, East Germans are elected to the parliaments, and the author examines their background, changing expectations, values, and orientations. They are challenged to conform to West German standards, adjust to rapidly changing conditions, and try to create links to the electorate that foster democracy. Thus, Yoder's study of elite building is embedded in a broader analysis of German unification and democratization.

The book is based on a thorough analysis of the German and English literature and is enriched by in-depth interviews with more than eighty parliamentarians, selected from three of the five state legislatures. To set the stage, the author makes a strong, although not original, case to explain why the communist regime was particularly inimical to the development of a counterelite in the German Democratic Republic (GDR). She points out the value and behavioral implications that communist principles of socialization and recruitment have for the first generation of postcommunist elites. She then analyzes the extraordinary elite changes in the equally extraordinary months of 1989-90 that led to the exclusion of former communist officeholders. Once unification and elections to the state parliaments had taken place in October 1990, testing in the "real laboratory for the merger of eastern culture and western institutions" (p. 112) could begin.

At the core of the study is the question: "Will German unification result in elite uniformity, or will the merger of two societies under one political institutional framework allow for unique patterns of political orientations and behavior at the elite level" (p. 113)? Yoder skillfully circumvents the pitfalls of simple answers and highlights the "dissonance between the formal requirements of the new political system and the old patterns of political thinking and behavior" (p. 152). Her work is most interesting and novel in the area of horizontal

elite integration. In particular, the interviews with state legislators shed light on their motivations to become and stay politically active, their initial struggles, and their learning processes. The role model and expertise provided by the west accelerated and facilitated the process, on the one hand, but also led to disappointment and resentment, on the other hand. Distinct differences between eastern and western politicians persist; many politicians in the former GDR struggle to find a synthesis between assimilation to western cultural norms and preservation of those that are specific to their constituencies. In the author's view, finding this role is essential to overcoming existing weak elite-mass linkages. For Yoder, the new parliamentary elites must "link the public to the political system and bridge the political gap between the east and the west" (p. 158).

Although the assessment of existing elite-mass linkages is negative, Yoder is optimistic. East German elites have successfully mastered the immediate tasks of professionalization and normalization; more and more politicians are trying to act as a bridge between exogenous and indigenous policy styles, behaviors, and norms. The analysis of legitimacy deficits among the East German electorate puts the author in familiar and well-traveled territory. Her portrayal is balanced and thoughtful, using indicators such as voter turnout, party membership, and trust in institutions. The question lingers to what extent doubts about the legitimacy of the new system can be attributed to the specific conditions of German unification or to the uncertainties and vagaries of any transition. After all, similar developments can be found in other postcommunist settings, a fact to which she alludes too briefly.

Yoder fills a void in the literature by demonstrating how, in the years immediately following the collapse of communism in East Germany, elite composition and elite culture were recast. She makes a strong case for the influence of regional elites in providing regime legitimacy in Germany and elsewhere. Her synthesis of past developments also raises stimulating questions about the future: Will former communist settings generate new patterns of elite structure and culture that are substantially different from western models? Will eastern German politicians emulate western patterns or develop their own? Although it is too early to settle on answers, Yoder's study will inform those who want to pursue them—in eastern Germany and elsewhere in the former communist countries of Central and Eastern Europe.

International Relations

Cultures of Antimilitarism: National Security in Germany and Japan. By Thomas U. Berger. Baltimore, MD: Johns Hopkins University Press, 1998. 256p. \$38.00.

Richard Leitch, Gustavus Adolphus College

Thomas Berger joins an expanding cadre of international relations and comparative politics scholars who have focused on the cultural differences between nation-states to explain foreign (and more specifically, military) policy decision making. Nations will act and react to changes in the international system differently and distinctively, Berger argues, depending on their "domestic political forces and institutions" and their political actors' "socially negotiated understandings of past historical events" (p. xl). These conclusions should not surprise many readers, nor should Berger's prepared defense

against an anticipated attack by those he expects will criticize the tautological risks inherent in cultural approaches (read: system determinists and material rationalists).

As an economically ascendant Japan and Germany assumed a more visible international role in the mid- to late 1980s, international relations scholars and analysts revisited and reissued hegemonic stability theories and theories to explain and predict the rise and fall of "great powers." Laden with these presuppositions, Berger planned to watch the militarist rise of Japan and Germany and, presumably, craft his doctoral dissertation from all that transpired. Contrary to what Berger and some others expected, however, and challenging his reading of Hans Morgenthau, neither Japan nor Germany had any intention of assuming the military side of great power status. Instead of explaining what happened, Berger was forced to understand why it did not. His conclusion is fairly obvious: Japanese and German military and

foreign policies were constrained by domestic memories of decisive military defeats, which created in both an enduring antimilitarist sentiment.

Berger contends his study bridges the realms of the institutionalist/elite level political culture perspective, on the one hand (as advanced by John Odell, U.S. International Monetary Policy: Markets, Power and Ideas as Sources of Change, 1982, and especially Peter Hall, Governing the Economy, 1986), and, on the other hand, that of scholars who approach political culture "as it is rooted in the microlevel institutions of society—the family, the church, and so forth" (Ronald Inglehart, Culture Shift in Advanced Industrial Societtes, 1990; Robert Putnam, Making Democracy Work: Civic Traditions in Modern Italy, 1993) (pp. 204-5). In applying this two-pronged method to a fifty-year period of the evolution, development, and entrenchment of antimilitarist sentiment in two nations, Berger inevitably must sacrifice something in a book of this length. His indebtedness to the institutionalist/ elite perspective is apparent, as he does not sufficiently delve into the "microlevel" side, let alone parse its distinct elements. The result is an aggregated "society" as expressed primarily through public opinion data. Behind these numbers are there not generational differences that must be considered, especially in a work that claims to understand why antimilitarist sentiment remains so deep in both countries, despite citizens who have lived fifty years without memories of the war?

Berger draws from a wealth of original German and Japanese language sources and provides supportive interviews with foreign policy decision makers, academics, and other experts in both countries. Yet, the analysis is deficient in fully explaining the way(s) in which antimilitarist messages are perpetuated in either Japan or Germany. Challenges to this antimilitarist sentiment are presented in the form of (among others) official visits by leaders to memorials that honor soldiers killed in the war and, paradoxically, the consistent support for these leaders (Nakasone and Kohl) following an initial public uproar.

But is that the only way, or even the primary way, in which antimilitarist thought and policies are reinforced in the collective psyche of a nation—through a perceived attack on the antimilitarist status quo, with reaction to that attack providing the principal opportunity to defend and simultaneously advance that sentiment? Or are there other, more consistent ways in which antimilitarism is underlied as the "socially negotiated understanding," ways that Berger largely fails to address (Putnam 1993)? Why does an antimilitarist sentiment persist among generations that have not experienced war, especially since, as Berger admits, Japan suffers from collective "historical amnesia," and the issue of Japan's role in World War II is virtually glossed over by Japanese textbooks? Are those Germans and Japanese born after the war, particularly after what is for Berger the defining period of the 1950s and 1960s, antimilitarist because military/security issues are of no apparent interest to them, or are they antimilitarists by conviction? Berger does discuss the rise of the Greens in Germany and the Komeito in Japan (the former more explicitly linked to a challenge to antimilitarism than the latter), but his examination of the nonelite view of political culture remains largely at the level of political parties.

As a comparative study of postwar domestic factors (and to a lesser extent international factors) that contribute to military policymaking, this is a well-researched and generally well-presented piece of scholarship. For scholars of Japanese and German military politics, the analytical perspective and considerations will be familiar (military-related interpreta-

tions of the German Basic Law and Japan's postwar constitution; neighboring states' concerns of a military revival; alliance politics; civilian control of the military). The actors (Adenauer and Yoshida, Kohl and Nakasone, among them), their assumed perceptions, and their actions are also familiar. Again, one can cover only so much ground and cover it thoroughly in a book of this length. Yet, I believe a significant amount of familiar territory could have been shelved in favor of an investigation of more analytically compelling issues germane to the book's thesis. One also should not dismiss the influence of a range of issues created by Japan's protracted recession or German reunification in stifling any plans of either nation to assume or pursue a more militarily visible and active role. These circumstances confronted the respective governments during the time Berger had expected them to be more militarily committed and engaged. Berger does not consider either of these explanations. That assumes, of course, that significant groups of domestic decision makers in Japan and/or Germany, or a significant percentage of the electorate in either of these two democracies, harbored goals of great power status in the first place.

Statecraft and Security: The Cold War and Beyond. Edited by Ken Booth. Cambridge: Cambridge University Press, 1998. 358p. \$59.95 cloth, \$19.95 paper.

Mark Neufeld, Trent University

With the collapse of the Soviet Union and the end of the Cold War, an obvious question presents itself: What next? One can discern at least two distinct categories of response from students of world politics. Some scholars view the history of the Cold War, from start to finish, as being consistent with—indeed, a clear confirmation of—established theories of world politics. For them, what is required is simply new analysis of the changes wrought by the passing of the East-West conflict. Other scholars view the history of the Cold War less as an occasion to reaffirm the value of conventional wisdom than as an opportunity to reflect on the (in)adequacy of our theoretical frameworks. Not just new analysis is needed, they argue, but new ways of analyzing.

This distinction provides a means of assessing the individual contributions to the volume under review. The book is divided into three parts, each reflecting a different point of entry for considering the Cold War. In Part 1, the lessons and legacies of the Cold War are taken up, including debates surrounding its origins and ending as well as the place of nuclear weapons. In Part 2, the focus shifts to an exploration of the actors and expected behaviors in the post–Cold War world. Questions addressed range from the leadership potential of the United States, the prospects for postcommunist Russia and post–Cold War Europe, the role for middle powers and for Japan and China, and the difficulties facing the societies of the African continent. Part 3 casts an eye to long-range trends and possibilities, including the reform of international institutions, questions of human identity, and life politics under conditions of globalization.

It is noteworthy that this book shows considerable openness to the idea that new ways of thinking (not just new analysis using conventional frameworks) are required to meet current challenges. This should not come as a surprise, since Ken Booth is a long-time critic of established orthodoxies and an advocate of "new thinking" in the study of world politics. A good example of both is the opening chapter, in which Booth explores the ways the Cold War both structured and was perpetuated by the divisions it created in human minds. Other noteworthy contributions come from Raymond Garthoff (who addresses the question of "blame" for the Cold War), Denis Stairs (who reflects on the category of "medium powers" and their potential roles), and Anthony

Giddens (who explores the significance of the transition from "emancipatory politics" to "life politics").

Perhaps one of the more useful contributions of this volume is the call, in a number of separate contributions, to widen the definition of security beyond that of traditional state-centric notions. John Steinbruner, for example, argues that, given the need for stable employment as a means of assuring civil order, a state's employment strategy is increasingly an international security issue. It is no great leap from this position, moreover, to that promoted in Booth's concluding chapter. Questions of security and statecraft in a post—Cold War world must be framed in terms of the larger question of global transformation, including globalization (the effects of an increasingly wired global capitalist economy), global governance (the organization of world politics), and global moral science (the relevance of dominant political and ethical ideas).

Not all contributors show the same openness to rethinking radically basic assumptions about world politics. At best this lack of openness leads to an excessively tentative restatement of some of the more obvious points long made by less "responsible" scholars (e.g., the chapter by Richard Ned Lebow and Janice Gross Stein cautiously allows that the nuclear war-fighting strategies adopted by the two superpowers may have contributed to political instability). At worst it leads to an unreflective promotion of the worst kind of neoliberal "end-of-history" thesis; as suggested by Barry Blechman's contribution, the values of democracy, peace, and respect for the rule of law-as exemplified in U.S. foreign policy—need only time and commitment to become fully formative of the politics of the global polity more generally. Truly, "more of the same" seems in no danger of losing its secure place within the offerings of the academic community for the foreseeable future.

At the risk of seeming unappreciative of the ideas of those who have tried to break free of established conventions of thought, it is worth noting the self-imposed limits within which even the more iconoclastic chapters are written. It is surely not insignificant that those who break with mainstream thinking draw almost exclusively on neoidealist currents for inspiration. What is not engaged in any sustained way are the arguments of more radical theorists regarding the Cold War: neither historical materialists, such as E. P. Thompson, Noam Chomsky, Immanuel Wallerstein, and Robert Cox, nor feminist scholars, such as Cynthia Enloe and Jean Elshtain. Perhaps for this reason the laudable critique of limited thinking is not linked up in any systematic way with an analysis of material interests or gender, an analysis that might clarify how certain kinds of deformed thinking, while running counter to the general interest, can nonetheless be extremely beneficial to certain social groupings.

All of which is rather disappointing. For those who share a normative commitment to a more just, more humane post—Cold War world, engaging the full range of understandings of where we came from would seem vital to help us get to where we want to go. Still, although this volume may not go as far as some would like, taken as whole it does start us down a very important path. For that reason alone it merits consideration.

The Past and Future of Nuclear Deterrence. By Stephen J. Cimbala. Westport, CT, and London: Praeger, 1998. 235p. \$55.00.

Gregory Paul Domin, Mercer University

Stephen J. Cimbala provides a welcome addition to the ongoing debate over the utility or danger of the spread of nuclear weapons, "now that they have been freed of their

Cold War dependency and nuclear diplomacy [is freed] from its rigid connection to the US-Soviet power struggle" (p. 2). Academics as well as policymakers have fervently debated the possible consequences of the spread of nuclear weapons. Most analysts argue that the spread will ultimately destabilize the international system and lead to nuclear war. Others counter, however, that the prospects of nuclear war are reason enough for states to adopt sagacious security policies. Cimbala's book is a wonderful synthesis of Cold War history/examples and post—Cold War policy that is full of lessons for students interested in the subject.

Cimbala offers a well-written and well-conceived volume. Over the course of seven chapters, he examines "the nuclear past in order to foretell at least in some part of the nuclear future" (p. 1). He assesses how nuclear weapons and nuclear deterrence vis-à-vis the United States and the Soviet Union functioned during the Cold War and how such weapons may be leashed in the post-Cold War era. Cimbala examines several case studies, from the Cuban Missile Crisis, to START II, to limited nuclear war in the old and new world orders. He looks closely at these cases through the analytic lens of deterrence and concludes that "what we learned about nuclear weapons and nuclear deterrence from the Cold War should not be forgotten, lest we repent" (p. 7). One can make the argument that the logic, or illogic, of nuclear proliferation in the current era does not necessarily destabilize international relations and may even reduce the risk of war (which neorealist Kenneth Waltz has been arguing for years).

Although clearly aware that his conclusions may extend well beyond the case studies, Cimbala does not attempt to draw unnecessarily sweeping generalizations about the future of nuclear deterrence. Instead, he allows his conclusions to emerge from the case studies. He suggests, for example, there is little evidence that during the Cold War either the United States or the Soviet Union was preparing for a possible preemptive nuclear strike, as the post-Cold War literature has suggested for the past ten years. Rather, both sides had accepted the logic of deterrence. This makes Cimbala somewhat optimistic about the future, because the two superpowers demonstrate that deterrence works. Nuclear "weapons can be used in two ways: by threatening to physically deny the opponent his objectives in battle or by threatening to destroy enough of the opponent's social values in retaliation so that any attack does not pay. Nuclear weapons, then and now, deter threat or retaliation posing unacceptable damage" (p. 213). Cimbala provides important arguments in favor of the logic of deterrence versus the logic of nonproliferation in a very straightforward manner.

This volume needs to be read by academics and policymakers alike. Its clear and relatively idiom-free prose makes it accessible to students interested in regionalized conflict. It should be required reading for anyone with an interest in this most important issue.

The Sanctions Paradox: Economic Statecraft and International Relations. By Daniel W. Drezner. Cambridge: Cambridge University Press, 1999. 342p. \$64.95 cloth, \$24.95 paper.

T. Clifton Morgan, Rice University

The last quarter of the twentieth century was characterized by a substantial increase in the use of economic sanctions as an instrument of foreign policy. They became the weapon of choice for many, particularly in the United States, because they are perceived to be a less costly and more moral alternative to the use of military force. Curiously, however, this occurred in the face of a strong consensus among scholars and pundits that economic sanctions are ineffective at bringing about change in the target states' policies. One must wonder whether policymakers know something that analysts do not or are so callous as to enact policies known to be ineffective even though there will be costs imposed on their own citizens. Drezner reports on part of a growing body of research that addresses the puzzle of economic sanctions. He develops a theoretical argument capable of explaining when sanctions will be imposed (even when failure is expected) and when they will induce the target state to alter its policies. He subjects this theoretical argument to a wide variety of empirical tests.

A common argument suggests that sanctions continue to be employed in spite of their apparent ineffectiveness because they serve domestic political or symbolic purposes. That is, decision makers impose economic sanctions that they know will not affect the target state's behavior in order to satisfy domestic constituents and/or convey a principled stance. One of the most significant contributions of Drezner's book rests in its attack on this argument. Through a review of empirical studies regarding initiation of sanctions as well as through his own statistical tests, Drezner argues convincingly that sanctions are generally imposed to achieve policy goals, not to pursue domestic or symbolic ends. Drezner builds a particularly nice case on this point. Instead of viewing each side of the debate (symbolic/domestic versus policy) as an hypothesis, he treats each as a theoretical argument. Thus, rather than try to test each directly, he derives implications from each and identifies instances in which contradictory expectations regarding specific relationships occur. For example, he suggests that if the domestic politics argument is correct, then we should expect democracies to achieve their policy goals through sanctions less often than do other states. If sanctions are intended to serve policy goals, then there should be no difference in success rates between democracies and other types of states. Drezner makes his point empirically through a series of critical experiments on such contradictory expectations. The results consistently support the notion that sanctions are generally imposed to serve policy goals.

The major focus of the book is the theory Drezner develops to explain when sanctions will be imposed and with what effect. This theory is based on a relatively simple game-theoretic model. Drezner develops a basic, complete information model in which the actors' utilities are a function of only the costs associated with sanctions and the benefits associated with various policy outcomes. The fascinating aspect of this model is that the primary conclusion to which it leads is that sanctions should never be observed. If the costs of sanctions will be sufficient to induce a change in behavior on the part of the target, then the target can anticipate this and acquiesce before those costs are paid; if the costs are not sufficient to induce a change in the target's behavior, then the sanctioner, who can also anticipate the outcome, will not impose sanctions.

Drezner draws the appropriate conclusion from this result: Something else must be added to the model. Game theorists will probably anticipate that the next step is to incorporate incomplete information, but Drezner follows a different path. He develops the model in a manner suggesting that states' expectations regarding the future of their relationship strongly affect their behavior in sanctions situations. In particular, states' conflict expectations (the probability of becoming involved in additional conflicts with one another) determine whether they are more concerned with absolute or relative gains. If they anticipate that any advantage gained by the opponent in the current conflict can be used to gain

additional advantages in future conflicts, then they will be far more willing to suffer costs that might otherwise appear irrational. Thus, states will be more concerned with relative gains when dealing with an enemy and with absolute gains when dealing with an ally. Incorporating this insight into the model leads to a number of interesting, and testable, propositions. In brief, the model leads us to expect that sanctions will rarely be imposed on allies, but when they are, they are likely to be successful. States will be willing to impose, and maintain, sanctions on enemies even when there is little chance of success, and in these cases the target is likely to hold out even under extreme costs.

Much of the book is devoted to testing these hypotheses in a number of contexts. Statistical tests are based on large samples of sanctions episodes. In particularly detailed and interesting accounts, Drezner uses case studies of economic coercion by Russia on other states from the former Soviet empire. The case studies are well done and are carefully, and creatively, designed to provide tests of expectations derived from the theory, rather than just used to provide real-world support for ad hoc assertions. Each study follows a set pattern, which suggests they were done systematically, and this makes it easy for the reader to gauge the support for the conclusions. Not surprisingly, the empirical results provide strong support for the conflict expectations model.

This book makes a very real contribution to the literature on economic sanctions and should be taken seriously by all who work in this area. The major criticism is that the model is not taken very far, and not much indication is provided regarding what can be done in the future. That conflict expectations matter in some simple and predictable ways is useful, but the model is not used to explain more than a few aspects of the sanctions phenomenon. This criticism can be addressed through future work, but if the model cannot lead to more hypotheses than are presented in this book, it is destined to be superceded by a more encompassing approach. The ideas and evidence are sufficiently intriguing, however, to suggest that Drezner, and others, should push the model farther.

Inventing International Society: A History of the English School. By Tim Dunne. London: Macmillan in association with St. Antony's College, Oxford, 1998; New York: St. Martin's, 1998. 207p. \$65.00.

Robert Jackson, University of British Columbia

The classical international society approach to the study of international relations, that is, the "English School," owes its origins to the financial generosity of the Rockefeller Foundation. In 1954 Dean Rusk and Kenneth W. Thompson organized a group of American journalists, academics, and Department of State officials to investigate theoretical aspects of international relations. In 1958, at the suggestion of Thompson, a similar committee of British scholars and commentators on world affairs was funded and organized. Unlike its U.S. predecessor, it successfully launched a tradition of inquiry that attracted younger scholars not only from Britam but also from Australia, Europe, South Africa, Canada, and Japan, among other places. That traditional interdisciplinary approach inquires into the principles of foreign policy, the practices of statecraft and diplomacy, the ethics of war, the place of human rights in a world of sovereign states, and so on. It calls upon the knowledge of political and moral philosophy, international law, and diplomatic and military history.

Although the American committee also took something of

a traditional approach, it published an edited volume and disbanded (W. T. R. Fox, ed., *Theoretical Aspects of International Relations*, 1959). Its legacy was soon swept away by the rising tide of social science positivism that drew its inspiration from sociology, psychology, economics, and the philosophy of science and that went on to dominate the study of international relations in the United States over the next four decades.

Tim Dunne has written a highly readable history about development of the English School and the work of some of its leading representatives. In an opening chapter he outlines the approach they take, stressing, quite rightly, their emphasis on a "tradition of inquiry," their "interpretive approach," and the importance they assign to normative theory. He devotes two chapters to the Rockefeller-funded British Committee, which left a deposit of significant writings, the most important being a volume edited by Herbert Butterfield and Martin Wight, (Diplomatic Investigations, 1968), which contains seminal contributions not only by the editors but also by Hedley Bull, Michael Howard, and several other scholars. There are separate and insightful chapters on Wight, Butterfield, Bull, and John Vincent. All of that, and more, will enlighten and inform anyone who may be interested in learning about the classical approach that survived and even flourished on the other side of the Atlantic during the same period that the social sciences colonized the study of international relations in North America.

Unfortunately, Dunne was not content merely to present and assess the academic contribution of the English School. He tried to incorporate into it something alien, namely, the work of E. H. Carr and of critical IR theorists (and constructivists) more generally. Carr was never a member of the British Committee. He did not write in the same vein as Butterfield, Wight, Bull, or Vincent. His work does not strive to enter into the political uncertainties and moral dilemmas of statesmen, which the English scholars felt obliged to do in order to understand the profoundly human character of diplomacy, foreign policy, war, and international relations more generally. Carr had very different scholarly inclinations. He downplayed the situational ethics of statecraft and understood power in an altogether more sociological and materialist way. Power was a determining force in world affairs, not merely an agency or apparatus that statesmen could employ for good or ill. He was, as Dunne rightly notes, a prototypical critical theorist. "Power for Carr, unlike Bull or Vincent, goes all the way down" (p. 36). That is far removed from the classical humanism of Wight, Butterfield, or Bull.

Presumably Dunne assigned Carr to the English School to buttress his claim that a new version of international society theory has been perfected that escapes the state-centric predilections and politically agnostic detachment of Butterfield, Wight, Bull, and Vincent. These progressive international society theorists, led by Ken Booth and Andrew Linklater, are ambitiously seeking to provide intellectual direction that will enable humanity to realize its destiny of freedom and justice by breaking the chains of political nationality and state citizenship. But that purported fraternity between the classical international society theorists and the critical theorists, which Dunne captures using the elastic expression "critical international society theory," is two different schools of scholarship, not one. The classical theorists and the critical theorists approach the study of international society in ways that are as unlike as, shall we say, Grotius and Burke, on the one hand, and Marx and Engels, on the other. That is the only major flaw of this otherwise informative and useful study.

Poststructuralism and International Relations: Bringing the Political Back In. By Jenny Edkins. Boulder, CO: Lynne Rienner, 1999. 163p. \$49.95.

Navigating Modernity: Postcolonialism, Identity, and International Relations. By Albert J. Paolini. Boulder, CO: Lynne Rienner, 1999. 227p. \$52.00.

Jutta Weldes, University of Bristol

In an age of rampant liberal triumphalism, Jenny Edkins and Albert Paolini seek to reclaim the political for an IR discipline that is increasingly apolitical or even antipolitical. Edkins demonstrates that poststructuralism broadly defined offers a "route to repoliticization" (p. 16) for IR by drawing our attention back to the artificial and contingent character of the taken-for-granted of the social order. Paolini examines "the political implications of the perspectives of postcolonialism in order to make sense of what postcolonialism offers in its account of the place of the marginalized and the dispossessed in the contemporary world" (p. 49). Read together, these two volumes generate a fruitful debate: Edkins straightforwardly lays out some of the major poststructural arguments about subjectivity, while Paolini challenges them to be thought about more reflexively and subtly under conditions of postcoloniality.

In a slim but by no means slight volume, Edkins challenges IR to take more seriously the notions of subjectivity and ideology, which can reinvest the discipline with a more overtly political sensibility. She offers a convincing refutation of the standard charge that poststructural arguments disable political engagement; in fact, as she shows, poststructuralism allows us to bring the political back into the study of politics. She offers a remarkably lucid treatment of a series of complex theoretical issues, which renders them accessible to a wide audience. In successive chapters she defines politics, depoliticization, and subjectivity and then examines the decentering of the Enlightenment subject. This is followed by four admirably clear chapters that elucidate the arguments of Michel Foucault on discourse, disciplinary practices, and power/knowledge; Jacques Derrida on logocentrism, the supplement, and deconstruction; Jacques Lacan on the mirror stage and ideology; and Slavoj Zizek on subjectivity and ideology. Through this exegesis, Edkins attempts to shift our thinking from a depoliticized notion of politics as "rational calculability and planning" (p. 9) to a notion of "the political," by focusing our attention on truly political moments. Such moments are obscured or concealed by the notion of politics dominant in IR, which is in important ways "depoliticized" or "technologized" (pp. 9-14). Politics in this narrower sense is equated with "that sphere of social life commonly called politics: elections, political parties, the doings of parliaments and governments, the state apparatus, and in the case of international politics, treaties, international agreements, diplomacy, wars, institutions of which states are members (such as the United Nations), and the actions of statesmen and women" (p. 2).

The truly political moments that Edkins labels "the political," in contrast, are about "the establishment of that very social order which sets out a particular, historically specific account of what counts as politics and defines other areas of social life as not politics" (p. 2, emphasis in original). There are two aspects to this political. The first is "the founding moment of a social totality in revolution" (p. 136) when a new social order is created, such as "the move to totalitarianism in the USSR" (p. 3) or the "events of 1989 in Europe" (pp. 125-6).). As feminists remind us, however, "the political is not limited to grand moments of openness or undecidability"; rather, it compasses "every moment of decision" (p. 5). The

second aspect of the political is thus "the more prosaic moment of the endless process of decisioning" (p. 136). Edkins quite convincingly argues that the poststructural concepts of subjectivity and ideology can contribute to the investigation of such political moments.

Paolini's volume, which is less sharp and so a more difficult read, also tackles questions of politics, subjectivity, and agency, specifically with respect to postcoloniality and the possibility of resistance to domination. As does Edkins, Paolini offers a widely ranging criticism of IR, especially its statism and the fact that it is "excessively Western in sensibility and orientation" (p. 30). But Paolini is more skeptical than Edkins about the usefulness of a postmodern reading of the Third World and of postcoloniality. He recognizes that such an approach is in many ways "apt and useful" (p. 98), but he also notes that it needs ridding of 'the Western baggage that accompanies [it] into the postcolonial" (p. 98); including problems with its notion of identity. He argues that a postmodern reading imports Western disillusionment inappropriately to the Third World, where there might instead be attractions to modernity (pp. 98-9); that it homogenizes and flattens the Third World and its heterogeneity (pp. 100-1); and that its notions of subjectivity, agency, and resistance actually undermine prospects for agency and thus for resistance (pp. 101-2). The poststructural dichotomy of essentialism versus death of the subject, he argues, in fact disempowers people who are just finally finding a voice. As Paolini points out, "the balancing between a postmodern reading and the need to carve out a space for enabling action on the part of postcolonial subjects is an inherently awkward one" (p. 58). His analysis thus questions Edkins's claim that poststructuralism easily offers a political strategy, and Paolini provides a more nuanced and critical analysis of the relationship of postmodernism to agency.

Despite their merits, these volumes have limitations. Both, for example, reproduce the contemporary imbalance between theory and analysis in IR. I repeatedly found myself asking: Where is the stuff of world politics? With the exception of a few examples much too few and much too sketchy—there is no empirical material in Poststructuralism in International Relations (in fairness to Edkins, she has carried out such research elsewhere). Although the book is undoubtedly useful to IR scholars and students, it is not actually about world politics at all and could more appropriately have been called "Poststructuralism and the Political." Navigating Modernity suffers from a similar weakness. Paolini repeatedly promises us that the abstract investigation of postcolonialism and identity will be applied to Africa, but the empirical analysis recedes like a mirage as we advance through the book. It resolves in the end into a tiny oasis, made up of little more than a few anecdotes and vignettes derived from others' writings. In both volumes, the empirical material is too little and comes too late to be convincing. From Edkins I wished for some extended examples to show how these wonderfully elucidated theoretical concepts might help me with concrete problems of world politics. From Paolini I wished for the theory to be pulled together, as promised, in the African case.

Each volume also has at least one major theoretical drawback. Although Edkins recognizes that the political includes both the founding moment of a social totality and the more prosaic moment of decisioning, she neglects the latter in favor of the former. That is, she formally recognizes (e.g., p. 128) but practically ignores the political nature of the constant reproduction of and resistance to elements of the social order. In the end, and I am sure it is not what she intended, her defense of the utility of poststructuralism actually seems to limit what poststructuralism can contribute

to political and international analysis. She wants it to encompass the political defined broadly as all constitutive moments and exercises of power, but she really focuses on and seems to privilege the narrower notion. I would argue that post-structuralism is more widely useful than this book implies.

Similarly, while I sympathize with Paolini's emphasis on subjectivity and identity, I am increasingly uncomfortable with the tendency in some poststructural analysis to substitute these concepts for material structures of oppression associated with race, class, and gender. Although Paolini mentions materialist critiques of postcolonialism's culturalism, he effectively dismisses these interventions as subject to the danger of "excessive structuralism" (p. 119). Ironically, this has the effect of displacing the everyday experience of gender oppression, for example, with analysis only of the discursive construction of subjectivity. Something is lost in that translation.

Despite these shortcomings, each volume more than lives up to the promise of the Lynne Rienner series to offer critical perspective on world politics. Both are excellent teaching tools for graduate and perhaps even undergraduate courses. Edkins offers an outstanding introduction to some of the central ideas of poststructuralism; Paolini offers a useful introduction, among other things, to the concept of postcoloniality and the relationship of globalization to the Third World. These volumes, in short, are useful in complementary ways: Edkins provides a crisp exposition of several important theoretical arguments; Paolini's detailed analysis makes possible a sophisticated integration of the Third World into IR, and hence enables an IR worthy of the name.

Elections and War: The Electoral Incentive in the Democratic Politics of War and Peace. By Kurt Taylor Gaubatz. Stanford, CA: Stanford University Press, 1999. 208p. \$45.00.

Zeev Maoz, Tel-Aviv University

Kurt Gaubatz explores the relations among public opinion, electoral politics, and peace and war decisions in democratic states. The study is an outgrowth of the author's doctoral dissertation, but it reads like a coherent and mature book and does not have the standard and technical features often associated with doctoral theses. Gaubatz's starting point is that, despite the large body of literature on the democratic peace phenomenon, there is a "surprising lack of effective work drawing connections between the internal political processes of democratic states and [war and peace] outcomes at the international level" (p. 3). Accordingly, this book explores how democratic politics work to affect national security issues.

The author develops a framework that envisions three major domestic inputs to foreign policy choices: government leaders, opposition elites, and mass publics. The structure and workings of domestic institutions mediate the link between these inputs and foreign policy choices. The focus is on the effects of domestic politics on foreign policy outcomes, but the framework also discusses how foreign governments and the choices of the democratic state interact to produce international outcomes.

The book is organized around this framework, and each chapter focuses on one of its elements. Gaubatz starts by discussing various notions about the relations among public attitudes, elite attitudes, and peace and war decisions. He first dismisses the realist notion that domestic processes have little or no effect on peace and war decisions. At the same time, he discounts naive notions about the "nature" of

democratic publics. His argument, which he labels "protean public," is that democratic publics are neither inherently pacifist nor easily swayed by inflammatory rhetonic. They respond to international events and to their own leaders, and at the same time their attitudes have an effect on leaders' choices.

Leaders interact not only with the mass public in general but also with opposition elites. This interaction sometimes produces outcomes that are opposed to leaders' own preferences with regard to foreign policy. In some cases, leaders who opt for war may refrain from it, even if a small but significant public minority opposes it. Gaubatz's analysis of public opinion and leaders' preferences during the interwar years in Europe, the United States, and Canada provide interesting illustrations of these arguments. The three nineteenth-century cases in which democratic publics displayed prowar attitudes (the Crimean War, the Boer War, and the Spanish-American War) are less convincing. Gaubatz does not succeed in documenting whether leaders entered these wars because of public pressures or because public pressures coincided with leaders' preferences for war.

Gaubatz focuses on elections and electoral politics to analyze the influence of democratic institutions on foreign policy choices. He examines these politics in terms of "election cycles," that is, the potential relationship between the distance from the last election and the proximity to the next election and conflict decisions. Using both the militarized interstate dispute (MID) and interstate war data, he tests for the effect of election cycles in dispute and war behavior. The most significant finding is that "democratic states have entered significantly more wars in the early stages of their electoral cycles and significantly fewer wars in the latter stages" (p. 142).

The general conclusions of the study suggest that democratic politics make a difference in peace and war decisions, but their workings are more complex than presumed by various theoretical approaches. Realist notions of international behavior, other naive notions about pacifist or militant publics, and simple-minded election cycle effects do not seem to account for the nature or the scope of the linkages between democratic politics and war. Gaubatz advocates a contingent approach that takes into account not only the changing moods about wars within democratic publics but also—and this is an important contribution—the ways in which the transparency of democratic politics affects actual and potential opponents. Overall, Gaubatz cautions against sweeping generalizations about democratic politics and war, but he argues that certain limited, although relatively robust, patterns do exist.

The book makes several important contributions to knowledge about democratic politics and war. It offers an interesting framework for studying these relationships. Some may object to certain elements of this framework, but overall it is a good starting point from which one may develop theoretical propositions. It also serves as a primary guide for empirical research. Gaubatz is not wedded to his framework and is willing to reassess some of its elements (e.g., the discussion on the effect of democratic politics on opponents of democracies, pp. 122-4). The book covers a relatively large array of cases, which are generally insightful and well documented. Gaubatz offers a balanced argument about democratic politics and war that rejects naive views of such politics, on the one hand, or a dismissive perspective of democratic effects on foreign policy, on the other. Finally, the book is well written, and the arguments and empirical discussions—especially the historical case studies—flow smoothly and convincingly. This makes the volume potentially appealing to both practitioners and the educated public beyond the specialized scholarly community of political scientists.

The book has some weaknesses. Perhaps the chief among them is methodological. The choice of cases appears fairly arbitrary, although the cases themselves are quite interesting. For example, virtually all involve conflicts between democracies and nondemocratic states (or against rebels in a colonial setting), whereas proponents of the democratic peace proposition often argue that democratic politics matter most (or exclusively) when democracies confront one another. There is no clear structure to the case studies themselves. Each is conducted in relatively free form, although it is set to confirm or disconfirm a theoretical argument. Furthermore, the quantitative analysis is problematic in certain respects. The most important problem concerns the failure to control for other internal or international factors often mentioned in the literature as facilitators or inhibitors of conflict and war behavior. In addition, the failure to consider "opportunities" for conflict makes the interpretation of the findings on election cycles and conflict behavior tenuous due to potential selection bias.

Despite these critical aspects, the balance is quite positive. This is an interesting and insightful start on a very important subject. It will make a very useful addition to the burgeoning literature on the relationship between domestic and international processes.

At Arm's Length: The European Union and Europe's Defence Industry. By Terrence R. Guay. New York: St. Martin's, 1998. 219p. \$59.95.

Anand Menon, University of Oxford

The author sets out to provide a theoretically grounded explanation of the development of European Union (EU) influence over defense industry policy. His core argument is that, despite clear limits, this influence has grown significantly since the end of the Cold War. He employs a "reactive spillover" approach to explain such developments. This displays several obvious similarities with neofunctionalism—a theory of integration that has been around for half a century. First, it "accepts that sub- and supra-state actors are the main agents of integration" (known in neofunctionalist jargon as political and cultivated spillover, respectively). Second, reactive spillover uses the concept of "functional spillover" to explain how integration spreads from one functional sector to another: "Economic integration in other sectors has pulled in (or spilled over into) the defense sector" (p. 179). In addition, however, reactive spillover stresses the role of the international environment—both the changes under way in the international economy and more political factors, such as the end of the Cold War-in determining the pace and scope of spillover in this policy sector.

The book is well researched and provides a host of interesting empirical information concerning the changes that have occurred in European defense industries since the early 1990s. The arguments presented in chapter 2—that shifts in the global economy and the tremendously rapid consolidation of the American defense industry that accompanied it necessitate fundamental changes in the European defense industry—are compelling. More generally, it is refreshing to see the relationship between European integration and defense issues being treated at all in a book-length study, as security issues in general are often ignored by students of European integration.

The book is flawed in several ways. First, it is far from clear that the author marshals sufficient empirical evidence to

justify either his empirical or theoretical claims. Guay did not convince me of his central empirical argument, that is, the EU, and particularly the supranational institutions, exerts significant influence over defense industry policies. Certainly, the EU has started to intrude at the margins, but this is a far cry from the claim that "the ability of the EU institutions to push the integration process . . . is very evident in this area" (p. 176). He cites as evidence the fact that "Commission officials made numerous speeches challenging the existence of Article 223" (the Treaty of Rome article that grants a derogation from the laws governing the common then single market to defense-related products) (p. 176). Yet, Article 223 still exists. This is not "agenda setting" (p. 176) but, rather, an illustration of the continuing ability of the member states, and particularly in this case the larger ones, to block integration when it suits their interests.

The treatment of interest groups also is not convincing. As Guay himself admits (p. 161), it is impossible to generalize from the limited number of interviews carried out with defense industry officials. Moreover, the evidence presented has more to do with the attitudes of these officials toward a putative EU role in defense industry policy than with the influence they have managed to wield over developments in this area. Stating preferences is not the same as ascertaining influence, hence using the claim (possibly empirically unsustainable) that "most defense firms regard a European armaments procurement agency as a desirable objective" (preferences) to illustrate the presence of some degree of political spillover (influence) is simply misleading.

Indeed, so keen is the author to put forward his point of view that one is sometimes drawn to the conclusion that he is pursuing an ideological agenda. The notion that the "economic pressures exerted by a push to form a single European market will eventually engulf the armaments sector" (p. 72) is far from proven. Indeed, one could argue precisely the contrary. The tremendous pressures working in favor of increased consolidation of the European defense industry—American restructuring, increasingly aggressive American competition for export markets, decreasing defense budgets, and more expensive unit costs—have so far led to little integration. What chance is there that this will ever occur?

The book leads one to wonder whether the traditional theories of integration deployed and tested by Guay really serve much purpose in treating the relationship between the EU and this particular policy sector. Numerous detailed case studies have found that elements of both are useful in explaining the development of the EU. Yet, few if any provide theoretically useful indications as to under what conditions this may be the case. Guay's book falls into this precise trap. Reactive spillover seems little more than a statement that international factors matter. How, when, and in what ways are questions that are not systematically addressed. Moreover, traditional theories of integration do not consider in any detail the role of institutions other than the EC/EU in shaping policy outcomes. This may not be of significance in some policy areas, but it certainly is in the sphere of defense. Strikingly, NATO does not figure as an explanatory variable accounting for the absence of a meaningful defense role for the EU.

In sum, the book is a worthy undertaking but fails to convince. We must await a more satisfactory explanation of the relationship between integration and this often overlooked yet both economically and politically crucial policy sector.

American Foreign Environmental Policy and the Power of the State. By Stephen Hopgood. New York: Oxford University Press, 1998. 262p. \$65.00.

Lynton K. Caldwell, Indiana University

Stephen Hopgood argues for the continued relevance of the state in a world of increasing transnational relations and redefined sovereignty. The case in point is the foreign environmental policy of the United States, particularly the politics involved in the United Nations Conference on the Human Environment (Stockholm, 1972) and the United Nations Conferences on Environment and Development (Rio de Janeiro, 1992). The argument is that the state remains the principal and indispensable actor in a world of global interactions among nations.

Hopgood writes: "As will be painfully obvious to the initiated, the book which lies before you began life as a doctoral thesis. Although extensively revised and updated, it has been an impossible task to rid the text completely of that lack of sophistication so characteristic of graduate work" (p. v). I agree with this acknowledgment. The author's style is dense and detailed. The audience for the book must be almost wholly academic—graduate students and university faculty interested in international relations and environmental policy. The substance is limited to interagency politics in the U.S. government with respect to the UN conferences of 1972 and 1992. A detailed account is given of the interactions of the principal persons involved. Personal interviews, position papers, memoranda, and reports are meticulously recorded.

The subject, the state, has multiple meanings, which allows ambiguity. The most straightforward and simple definition is the statement attributed to Louis XIV: "L'état, c'est moi." In chapter 1 Hopgood takes the reader through the various ways in which the state is conceived and interpreted by political scientists. Distinctions and relationships among state, nation, country, and peoples have been drawn differently by historians, geographers, and political scientists over the years. Among the many designations are nation-states, multinational states, city-states, federal states, and unitary states. There are nations without states, but can there be a political state without territory or people (governments in exile)? Even in fiction, imaginary states must have location and population.

The author explains his interpretation of the state in institutional terms as an actor linking domestic and foreign policies. But he observes that these two areas of policy are dealt with very differently, with "foreign issues empowering the core state to the detriment of peripheral state actors and societal and international pressures" (p. 56). Readers from outside the domains of political theory and international relations will likely find Hopgood's designations abstract and theoretical. I interpret his thesis to relate primarily to the core state, which comprises those agencies and officials who are designated policymakers in international environmental affairs. The principal actor in international policymaking in the United States is, of course, the Department of State. Other agencies have inputs in their special areas. Some, notably the Department of Defense, are able to carry on their own international relations in matters specific to their mission. But in dealing with the United Nations, its specialized agencies, and notably international UN conferences such as those in Stockholm and Rio de Janeiro, the Department of State is the state.

The contribution of this book to American international policy lies primarily in the detail it provides of the maneuvering of personal actors within the core state. The book is replete with who said what to whom. Readers primarily interested in the policies actually adopted may be impatient with the plethora of personal specifics and may have difficulty remembering the bureaucratic status of actors when their name pops up many pages after their first identification. The same holds for acronyms. Editorial policy may determine how often the full name of agencies and offices should appear, but the writing style of this book makes for slow reading and too often necessitates flipping back a number of pages to tie together the course of action.

Some of the errors of fact do not damage the scholarly merits of the book but misinform the reader. For example, the National Environmental Policy Act of 1969 did not establish a Council on Environmental Quality (CEQ) in the White House (p. 64). The CEQ was placed by statute in the Executive Office of the President (EOP), which assists the president in his managerial responsibilities and was established on recommendation of the President's Committee on Administrative Management, its officers subject to Senate confirmation. The act that created the EOP also created the White House staff, whose members are not subject to congressional confirmation and are regarded as personal political assistants to the president. Contrary to the text, the CEQ is not "empowered to demand environmental impact statements from other government agencies and departments on major federal projects" (p. 64). That requirement, which I introduced into the drafting of the act in 1969, is mandatory in Section 102(2)c of the act itself and is enforceable in the courts. The CEQ reviews impact statements but is not empowered to demand that the agencies prepare them—the law does that.

Another misstatement on page 64 implies that the Environmental Protection Agency (EPA) was established "under the terms of the Act," an error repeated on page 139. The EPA is a nonstatutory agency created in 1970 by an Executive Order. A British author may be forgiven for misunderstanding the constitutional and political differences between the EPA and the CEQ and between the CEQ and the White House staff. The New York Times and Washington Post regularly misstate the status and relationships of these agencies. Also, a minor editorial lapse is the misspelling of Audubon throughout the text as Audobon.

Despite the detail-burdened text and some avoidable errors, the book has an informative value for anyone interested in the two UN environmental conferences. It identifies source material upon which other investigators may draw. It is not a history of the conferences but is a significant contribution concerning the role of the United States.

Governing the Frozen Commons: The Antarctic Regime and Environmental Protection. By Christopher C. Joyner. Columbia: University of South Carolina Press, 1998. 363p. \$49.95 cloth, \$24.95 paper.

Creating Regimes: Arctic Accords and International Governance. By Oran R. Young. Ithaca, NY, and London: Cornell University Press, 1998. 230p. \$35.00.

Robert Friedheim, University of Southern California

The Arctic and Antarctica are cold, remote, and lightly touched by human use but important to the fate of the world, especially in terms of the effect of possible weather and climate alterations and increased resource use. Those concerned with international institutional creation often cite the polar regimes as examples of successful international resource and environmental regimes. In short, they are "models." The similarities can be pursued for analytic purposes;

for example, both can be characterized as "clubs." Sandler and Tschirhart ("The Economic Theory of Clubs: An Evaluative Survey," *Journal of Economic Literature* 18 [December 1980]: 1482–1521) define a club as "a voluntary group deriving mutual benefits from sharing one or more of the following: production costs, the members' characteristics, or a good characterized by excludable benefits" (p. 1482). The polar regions share the last two attributes. But there are also important differences that other scholars, more commonly non-American scholars, would emphasize as the more important features.

Both Joyner and Young are concerned with the creation, maintenance, and implementation of international polar institutions, but they go about their analytic efforts in very different ways. Joyner is a professor of international law and, not surprisingly, pursues his analysis using the tools of law, history, and international relations theory. Young, a major figure in the new institutionalism, is both theorist and empiricist, a valuable combination. Both have produced books that should be read by scholars concerned with international environmental and resource institutions.

Joyner provides a full and rich description of the development and operation of the Antarctic Treaty System (ATS)the Antarctic Treaty itself (1959), the Agreed Measures for the Conservation of the Antarctic Fauna and Flora (1964), the Convention for the Conservation of Antarctic Seals (1972), the Convention for the Conservation of Antarctic Living Marine Resources (CCALMR, 1980), the abortive Convention on the Regulation of Antarctic Mineral Resource Activities (CRAMRA, 1988), and the protocol to the Antarctic Treaty on Environmental Protection (1991). He shows how states that have made territorial claims and those that have not were able to put aside their differences and "freeze" claims so that agreement could be reached; how opposing sides in the Cold War also put aside differences and cooperated in managing the "frozen commons," including agreeing to inspection schemes and arms control.

Joyner traces the development and operation of a two-tiered governance system that differentiated between the first-class members (my description) (consultative parties, or ATCPs), who have year-round scientific stations in the Antarctic region, and second-class members (nonconsultative parties), who only have "substantial scientific activity" in the region. He also describes efforts to patch the weaknesses in the original treaty, which failed to provide regime capabilities to manage the region's natural resources. The Agreed Measures, the Seal Treaty, CCALMR, and CRAMRA are direct results of that effort. The development in CCAMLR of a secretariat provided for better management capabilities than allowed in the original Antarctic Treaty.

Joyner views the Antarctic as an open-access commons (mixing legal and economic constructs) and its resources as available in a common pool. He argues it must be treated as a commons because claimants fail the test of effective occupation (p. 81). This despite the fact that he provides all the arguments, made primarily by states in the Third World, that the ATCPs exclude them from their commons rights and arrogate to themselves the right to make regime rules. In short, the ATCPs created a club for themselves. He is especially insistent that "no two commons areas are exactly alike" (p. 44), and he tailors his arguments to the characteristics of Antarctica. Joyner describes in great detail the effort under CCAMLR to impose living resource use regulations in the region's maritime space (the Antarctic Convergence), the work to develop environmental regulations and protection rules related to minerals exploitation through the failed effort to promulgate CRAMRA, and the successful effort to replace

it with the Environmental Protocol. He reviews efforts to regulate science and tourism in Antarctica. He is especially helpful in explaining the significant role played by international environmental nongovernmental organizations (NGOs) in recent regime activities. Although he shows many weaknesses in the details of the regime, Joyner clearly believes that the ATS is a significant development. It does a respectable job of keeping or restoring the region to near pristine condition; it is a model for regime-making.

Governing the Frozen Commons is a big, sprawling book that covers its subject in great descriptive detail. At times I disagreed with the author's interpretations on details, but Joyner includes arguments that allow the reader to disagree. He covers the arguments fully and fairly, and for that reason the book is likely to become a standard reference for those interested in the ATS.

By contrast, Creating Regimes is very focused and tightly written. Young brings together two streams of his work: his theorizing about the nature and functioning of international regimes and his special concern with the Arctic. He tells the "creation stories" of two Arctic accords, the Arctic Environmental Protection Strategy and the Barents Euro-Arctic Region. Both are soft law, both are focused upon creating programmatic rather than regulatory institutions. Young achieves something that is relatively rare: He posits a theory about a political process that especially interests him—creating constitutive international environmental regimes—and tests his analytic construct with data in order to reach empirically validated conclusions. As a result, within the caveats he provides, he makes a wholly convincing case that the two Arctic regimes can be explained using his framework.

Young argues that "conventional" international bargaining analytic tools are inadequate for understanding his stories of the successful formation and implementation of the two regimes. He believes efforts to analyze the regime formation process as a seamless whole are doomed to failure. Instead, he claims what is needed is multivariate analysis. He proposes assessing the two regimes by breaking down the process into three phases: agenda formation, negotiation, and operationalization. Each has different political dynamics, they sometimes overlap, and successful movement from one phase to another is not guaranteed. Using these tools allows Young to show that ideas are important in the agenda formation stage and sometimes acquire a momentum of their own; in the negotiation stage, building consensus is more important than putting together a winning coalition; and in the operationalization phase, which is also a political process, the problem is usually a struggle to obtain the material resources to fulfill the constitutive contract, but the effort is bifurcated into domestic and international levels. For each stage he examines driving forces, players, collective-action problems, context, tactics, and design perspectives.

The way in which Young fits his evidence to his theory is a model of social science analysis. His analytic framework allows him to refine notions for which he is already well known, such as the role of leadership and entrepreneurship in regime formation, issue framing for collective choice, and many others. He adds to it an emphasis on the importance of context for explaining why some ideas get onto the international agenda and others do not. Finally, his work on operationalization has made a significant advance in answering the question of why some agreements succeed and others do not, with its emphasis on understanding both domestic and international aspects of operationalization.

Is Young's latest work a useful guide to further advances in the field? He is appropriately modest and does not make exaggerated claims. Despite his caveats, I am concerned that his cases are a bit too perfect, too similar to prove that his analytic construct will fit other types of regime constitutive processes. First, as he acknowledges, only Arctic states attempted to play a role in these regimes; NGOs played a minor role, especially as compared to their role in the Antarctic. The Arctic is a "club" composed only of members who wanted to get in. One can argue that, owing to Arctic Ocean circulation patterns that distribute persistent organic pollutants (POPS), all states and peoples have a stake in Arctic environmental health and that the regime should not be a club, but only those who share close characteristics or expected excludable benefits were involved in creating the Arctic regimes.

Second, context heavily affects Young's cases. The end of the Cold War made both Arctic regimes possible. Can we expect events as meaningful as this to happen often enough to facilitate creating international regimes?

Third, the regimes in question created programs of action, which are inherently less conflictual than regulatory or allocative regimes. The main problem involved resources; the Russians had trouble coming up with the resources to follow through, and the Americans were reluctant to do so.

Finally, I am skeptical that others will make similar findings using Young's analytical construct applied to more conflictual regime formation constitutive processes. Two cases come to mind—the law of the sea and the whaling regime. In both cases the effort to build a winning coalition rather than an effort to build consensus is more likely to capture their core political processes.

But being the fine scholar he is, Young makes his claims in a manner that is testable. It will be up to another generation of scholars to validate them.

Zones of Peace in the Third World: South America and West Africa in Comparative Perspective. By Aric M. Kacowicz. Albany: State University of New York Press, 1998. 267p. \$21.95.

Edmond J. Keller, University of California, Los Angeles

This exercise in comparative international relations analysis takes a regional perspective rather than a dyadic, diachronic, and evolutionary approach. Kacowicz conscientiously attempts to stand apart from traditional approaches to international relations by endeavoring to explain prolonged periods of interstate peace as opposed to war. He argues that, because conventional theories of international relations (i.e., realism, liberalism) ignore the "phenomenon of zones of peace," there is a need for studies such as this one, which provide "a more complex, eclectic, and original explanation that links international and domestic politics" (p. 2).

Kacowicz defines a zone of peace as "a discrete geographical region of the world in which a group of states have maintained peaceful relations among themselves for a period of at least thirty years—a generation span—though civil wars, domestic unrest, and violence might still occur within their borders, as well as international conflicts and crises between them" (p. 9). He differentiates among three gradations of peace: (1) negative peace, or the mere absence of war; (2) stable peace, that is, no expectations of interstate violence in the region; and (3) a pluralistic security community of nations, in which member states share common norms and are deeply interdependent. Rather than deal with regional relations throughout the world, Kacowicz concentrates on the Third World, in particular South America and West Africa. He suggests, however, that his analytical model can be used to study other regions as well.

The book is divided into five chapters. The introduction deals with some definitional and conceptual issues. Chapter 2 lays out the basic arguments and critiques relevant theoretical literature on the conditions for peace and the causes of war at the state-state, regional, and international relations levels. The author presents a series of competing explanations (realist, liberal, and national territorial satisfaction) for the maintenance of zones of peace by assessing several necessary, sufficient, and favorable conditions for the persistence of different gradations of regional peace. The chapter concludes with a sketch of the theoretical model around which the rest of the discussion is organized. Kacowicz argues that war and peace are overdetermined, and there is no one explanation for either. He suggests that there are myriad alternative explanations to account for these highly complex phenomena (p. 63). He goes on to formulate nine explanations for the maintenance of regional peace, grouped into three basic categories: realist, liberal, and domestic territorial satisfaction. In the process of applying the model, the author indirectly attempts to join the debate over the causes of the "democratic peace." He argues, and presents evidence to suggest, that although democracy may be a sufficient condition for explaining the causes of a zone of peace, it is not a necessary condition.

Chapters 3 and 4 are cogent case studies that employ a structured focused comparative method similar to that used by Alexander George ("Case Studies and Theory Develop-ment: The Method of Structured Focused Comparison," in Paul G. Lauren, ed., Diplomacy: New Approaches in History, Theory and Policy, 1979, pp. 43-68). În the case of South America, Kacowicz attempts to understand why that region has been a zone of peace for such a long time (1883-1996). For West Africa he asks: "Why have there been no wars between states in the region, while so much domestic violence has taken place within them?" The author tediously applies his theory, frequently reminding us that multiple competing explanations might explain this phenomenon (e.g., existence of a regional hegemon; level of economic development; incidence of democratic regimes; geopolitical considerations; strength/weakness of the state; compatibility of major values).

In the final chapter, the author turns to cross-regional comparisons of Latin and Central America; West Africa and other African regions; South America and West Africa; and the regions of South America and West Africa with the Asian zones of peace (northeastern and southeastern Asia). Here, Kacowicz's reach exceeds his grasp. The author does a fairly decent job of structuring the comparison between West Africa and Latin America; he had more empirical data with which to work. He finds that by the end of the period under study, Latin America had entered a condition of widespread stable peace, and it was on the brink of evolving into two pluralistic security communities (MERCOSUR and the Andean Pact). In contrast, West Africa was still at the stage of negative peace. The explanation for the zones of peace in both regions is found to be the satisfaction with the territorial status quo. Also, in neither region was there found to be a balance of power. Regarding the other comparisons in the last chapter, the author can only be suggestive. The argument is logically constructed, but Kacowicz is not able to bring to bear sufficient empirical evidence for the reader to evaluate the effectiveness of applying his model elsewhere. Perhaps he will address this problem in a later research project.

Although this book does not represent a major contribution to the study of international relations, it would serve as a nice device for provoking discussion and debate in courses on comparative international relations. The style is occasionally somewhat cumbersome and the presentation tedious, but there is valuable information throughout and a certain amount of original thinking. Perhaps the greatest limitation is that, by trying to explain extended periods of peace, the author is unable to deal with the implications of the regionalization of international relations following the Cold War. As David Lake and Patrick Morgan show in their edited volume (Regional Orders: Building Security in a New World, 1997), with the end of the Cold War the way has been open for the development of broader and deeper interstate relations in various regions of the world. The tendency now is to enter into regional security pacts not only for political purposes but also for military, economic, and developmental purposes.

International Management of the Environment: Pollution Control in North America. By Emmett N. Lombard. Westport, CT: Praeger, 1999. 198p. \$59.95.

Robert Paehlke, Trent University

Lombard presents a timely and generally competent review of post-NAFTA environmental policy and administration in North America. An assessment of the complex changes in pollution control within and among the United States, Canada, and Mexico since NAFTA is an ambitious undertaking, and this book is a useful beginning. Broadly speaking, the treatment is better with regard to the United States and Mexico than with regard to Canada or at the level of integrated administration, but even where it is less thorough than it might have been, the book is reasonably effective.

One strength is that the post-NAFTA changes in environmental policy in North America are generally treated within the broader context of economic globalization. The recent trend to voluntary controls within all three nations has serious shortcomings but is nearly irresistible in a global context of accelerated product development and just-in-time manufacturing that create a "pace of change . . . that is much faster than the processes of regulatory agencies" (p. 9). Lombard also briefly discusses recent public doubts in all three nations regarding any positive role for government and the power this places in the hands of organized interests.

The book is also well structured and quite comprehensive. It considers national environmental protection efforts in each of the three nations (chap. 2) as well as the responsibilities and actions of provincial, state, and local governments within each jurisdiction (chap. 3). Chapter 4 discusses public participation and nongovernmental organizations, and chapter 5 considers several examples of regionally based environmental controls, such as the Great Lakes Regional Toxic Emissions Inventory and the Border XXI Project. The latter is directed at the notorious environmental problems especially but not exclusively on the Mexican side of the U.S. border. Lombard, writing in 1998, is unable to draw firm conclusions about the effectiveness of the Border XXI project, but he does note that pollution control expenditures within Mexican border states have increased significantly in recent years.

Nearly absent from the discussion of regional initiatives, however, is the North American Commission for Environmental Cooperation (NACEC), the multilateral agency created by the North American Agreement on Environmental Cooperation, the so-called NAFTA Side Agreement initiated by President Clinton in 1993. Lombard argues that such "consensus-seeking" entities, this one composed of the environment ministers of the three nations, "have only limited usefulness as dispute mechanisms" (p. 8). He notes that public (as distinct from governmental) initiatives are very

limited within the rules of NACEC, but he does not examine in detail the several cases in which this body has failed to act when it might have. He also does not discuss the ways in which NACEC has at times perhaps had a positive effect (as from the publicity obtained for its ranking of total pollution emissions within subnational jurisdictions).

The book might have been improved by more detailed information on recent reductions in environmental protection expenditures by the Ontario and Canadian governments. Lombard notes (p. 168) the importance of accurate emissions inventories and other forms of environmental information in an era of voluntary reductions and decentralized enforcement, but he fails to comment on the scale of post-1995 radical cutbacks to environmental protection agencies within Canada's industrial heartland. These were not unrelated to declines in provincial and federal revenue in the early 1990s, which in turn could be linked to the process of economic rationalization accelerated by NAFTA. Despite the recent return of Ontario to prosperity and the achievement of a federal budget surplus, the cuts have not been restored due to the struggle to harmonize Canadian tax rates with those south of the border.

Aside from these relatively minor limitations, this book makes a very important contribution. It provides one of the closest comparative examinations of environmental protection in all three nations, and through that window can be seen many of the issues that the world will face as economic integration and trade regimes advance. Lombard provides a balanced view that assumes neither a runaway race to the bottom nor a smooth and automatic advance of environmental protection, proceeding in lockstep with economic growth. He documents a general retreat in public participation opportunities, but he sees as well that some new regional and voluntary approaches to environmental protection are not devoid of opportunities for improvement, especially perhaps in Mexico, where there is a very long way to go. Overall, this book provides us with a better sense of what works and what does not in terms of offsetting some of the possible negative environmental pressures inherent in global and regional economic integration.

Justice, the State, and International Relations. By Leo McCarthy. New York: St. Martin's, 1998. 277p. \$65.00.
Justice among Nations: On the Moral Basis of Power and Peace. By Thomas L. Pangle and Peter J. Ahrensdorf.
Lawrence: University Press of Kansas, 1999. 362p. \$45.00.

Louis Rene Beres, Purdue University

If justice is to be found anywhere in global society, it coexists with mountains and mountains of corpses. A terrible narrative without evident closure, the human record of war and atrocity is now so enduring and overwhelming that even a brief mention of justice seems out of place. Yet, strange juxtapositions need not blot out all hope, and there is ample reason to recall and reaffirm a line by the Greek poet Odysseus Elytis: "Those who committed evil have been taken up by a black cloud" (Odysseus Elytis, Selected Poems, 1981, p. 42).

Thomas Pangle and Peter Ahrensdorf are committed to the imperative centrality of justice in global society and to the associated relevance of political thought. In a very carefully constructed and systematic assessment, *Justice among Nations* self-consciously seeks a proper reconciliation of political theory with the discipline of international relations. Moreover, they seek to provide "a synoptic, critical introduction that would clarify the distinctive core of each of the most important philosophers' conceptions of international justice, that would indicate the historical relationship among these alternatives, and that would bring them into mutually illuminating juxtaposition and contrast" (p. 1).

The effort succeeds admirably, combining a graceful look at the contemporary forces of globalization with in-depth consideration of pertinent intellectual history, from Thucy-dides and Plato to Morgenthau and Waltz. As the discipline of international relations has regrettably distanced itself from the great works of political theory, Pangle and Ahrensdorf make a strong case for narrowing this distance and returning to an inquiry with moral compass. The chapter entitled "Classical Cosmopolitanism: The Stoics and Cicero" is especially useful, as it brings the reader back to an important discourse that is too often ignored by current students of international relations.

Justice among Nations deals extensively with ideas of natural law, ideas that are at the very heart of Leo McCarthy's elegant work. Similar in theme and substance to the Pangle and Ahrensdorf work, Justice, the State and International Relations offers a defense of natural law tradition, attacking both realism and cosmopolitanism as theories of international justice. McCarthy is most compelling and original in his conclusion that "the fundamental principles of international obligation and the fundamental principles of the legitimacy of the state are one and the same" (p. 242). Rejecting the pessimism of the realists, McCarthy offers as best justification for the state one that is essentially pragmatic: It is better positioned than any other political institution to uphold rights and justice.

Both books display substantial lucidity and erudition. Both cover very much the same intellectual terrain, and both accomplish this task in a comprehensive and aptly analytic fashion. Justice among Nations is a more sensible choice as a course text because it brings together a broader array of writers and topics. Furthermore, it looks closely at just war doctrine, considering even Islamic and Jewish perspectives.

In the chapter entitled "The Cosmopolitan Theory of International Justice," McCarthy considers briefly the World Order Models Project (WOMP). I was an early participant in this ambitious academic effort in the late 1960s and early 1970s, and while reading Justice, the State and International Relations I recalled the allegedly "pragmatic idealism" of WOMP, the persistent denunciations of Westphalian international relations, and the more or less insistent calls for global "central guidance mechanisms." The proposed mechanisms of central authority were pretty much the old world government arguments clad in new garments, and in the final analysis, WOMP left the fundamental element of world order reform unreformed, that is, the individual human being. "Out of timber so crooked as that from which man is made, nothing entirely straight can be built" (Immanuel Kant, "Idee zu einer allgemeinen Geschichte in weltburgerlicher Absicht," 1784). Kant's wise remark must be the starting point of all purposeful enquiries into justice and world politics. The world order can never be improved by structural alterations alone; rather, the key imperative of those who seek justice must be to change people.

Both of these books would have benefited from more explicit investigations of human nature and its potential mutability. A principal motif in both is that world politics is always about the struggle for power. Although such thinking is assuredly correct, it also misses a far more important point. The struggle for power in world politics is always epiphenomenal. It is what underlies this struggle, what animates competition between states and human rights violations within states, that represents the problem of world politics. I refer to

the individual's private apprehensions, needs, and terrors, including the desperate need to belong to groups and the often all-consuming (and related) fear of death.

"Everything in this world exudes crime," said the French poet Baudelaire, "the newspapers, the walls and the face of man." Yet, this "face" does not belong solely to what Grotius called "Men of deplorable wickedness" (Hugo Grotius, De iure praedae commentarius, Commentary on the Law of Prize and Booty [1604], trans. G.L. Williams, 1964, p. 90). The real problem of world politics and justice is not the hostes humani geners, or "common enemy of mankind," but the "normal" human being, the one who adheres closely to societal expectations while secretly dreaming of corpses. It was this human being, not the wicked monster of traditional scholarship, who made possible the previous century's many wars and genocides.

Both of these books represent very capable and carefully researched inquiries into justice and world politics. Both, however, could have benefited from a closer look at the essential human underpinnings of world order, the more or less remediable behavioral bases of international relations. Cicero set forth the classic statement of reason and natural law, but it was Nietzsche and Dostoyevsky who recognized that justice must always coexist with unreason and lawlessness.

Risk-Taking in International Politics: Prospect Theory in American Foreign Policy. By Rose McDermott. Ann Arbor: University of Michigan Press, 1998. 242p. \$39.95.

Donald A. Sylvan, Ohio State University

Rose McDermott addresses a significant topic in her work on the applicability of prospect theory to the study of American foreign policy. The book examines such important issues that it should be recommended to students of foreign policy decision making, political psychology, and international relations. It makes an important contribution to our understanding of risk taking in international politics. Greater precision in applying many of the concepts of prospect theory would have made the book even more useful.

To her substantial credit, McDermott offers a context for efforts to understand and evaluate prospect theory. She carefully presents overviews of the Iranian hostage rescue mission, the decision to admit the shah to the United States, and the U-2 and Suez Crises. McDermott is on track in her implicit assumption that for prospect theory to be useful to students of political science and international relations, it must be interpreted and tested with cases such as those she examines. The four cases offer a good range of variation on some important variables, including the president in office. Ideally, cases that could be classified as noncrisis would have been included as well.

In the concluding chapter, McDermott raises the issue of operationalization. To her credit, she acknowledges that this is a troubling issue for the application of prospect theory to the study of foreign policy. Yet, that does not excuse her problems in this area. Specifically, two of the scope conditions of the initial statements of prospect theory by Daniel Kahneman and Amos Tversky ("Prospect Theory: An Analysis of Decision under Risk," Econometrica 47 [1979]: 263–291) are that choices must be seen to be in the same domain and must be seen as close. McDermott does not establish this in all her cases. In fact, it was not clear in all the cases exactly what specific choice was being examined. Therefore, she may not be testing prospect theory per se.

As to the role of risk in prospect theory, McDermott and I

again interpret the theory a bit differently. She assumes that the assessment of the riskiness of a choice is a major part of prospect theory. I interpret the theory as stating that risk influences how individuals weight options. The difference may be subtle, but one would look at different evidence to evaluate the theory's performance depending upon which interpretation one chooses.

McDermott makes a good point in arguing that risk can be seen as partly in the payoffs and partly in the probabilities. A crisper specification of that point in the analysis of the cases would have improved the book. Also, McDermott's treatment of prospect theory as rather deterministic is problematic. In the initial specification of prospect theory, it is set forth much more probabilistically.

In the concluding chapter, McDermott tells us that, "in many ways, prospect theory does not so much simplify political analysis as complicate it" (p. 184). I wholeheartedly agree. Prospect theory should be employed as an adjunct to other important theories and variables that help us understand and explain decisions. When we invoke "prospect theory" in our explanations, however, it should not be in a simplified form. It should be the more subtle version set forth by Kahneman and Tversky, and we should only accept those portions of the theory for which we have empirical verification in the domain of our investigation.

A comprehensive treatment of prospect theory in the context of foreign policy and international politics is long overdue. Risk-Taking in International Politics makes important strides in that direction. This is a good book that could have been even better if it had been somewhat more precise in its application of prospect theory.

Leading Questions: How Hegemony Affects the International Political Economy. By Robert Pahre. Ann Arbor: University of Michigan Press, 1999. 277p. \$49.50.

Brian Pollins, Ohio State University

For ten years following the publication of Robert Keohane's After Hegemony (1984), the subject of system leadership was central to the research agenda in our field. But like a declining hegemon, this once dominant topic faded from our literature for reasons not well understood, despite the fact that the question of order (in the global system as well as in our field) remains unanswered in the post-Cold War era. Another look at the question of international system leadership is warranted, and Robert Pahre offers a game-theoretic analysis of hegemony more detailed than we have seen thus far. Propositions from the model are examined in light of four historical case studies (two concentrating on the United States, two on Great Britam), and selected claims are tested statistically against time-series data. Pahre's chosen subject as well as his blending of formal analysis, statistics, and historical cases is reminiscent of David Lake's Power, Protection and Free Trade (1988). Pahre's game-theoretic analysis is much deeper, but Lake's book remains the best in this genre for its clarity and accessibility to a wider audience.

Leading Questions begins with a very broad one: "What does a leader do when it leads" (p. 8)? Others have addressed this question with the breadth it demands, examining the consequences of leadership (and its disappearance) not only for the global economy but also for interstate conflict. Robert Gilpin's War and Change in World Politics (1981) and George Modelski and William Thompson's Leading Sectors and World Powers (1996) are noteworthy, although the latter is not discussed or cited in Leading Questions. Pahre instead centers his attention on one important aspect of system

leadership: the provision of (quasi-) public goods supporting the governance and operation of the global economy. This book is best appreciated if the reader looks for insights specific to the public goods question, rather than the broader sweep offered by Gilpin and others.

Pahre brings us up to speed quickly with the relevant ideas and claims surrounding hegemony and collective goods provision, beginning with Charles Kindleberger's World in Depression, 1929-1939 (1973). We learn that scholars have considered more than ten public or quasipublic goods that might be provided to the global economy by a hegemon (Kindleberger alone treats five of these), including the countercyclical balancing of capital flows, liquidity provision, and currency stability. We are well into Leading Questions, however, before we realize that Pahre's model and empirical analysis center very much on only one of these goods: the provision of a distress market for the economies of other nations during slack times. There is much to be learned on this question alone, but the author should have made this clear and provided some discussion of how the analysis of this one good might be generalizable to others. As written, the argument slides between broad general claims and specific applications and pieces of evidence without adequate foundation. The insights and novel findings that might have been gained from this study are much less clear as a result.

Pahre presents his basic model in chapters 2 and 3. Thereafter, in chapters that alternate between historical narratives (interspersed with occasional statistical tests) and further elaborations of the basic model (to explore security concerns and the implications of repeated play), the argument unfolds, revealing many surprises. Foremost among these is Pahre's claim that Charles Kindleberger and Mancur Olson are wrong to associate the quantity of public goods provided with the concentration of resources in the hands of one or a few (p. 29). The very simple formal model generates what Pahre calls the "nonconcentration hypothesis": The distribution of resources among actors is irrelevant to the quantity of public goods provided to system members. This result flies so directly in the face of so much work on collective goods that it deserves more explanation-particularly for the nonspecialist in formal models—than one finds in Leading Questions. We are told that Olson's model was not so explicitly game theoretic since it assumed independence among the choices made by actors, and this "probably accounts for the difference between [Pahre's] claim and many scholars' intuition about the public goods problem" (p. 30). Probably? Fuller exploration of this and other points is

Might the dramatic difference in the results of Olson and Pahre instead be due to other simplifying assumptions made by Pahre? Since his analysis looks only at the "distress market" aspect of public goods, he elects to use the volume of imports as the lone indicator of public goods provision (by any one nation as well as in the system overall). Since the willingness to import by any one nation does us as much good as any other (e.g., why should we care whether it is the Americans, the Germans, or the Canadians who are willing to import our goods?), Pahre tells us that these national markets are perfect substitutes for one another. This might be useful when it comes to distress goods (formal modelers should be granted a fair degree of latitude in their assumptions, for they do offer a unique clarity in their logic), but it is less clear, for example, that the Canadians are just as capable of contributing to global currency stability as the Americans or Germans. Concentration of resources might matter after all.

Other aspects of the book's presentation get in the way of

our understanding. For example, "formalization... requires an explicit definition of hegemony" (p. 14), yet the reader is hard-pressed to find one. Soon thereafter, Pahre states that he assumes a hegemon has always been present in the system since 1815, so there is "no variation in the independent variable for the key hypotheses of the theory." But whether or not one expects variation in any indicator depends first on one's operational definition of that variable. Hence, the missing definition of hegemony leaves us handicapped from the outset of this study. Pahre shows that falsifiable second-order predictions can still be generated by the model, and he argues that when they are not falsified, we may infer that first-order claims and characteristics of the model are themselves "not false" (p. 15). Many readers will find this means of testing to be overly tortured.

If the model's presentation and the marshaling of evidence are unconvincing, the book remains intriguing. Pahre draws us back to a subject eminently worthy of further study. His application of game theory to this subject is more extensive than we find in this literature, and the conventional wisdom on the subject deserves a challenge as stiff as he attempts. From this challenge come gems for future research. How does the security environment alter incentives for hegemons to provide collective goods? Might some goods be more readily provided to the system than others? Pahre began by asking what a leader does when it leads. This book gives us glimpses of a broader question: When, if ever, does the system require leadership for collective goods provision? Without the model offered here, the question would not be framed this way.

International Order and the Future of World Politics. Edited by T. V. Paul and John A. Hall. Cambridge: Cambridge University Press, 1999. 421p. \$64.95.

Donald J. Puchala, University of South Carolina

This book was inspired by an interdisciplinary dialogue about contemporary international relations between the two editors, T. V. Paul, a political scientist, and John A. Hall, a sociologist. At a conference at McGill University in 1997, they elaborated this dialogue into a conversation among a number of well-known scholars, whose respective contributions became the volume under review. The object of the project was to determine what social science may have to offer to the better understanding of international order after the Cold War.

The book has some notable strengths, although these are largely to be found in the insights of several of the individual contributors rather than in the volume as a whole. There is, for example, a remarkable essay by T. J. Pempel, in which the author extracts conclusions about the future of Japanese foreign policy from his deep understanding of Japanese domestic politics. Japan not only will continue to shrink from leadership in world affairs, but also, Pempel reckons, it will experience intensifying strains from forces of globalization. In his imaginative contribution, Jack Snyder identifies Russia as a "declining power." He asks analogically whether Russia will decline in one of the ways that major powers have declined in the past, and he plausibly concludes that growing marginalization will render Russia increasingly irrelevant on the world stage. Michael Mann's essay on globalization and the fate of the nation-state is a tour de force both analytically and conceptually. Globalization, Mann points out, is best envisaged as adding new networks of human interaction that supplement but do not replace already existing national and local ones. Also impressive is Jack Goldstone's thorough,

plausible, and very discomforting analysis of the effects of demographic trends on the politics of the twenty-first century. Goldstone's essay could well turn out to be the most prescient in this collection.

Readers seeking edification from *International Order* are advised to read selectively. For one thing, the parts do not hang together. This appears to be partly due to the well-intentioned but unsuccessful attempt to bridge disciplines, which results here in juxtaposed discourses instead of productive interdisciplinary communication. Also, there is a rather notable lack of conceptual consistency. Even the definition of "international order" varies from author to author, with some avoiding the idea altogether, and there are differing renditions of such concepts as "state," "nation-state," or "security."

There is also a disjuncture between the theoretical first part of the book and most of the remainder. After the theorists have their say in the opening chapters, what they have said is largely ignored by the rest of the authors. This could well be because the theoretical offerings are, in this collection at least, of little relevance. In the esoteric, elaborate, elegant, formalistic, and abstract ways of international relations theory today, the contributing theorists tell us many things that we already know or that common sense readily recommends. For example, we are told by Michael Mastanduno and others that we live in a unipolar system in which the United States is dominant. Military conflict among the democracies of the "northwestern" quadrant of world affairs is improbable, Michael Doyle explains, because democracies do not fight one another, and among these countries there is precious little to fight about. In their own chapter, the editors rediscover that prudential statesmanship contributes to international order, but exactly how this truism integrates realism and liberalism, as Paul and Hall attest, escapes the reader. Lisa Martin assures us that international institutions matter, although how they matter remains puzzling to her, admittedly, and to others expectantly wanting to know. By taking a constructivist and mildly postmodern stance, Steve Smith contributes the only genuinely imaginative essay to the theoretical section. International orders, as Smith points out, are indeed constructs that can and ought to be deconstructed down to their normative cores.

The fundamental flaw in both the project that produced International Order and in the book itself is that the editors apparently had a position regarding international politics after the Cold War that they wished the conferees to confirm. Clearly, the editors (as well as several of the authors) accept as real that the post-Cold War world is not qualitatively different from the universalized Westphalian system, Bullian "international society," that preceded it. That nation-states remain the principal agents of international politics and that the causes of war and conditions of peace among states must still head the research agenda is the message that the editors wanted to deliver, and their edited volume is structurally biased to deliver it. Why devote nearly one-third of the text to discussing the future of the major powers and almost no space to international organizations, nongovernmental organizations, or international social forces? Why dwell theoretically and substantively upon international politics, largely depicted as geopolitics, and neglect international political economy? Why push ideological, cultural, ethical, and legal issues to the margins of concern, when among many of the world's peoples today these are matters of central concern? Why recruit a corps composed of North Americans onlywell credentialed as they are—to ponder issues of international order, when analyzing the workings of the post-Cold

War world is today a preoccupation of capable thinkers on all continents?

Despite the biases of the Paul and Hall design, glimpses of a very different kind of world politics are detectable in some of the essays. This is a world politics of emergent disorder and institutional and environmental collapse; international agendas are set not by geopolitical aspirations and calculations but by imperatives to respond to internally driven events. It is also a world in which North and South are highly polarized, the distribution of well-being is a primary issue, culture is a sanctuary, ideologies mobilize discontent, and power is diffused among a variety of agents. Of course, states represented by national governments will continue to strut and fret about as they conduct twenty-first-century international politics, but the significance of international politics per se is likely to be much reduced. Some of the contributors to the Paul and Hall volume say this. They are right.

In the Shadow of Power: States and Strategies in International Politics. By Robert Powell. Princeton, NJ: Princeton University Press, 1999. 310p. \$55.00 cloth, \$19.95 paper.

R. Harrison Wagner, University of Texas, Austin

A person who buys this book will get not one book but two. One is a major contribution to our understanding of some important issues that have been debated by students of international politics. At the center of these debates has been Kenneth Waltz's claim that to understand international politics one must understand the implications of the anarchic environment in which it takes place. The other book is an intellectually distinguished contribution to recent debates about the merits and demerits of formal rational choice theory in political science. At the center of these controversies have been Donald P. Green and Ian Shapiro's Pathologies of Rational Choice Theory (1994) and a recent article on the role of formal models in security studies by Stephen Walt ("Rigor or Mortis? Rational Choice and Security Studies," International Security 23 [Spring 1999]: 5-48).

It is hard to deny that states exist in an anarchic environment, which implies that every state must confront the possibility that other states will use force against it. It is also plausible to assume that the leaders of states prefer not to be attacked and defeated by other states, and that they think carefully about what they should do to avoid such an outcome. The neorealist school of international politics, which is largely but not entirely based on the work of Waltz, has claimed to derive strong conclusions about the behavior of states from weak assumptions such as these. Thus, neorealism has always been a theory of rational behavior (although one that is ignored by critics of rational choice theory, such as Green and Shapiro), and Waltz claimed to be emulating microeconomics. Yet, scholars disagree about what conclusions, if any, such assumptions imply. The result is a variety of schools of thought within the neorealist camp as well as competing doctrines, such as neoliberalism and constructivism. The main message of Powell's book is that many of the arguments advanced by participants in these controversies are not valid, and constructing valid arguments about these issues is harder than is commonly assumed.

The book is organized around three ways a state can try to cope with external threats: It can mobilize its own resources, try to compromise, or rely on other states for assistance. An analysis of the first response leads to the question of whether states will want to maximize their power and will be concerned with only relative rather than absolute gains in dealing with other states. Prominent scholars claim that we should expect both to be true. Powell's analysis implies that they will do neither and that a peaceful equilibrium is possible. An analysis of bargaining over the terms of a negotiated settle-

ment as an alternative to fighting leads to an examination of the relation between the distribution of power and the probability of war, the conclusion of which is that neither the balance-of-power nor the preponderance-of-power schools is right. And an analysis of the choice of allies leads to the conclusion that we should not expect states to "balance" against other states, as Waltz and others claim.

Much of this analysis has been published in journal articles. Moreover, the three responses to external threats are discussed in isolation from one another even within this book, since bargaining or alignment are not options in the discussion of mobilization, mobilization or alignment are not options in the analysis of bargaining, and bargaining and mobilization are not options in the discussion of alignment decisions. What unites the analysis of these issues is instead a discussion of the role of modeling in the study of politics, in which these analyses serve as examples. Powell concentrates on making the reasoning in each of these analyses as easy to follow as possible, including the choices that were made in setting up the models. An integrated analysis of how states respond to external threats is left to future work (or, perhaps, as an exercise for the reader).

Powell's discussion of "the modeling enterprise" makes clear that what divides formal modelers from their critics is mainly the emphasis the modelers place on constructing logically valid arguments. In his critique of formal modeling, Walt obscures this issue by focusing instead on "logical consistency and precision" and "empirical validity" as criteria for evaluating scholarship. On the one hand, a logically consistent argument is not self-contradictory. A valid argument, on the other hand, is "so constructed that if the premises are jointly asserted the conclusion cannot be denied without a contradiction" (Random House Dictionary of the English Language, 1987). Arguments can be consistent but not valid, in which case they do not work, since even if one accepts the premises, one is free to deny the conclusion. Walt claims that it is relatively easy to avoid contradictions and points to several nonformal works in the social sciences as examples. No one who reads Powell's book could possibly think that it is easy to construct interesting valid arguments about international politics or overlook the fact that the literature is full of invalid ones.

· One might think that in evaluating explanations logical validity is less important than factual evidence. Yet, only if observed facts can be derived from an explanation can they be explained by it, and only if we have some prior reason to believe the explanation might be true can the facts provide evidence that the explanation is true. Often a deductive argument is the only way these conditions can be met.

Logical validity is not the only desirable property of an argument, but it is a condition that must be met before other criteria become relevant. Of course, before an argument can be shown to be valid, someone must first guess that it is, and therefore the greatest scholars are also the greatest guessers. Not all guesses are correct, however, and, contrary to Walt, expertise in modeling need not interfere with one's ability to make inspired guesses. No one knows for sure how to encourage inspired guesses, of course, but this book is one of the best guides available to what must be done if one wants to determine how inspired any particular guess about international politics really is.

Alliance Politics. By Glenn H. Snyder. Ithaca, NY: Cornell University Press, 1997. 414p. \$39.95.

John Conybeare, University of Iowa

This book is based on the premise that "neorealism does not say much about what causes states in a multipolar system to identify each other as friends or enemies or about the

consequences of such identification" (p. 32). Snyder synthesizes his considerable stock of accumulated wisdom on alliances in easily accessible game theory, illustrated with his impressive historical knowledge of alignments before World War I. He sets out a large array of factors that affect alliance politics, and he shows many permutations of alignment payoffs using simple variable-sum games. He is at his best in offering insights into the diplomatic tactics and motives of the

Overall, however, the book does not offer a great deal that is new. Parts of it are reprints of earlier work. The historical content, apart from Snyder's speculations about tactics and motives, is easily available from the many diplomatic histories of the period. Considered as a work of theory, the book is less satisfying than one might hope. There is the familiar expected utility equation with the usual variables (p. 47) but (unlike, say, the work of Bueno de Mesquita) there is no indication of how such an equation might be tested. Once into the case studies, Snyder assigns payoffs to alliance behaviors, but these numbers appear to be rather arbitrary and are not

obviously tests of the expected utility equation.

Snyder offers general hypotheses on alliances (p. 74), from which are derived the hypotheses that he applies to his cases. The problem is that these hypotheses are not particularly remarkable: "The least dependent partner will enjoy the most influence," "allies with the most interest at stake in bargaining encounters will have the most influence," and "the more firmly a state is committed to defend its ally, the less influence it will have in intra-alliance bargaining" (p. 199). These theories are rather close to tautologies of the following type: In the absence of imperfections in alliance markets, efficient allocations of resources will ensue (i.e., resources will go to those who value them the most). Tautologies are not necessarily useless, since they may direct us to the most interesting aspects of a phenomenon (e.g., if we know that banks would not exist in the absence of costly information, this tells us to look at exactly how banks overcome gaps in information). Nevertheless, the hypotheses that Snyder tests with his intuitive measurements are likely to disappoint some

This book exhibits a deep appreciation of diplomatic history, and it is a splendid work of historical commentary that offers many interesting inductive generalizations. It is also a gold mine for scholars of alliances who are looking for issues worthy of further explication, either historically or theoretically. Students will also find it valuable because it pulls together many of the recent developments in the alliance literature (e.g., security and autonomy tradeoffs), although some of this contemporary work is accepted rather uncritically. In discussing "balancing" and "bandwagoning," for example, Snyder seems to assume that one knows which of these motives one is observing, but frequently this may be unclear. When Rumania joined the Tripartite Pact in 1940, was it bandwagoning with Germany or balancing against a Soviet Union that had already devoured parts of it neighbors?

Regional Orders at Century's Dawn: Global and Domestic Influences on Grand Strategy. By Etel Solingen. Princeton, NJ: Princeton University Press, 1998. 334p. \$72.50 cloth, \$20.95 paper.

Richard Rosecrance, University of California, Los Angeles

Solingen has written an extraordinarily interesting book. Rarely are we offered new independent variables that help explain or even determine typical international relations outcomes war, militarized disputes, peace, or economic relationships—between states. Solingen has done so. Her

"Internationalist coalitions" are an important arrow in the quiver of causation as applied to grand strategy and regional conflicts. That domestic variables are important influences on grand strategy has been shown previously. Stein and Rosecrance, Kupchan, and Snyder have already made this point. What Solingen does is focus on internationalist or liberalizing coalitions in the explanatory process. In her analysis these turn out to be more important than democracy, institutionalism, or realist factors in determining grand strategy. Rather than concentrate on a "large n" analysis that might apply historically, Solingen seeks to explain conflict and cooperation within regional orders under conditions in which there is (1) an integrated global economy, (2) a web of international and regional institutions, and (3) a revival of nationalist and confessional influences. In other words, she attempts to account for the international system at the onset of the twenty-first century. Her focus is the southern cone in Latin America, the Middle East, the Korean peninsula, and by application South Asia, Russia, Taiwan, and China. Her argument is that internationalist coalitions are not the necessary condition for peace among regional-neighbors, but they are the sufficient condition.

Democracy, institutionalism, and realism do not meet this standard. Democracy and institutionalism are supposed to act to prevent war among regional neighbors, but war can nonetheless occur between weak or unstable democracies (India and Pakistan), and conflict can take place in the Middle East despite the heavy network of institutionalism of the Gulf Cooperation Council and the Arab League. Realism is supposed to expect conflict unless there is a local nuclear balance. Yet, conflict has not occurred between North and South Korea, even though the South Koreans gave up nuclear ambitions in 1975. Conflict has not taken place between Taiwan and China, even though Taiwan got out of the nuclear business in the 1970s. If restraint still exists, it is because of the development of internationalizing coalitions, inchoate on one side and well established on the other, that link the contending parties.

Solingen accepts the conclusions of Mansfield and Snyder that democratization is a conflictual process, with a plethora of log-rolling coalitions domestically. Stable authoritarian nations inhabited by liberalizing or internationalizing groups, however, may be much more peaceful. From her standpoint, the American pressure for democratization and human rights is a mistake if there is no internationalizing coalition in place. One worries about Russia because a quasi-democracy has been established without a powerful liberalizing coalition. This is not true for most of Eastern Europe, although it does apply to Serbia.

Logrolling emerges in a cartelized polity in which there is no solid, largely unchanging moderate majority for policy. Extremist outcomes can then emerge that are favored by no particular faction in the logrolled coalition. Under presentday circumstances, statists and confessionals may establish a joint log roll, but agreements with liberalizers are more difficult to form. Sometimes they can agree, however, as in the case of Pinochet's Chile, where the military associated with economic liberalism. De Gaulle's France could liberalize economically because the defeated military in Algeria were paid off with higher arms spending. A somewhat similar logroll occurred in Indonesia. Such coalitions are not likely to endure, however, because liberalizers seek ultimately to cut the military budget and to persuade the armed forces that a stronger economic mobilization base is more important than more military spending. Solingen makes a persuasive case that the instances of denuclearization detailed in Mitchell Reiss's Bridled Ambition (1995) are largely to be accounted

for by liberalizing coalitions in place or influencing those in power.

There seems little doubt that internationalist coalitions exert an important effect upon the possibility of peace. But what explains the origin of such coalitions? On this point Solingen is less clear. In the case of Taiwan and South Korea, it was the sudden check administered by the United States to a nuclear and statist strategy. In other cases it was the reinforcement or insistence by important international agencies, such as the IMF and the World Bank, that countries internationalize their economy if they wished to gain external financial support. In some instances "emulation effects" may have been dominant, in that countries observed the success of such nations as Japan, Singapore, and Germany and wished to follow in their wake. In still others, the possibility of becoming a "virtual state" with high-level services concentrated at home and production abroad may have attracted attention as the rewards of such status grew. In certain cases an economic crisis like that of 1982 in Latin America and 1997-98 in East Asia stimulated liberalization to surmount

Solingen, however, is in no doubt that states follow a risky course as they enter the "valley of transition" from a statist/ confessional coalition to an internationalist one. Military spending will be cut, and state industry will be put out of business, with attendant unemployment. Until foreign investment enters and new export industries develop, political and economic uncertainty will govern the outcome. As one paramount example of Solingen's point, China is now entering a "valley of transition" in both Przeworskil's and Solingen's terms. Despite the recent crisis, China did not suffer a major economic reverse, which definitively moved Chinese politics in a liberalizing direction. Beijing possesses both a statist coalition and a liberalizing one. In the Korean case, the United States administered a check to the statist group in the mid-1970s, but it can hardly do this in China. Such an attempt would more likely guarantee the success of statism and the defeat of liberalization. More important is that other countries help the Chinese leadership develop incentives (Ilqui bonoll gains), which can convince statists and the unemployed that their longer term benefit resides on the side of further economic liberalization. Pressing for political liberalization and human rights, however, despite the democratic peace hypothesis, can only be counterproductive. Solingen has written a book that not only is generally correct but also has implications that can inform policymakers in many parts of the globe. Economics first, politics second.

In the Hurricane's Eye: The Troubled Prospects of Multinational Enterprises. By Raymond Vernon. Cambridge, MA: Harvard University Press, 1998. 262p. \$35.00.

Randall J. Jones, Jr., University of Central Oklahoma

This is Raymond Vernon's last book, published the year before his death, and it is a fitting literary conclusion to a long and distinguished career. It demonstrates once again the insightful, balanced analysis to which students of multinational corporations have become accustomed in Vernon's writings. For more than a quarter-century Vernon focused on the uneasy relationships between multinational enterprises (MNEs) and national governments. He recognized that tension is inherent in these relationships but argued that it must be kept to manageable levels. That could best be achieved, he believed, by maintaining balance—equilibrium—in patterns of reciprocal influence between firms and governments. That goal was always elusive, however, and there likely was never

a time when he thought that such equilibrium existed. In his 1971 classic, Sovereignty at Bay, Vernon documented the growing power of American multinationals and was concerned that the scales were weighted too much in their favor. This theme continued in later work as well.

By 1998, however, Vernon's primary concern seemed to shift. In the Hurricane's Eye highlights his belief that the balance may be tilting too far against MNEs. In fact, his main argument is that MNEs are threatened by unprecedented tensions and pressures—primarily from governments—that may impede their effective functioning. Vernon sees this as a particularly troubling prospect because MNEs have been, and continue to be, the engine of world economic growth.

Vernon's earlier work emphasized problems in dealing with host governments, but today the greatest source of tension for MNEs is the relationship with their home government. Vernon sees negative home-government policies toward MNEs as being largely driven by unions, mobilized in response to the loss of jobs to foreign workers and the perceived threat to the labor safety net. He also observes a more fundamental demographic problem, the aging population in many industrialized countries in which MNEs are based. Jobs for working-age people are critically needed to support nonproductive elements of the population through old-age insurance programs. Growing awareness of this consequence of jobs lost to foreign investments has meant that labor's concerns find support among other key groups in industrialized countries. From this perspective Vernon is pessimistic as to the outlook for MNE-government relations, for the problem is endemic in society and may be beyond the control of either.

Vernon also stresses the negative consequences for MNEs of conflicts among governments seeking to exercise jurisdiction over them. What are companies to do when the home government attempts to impose jurisdiction over their foreign subsidiaries, especially to promote unrelated foreign policy goals, which then cause the subsidiaries to run afoul of

host government policies? A persistent, if less dramatic, jurisdictional issue concerns taxation. Progress has been made through international agreements to avoid double taxation, but Vernon notes that issues related to the tax consequences of intrafirm transfer pricing remain.

Vernon addressed similar jurisdictional issues in previous work. By the late 1990s, however, he believed the problem was being compounded by additional conflicting demands made on firms by regulatory entities other than national governments—subnational state and local governments, international regional organizations (notably the European Union), and global organizations.

Vernon observes that structural changes in the international environment have been especially challenging for MNEs, notably the collapse of the Soviet Union and the rise of independent, chaotic Russia and CIS states; the wave of democratization throughout much of the world; and the further integration of Europe. One consequence of democratization that Vernon stresses is privatization of government-owned firms. Privatization has provided MNEs significant opportunities but at considerable risk in sensitive sectors. Vernon clearly is concerned that MNEs investing in petroleum, utilities, and banking may have forgotten the lessons of the 1970s: Nationalization is always a possibility if nationalism is rekindled. This eventuality cannot be ruled out, given the fragile economies and equally fragile democratic institutions in many countries.

The bottom line of Vernon's analysis is that MNEs are vulnerable, and a well-functioning international economy requires that tensions with governments and other political entities must be effectively managed and, it is hoped, reduced. This book's emphasis contrasts with Vernon's earlier stress on the power of MNEs, but *In the Hurricane's Eye* underscores that Vernon was always a pragmatist, not committed to preconceived notions, and willing to reinterpret concepts in the light of changed circumstances.

fellowships

AAAS Science + Technology Policy Fellowships 2001:02

Uhat >>> Help shape science and technology policy in Washington, DC Contribute scientific and technical information and external perspectives to federal decisionmaking, while learning how government works. The AAAS fellowship programs provide a unique perticipatory public policy experience for scientists and engineers, through one-year assignments involving domestic and international science policy Issues in the Congress and several executive branch agencies. Stipends typically range from \$48,000 to \$52,000.

★ ho >>> Applicants must have a Ph D. or equivalent doctoral level degree at the time of application in any physical, biological or social science, any field of engineering, or any relevant interdisciplinary field. Engineers with a master's degree and three years of post-degree experience also may apply U.S. citizenship is required. Federal employees are not eligible. Political scientists are especially encouraged to apply. Approximately 50 fellowships are awarded each year, in nine different programs.

line n >>> The fellowship year begins September 1, 2001. Fellows attend a two-week onentation before beginning their assignments, and participate in a yearlong seminar series on topics relevant to science, technology, and public policy. Application deadline is January 10, 2001.

➡here >>> Fellows are placed in the Congress, the National Science Foundation, the National Institutes of Health, the Department of State, the Department of Defense, the Agency for International Development, the Environmental Protection Agency, the Department of Agriculture, the Food and Drug Administration, the Department of Justice, and other federal offices

liny >>> AAAS sponsors these programs to provide the opportunity for accomplished and societally aware scientists and engineers to participate in and contribute to the public policymaking process of the federal government. The programs include:

- Congressional Science and Engineering Fellowship Program
- + Roger Revelle Fellowship in Global Stewardship
- + AAAS/NIH Science Policy Fellowship Program
- + Science, Engineering, and Diplomacy Fellowship Program
- + Risk Policy Science and Engineering Fellowship Program
- Defense Policy Science and Engineering Fellowship Program
- + Technology Policy Science and Engineering Fellowship Program
- + Environmental Science and Engineering Fellowship Program
- + AAAS/NSF Science and Engineering Fellowship Program

HOW >>> For application instructions and further information fellowships eass.org

Editor's Notes

By now most readers will know of the New York Times article on November 4, 2000, reporting a protest against the American Political Science Association in general and the American Political Science Review in particular. The protestors generated a letter signed by 124 scholars, which they sent to the Times and circulated to many colleagues.1 A week later, 98 more signatories were added. The letter raises questions about APSA governance and complains about APSR articles and the equity of our review process. As I have not been included in the protestors' discussions, there may be points of which I am unaware and which might have affected my thinking on the issues. The letter, however, mischaracterizes articles in the APSR and contains substantial misunderstandings about Review procedures and outcomes.

The major question asked in the letter is: "Why does the APSR and why do other prominent professional fora seem so intensively focused on technical methods, at the expense of the great, substantive political questions that actually intrigue many APSA members, as well as broader intellectual audiences?"

Speaking only about the APSR, I would make several points.

Yes, many of our articles use advanced statistical techniques and mathematical modeling, but not "at the expense" of dealing with the great political issues. Rather, the intent is to obtain more systematic and reliable knowledge about them.

In the past five years, we have published articles on human rights; international conflict and war; the tendency of democracies to be at peace with one another; the conflict in Bosnia; public attitudes toward war; international trade; political inclusion and democratization; interethnic cooperation; political processes in the European Union; the conditions of stability in parliamentary systems; political participation and the beginnings of a competitive electoral system in China; democratization in Mexico, Africa, Eastern Europe, and the former Soviet Union; political change in Japan, Latin America, and Israel; the interrelationship of international crises and domestic policies; how different political institutions affect satisfaction with democracy; electoral systems and how they develop; the number of parties under various electoral systems; minority voting rights and majority welfare; minority representation in the U.S. Congress and how best to achieve it; voting rights enforcement; attitudes toward environmental issues; attitudes toward welfare; school choice and its effects on social capital; the effect of jury size on convictions; campaign strategy and voter turnout; the effect of mass media on political attitudes and behavior; public reaction to Supreme Court decisions; political corruption; electoral accountability; organized interests and lobbying; critiques of capitalism; the conditions of

collective action; deliberative democracy; legislative bargaining and coalition formation; strategic positiontaking among elected representatives; how children develop political attitudes; the effect of family life on citizen participation; civil liberties and tolerance; political trust; civic voluntarism; the conditions for self-government; Christianity and republicanism; numerous articles analyzing the positions of both classical and contemporary political theorists on such issues as justice, tyranny, gender equality, the common good, value pluralism, liberalism, and liberty; and many others.

Although many of the articles incorporate technical materials, their topics are the contemporary expressions of the "great, substantive political questions." It is mistaken to conclude only on the basis of numbers or mathematical symbols contained in an article that, ipso facto, the analysis cannot deal with great political issues.

The letter also asks: "Why do the APSA Council and APSR Editorial Board seem to be chosen essentially by their predecessors?" It is hard to guess why things seem as they do to different viewers with varied amounts of information, and evidence bearing on this question should be brought forward by those doing the speculating, not those who are speculated about. The APSR Editorial Board during my tenure was chosen entirely by me, based on my own knowledge of the discipline and on both solicited and unsolicited recommendations received from hundreds of colleagues (some known to me personally and others only professionally) and groups in the discipline. The choice of the editorial board by the editor is the method anticipated by the APSA Constitution and bylaws. One person was selected because he wrote to me saying he had published several articles in the Review and would like to increase his participation by serving on the board. Among my editorial board, none was on the previous board, and only one of the 33 had ever served on an earlier APSR editorial board. During my editorship, the board has been and remains completely independent of any previous editorial board or any council.2

The letter also asks: "Why do so many leaders of our profession not even read, much less submit, to the APSR?" This question needs to be answered by the leaders who do not read or submit, not by the leaders and nonleaders who do. This is a diverse discipline with numerous "leaders" in each of its many subfields. It reflects the fairness and impartiality of our review process that we publish large numbers of articles by young scholars, some of whom are still "nonleaders" but many of whom already can be considered or are rapidly becoming leaders. Furthermore, it would be difficult to pick up at random an issue of the APSR that does not have at least one or two articles by people who

¹ This letter and other related materials are published in the December 2000 issue of PS. PS has invited further comments for future issues.

² At its April 2000 meeting, the APSA Council voted to require council approval of future editorial boards. In view of the suggestion in the protest letter that there is too much concentration of APSA leadership, it is ironic that this change in the bylaws was presented as a reform.

would be recognized as leaders by scholars in more than one subfield. And new leaders are emerging every day. Those who do not read the *Review* may not know who they are.

I have made the point many times over the past five years that APSR articles reflect very closely the types of manuscripts submitted (see, e.g., "APSR Editor's Report for 1999-2000," PS 33 [December 2000]: tables 4, 5, and 7). Unless we adopt a quota system for types of manuscripts, the primary way to achieve greater diversity in what is published is to increase the diversity of submissions. Perhaps the most appropriate question then is why some people, whether leaders or nonleaders, do not submit. The ostensible reason is some variant of "you wouldn't accept it anyway." The letter signed by 222 scholars, for example, proposes that "the current condition of the APSR" could be improved by "revising the APSR reviewing process to seek both to insure that some methodologies are not automatically vetoed and that most articles are of interest to a broad scholarly audience."

As for the second of these standards, since scholars tend to read and write in their own areas of expertise, this may not be a realistic goal. After reviewing about 2,500 papers submitted over the past five years, my own judgment is that very few would appeal across a "broad scholarly audience." In all scholarly disciplines, as knowledge accumulates research tends to narrow rather than broaden, and the focus moves toward analysis of "smaller" issues using finer and more appropriate tools. When the discipline ranges from classical political philosophy to mathematical models of war and peace, the article that appeals to a broad scholarly audience of political scientists may be a chimera. That one could expect to find twenty-five or thirty of them each year to meet the criterion that "most articles [be] of interest to a broad scholarly audience" seems unrealistic in the extreme, and the assumption that such work is more important than detailed scholarship on narrower aspects of the great issues is debatable.

I would suggest that the goal cannot be for each article, or even most articles, to appeal broadly. Rather, the total collection of articles published over a year or two not only should appeal broadly but also should represent the very best work being done in the discipline. Given the APSR citation rate, a widely accepted measure of quality, it seems that we achieve these goals. A recent study of comparative citation rates among ten political science and related journals by the Institute for Scientific Information (publisher of the citation indexes for the sciences and social sciences) found that the APSR ranked first by far on all three criteria of influence used: "impact," the frequency with which the average article in the journal is cited in a given year; "immediacy," how quickly the average article is cited after publication; and "total impact," the number of citations to articles in the journal by all other journals in the ISI database.3 What journal would the critics propose that over time has published a more important collection of articles about government, political processes, and political science than the APSR, and what is the evidence for the claim?

The allegation that some methods are "automatically vetoed" as part of the APSR review process is false. I have described the review process in great detail in my annual reports (published in the December issue of PS each year) and in editor's notes in the Review itself (e.g., the June 1996 issue). In brief, using key words drawn from the submitted manuscript, the APSR interns (advanced graduate students or new Ph.D.s) do in-house research using a database that contains the names and key word fields of approximately 15,000 scholars, online bibliographic databases that permit us to search through publications in thousands of journals, and a variety of search tools on the Internet. We then consult with at least three and sometimes six or seven members of the editorial board about appropriate reviewers for each and every paper. They may choose from among our list of potentials or make additional suggestions from their own knowledge of scholarship in the field of the manuscript and using similar methods. Only when all this input is gathered and organized do I choose reviewers.

The APSR editor is faced with a never ending flow of manuscripts, reviewer choices, and publication decisions for papers that mostly are in fields outside his or her areas of expertise. Why would the editor try to impose an "automatic veto" on papers that would be of interest to readers, especially if their publication would appease the coalition of minorities unhappy with the APSR? There is no such motive; this simply does not happen.

If the review process is fair, if reviewers are chosen from scholars who do similar work with similar methods, why is there a perceived imbalance in our published articles? The letter provides its own answer: Some people in some fields have decided not to submit to the APSR. For example, since August 1995, the Review has received only 33 new manuscripts from 29 individuals among the 222 signatories of the protest letter. 4 Six were accepted, an acceptance rate of 18.2%, almost twice the 9.7% acceptance rate for all other authors, and another six are still pending (including manuscripts still under review and "revise and resubmits" not returned).5 Where is the case for unfairly negative treatment? If the protestors are complaining on behalf of an even larger group of others, how many manuscripts did that group submit, and what was their acceptance rate?

It is difficult to say how many manuscripts the APSR

³ Reported in Table 1 of Lee Epstein, Gregory Caldeira, Micheal Giles, and Gary King, "Report of the Committee on the Puture of

the American Journal of Political Science," April 14, 2000. http://www.indiana.edu/~mpsa/resources/JournalReport.pdf. Accessed November 4, 2000 The ISI ranking presented includes the ten journals with the highest "impact" rates.

⁴ Thirty-two unsolicited manuscripts were received from 28 individuals; an additional manuscript, invited by the editor as a response to a critique, was submitted by another individual.

⁵ The overall acceptance rate was recently reported as 10.1% ("American Political Science Review Editor's Report for 1999-2000," PS 33 [December 2000]: Table 7). Taking into account the new manuscripts received since that report was prepared, our current overall acceptance rate is 9.9%.

should expect from a random group of 222 scholars, but 33 submissions over five years from a group of this size containing as many distinguished academics as the letter signers seems like a rather small number.6 Many scholars who are oriented toward publication in the Review submit quite frequently. The four scholars who have submitted most often in the last five years have submitted a total of 40 new manuscripts, 7 more than all 222 signatories to the letter. The 16 who submitted most frequently submitted a total of 126 new manuscripts and 11 of them had at least one manuscript accepted. Two hundred and twenty-one scholars submitted three or more manuscripts over the last five years and 566 submitted at least two. Given an overall acceptance rate of only 10%, for any author to conclude after one or two rejections that the process is not fair or that it would be hopeless to submit again is unwarranted. In any case, to the extent that the letter signers choose other journals over the APSR, the data refute their claim that unfair treatment is the reason. Any lack of representation of particular subfields or methods results overwhelmingly, if not entirely, from self-selection by authors of where to submit their articles.

Far from wanting to veto any paper, the editor needs to accept a paper every single week of the year to fill the journal, which goes to press on a fixed schedule. It is in the editor's interest to accept as many articles as possible to shake the haunting specter of a blank issue. The editor wants to accept papers. This may be a strange notion to anyone who has not been an editor, especially of a high-quality journal whose reviewers apply very rigorous standards. Even if an editor wanted to impose an unfair review process, the demands of going to press each quarter would not allow it. For every paper on every subject from every author, whether graduate student or endowed chair, the goal is always to structure the fairest possible review process, calling on reviewers who do similar research, so that each paper will have as good a chance to succeed on its merits as any other.

Although the protest group's relatively small number of submissions and higher than normal acceptance rate seem sufficient to refute the charge of bias, one also should consider the extent to which the signatories have been willing to devote their time to evaluating manuscripts of the type they would prefer to see published. The APSR enjoys enormous cooperation from a very large number of reviewers. The large majority of reviewers never turn down requests, even several times per year. Not counting members of the editorial board, over the last five years requests to review have been sent to 2,284 individuals, of which 1,577 (69%) have provided between 1 and 29 reviews without ever declining a request. These are our most dependable reviewers, and they have an important effect on the publication decision of every single manuscript they review. During the last five years, we sent 171 review requests to 57 of the signers of the protest

letter.⁷ Only 52.6% could be similarly categorized as "dependable." Most interesting, the younger scholars in the group (assistant and associate professors) were much more cooperative; 70% of them were dependable, the same as our general reviewer base. Among the "leaders" (full professors and holders of endowed chairs), however, only 41.6% were "dependable" reviewers; the rest declined to review once or more (some repeatedly) or did not respond at all.⁸

If the protesters submit relatively few manuscripts to the *Review* (even though there is no evidence that their acceptance rate is lower than for other authors), and the senior faculty and other leaders among them are likelier than others to decline to provide reviews for papers in their specialties, thus delaying the process and potentially exposing the submissions to less sympathetic reviewers, on what basis can it be expected that there should be more of their preferred kind of research in the *Review*?

The APSR has a fair and transparent editorial process that is at least equal to the best of any other scholarly journal. There are four rules that guide Review procedures.

- A necessary condition for publication of an article is that it be submitted. An automatic veto is imposed on all nonsubmitted manuscripts.
- 2. The APSR editor tries hard to communicate in the most efficient way about the journal's policies and strong interest in publishing a wide variety of research, in editor's notes, annual reports, panels and networking at conferences, and invited talks at universities. The APSR does not, however, commission articles, and no potential author should expect a handwritten personal invitation to submit.
- Each manuscript is put through the same rigorous review process as all others and is evaluated by a panel of reviewers who do similar research, i.e., the author's scholarly peers.
- 4. All authors are treated with scrupulous fairness by the editor, and decisions are guided by the reviews. Unfortunately, the odds of rejection are 9 out of 10. Indeed, unless the number of APSR pages is increased, the odds will become even less favorable as the editor succeeds in attracting more papers from a greater variety of scholars. Nevertheless, regardless of the field of research, there is every reason to assume that a persistent author who writes well, can persuade readers of the importance of the problem studied, and does high-quality work using methods appropriate to the research problem, has as good a chance as anyone else of being successful over the long term.

Given that the *Review* is received by all members of the association, any editor will want it not only to publish outstanding research but also to appeal and be useful to as many scholars as possible. Ultimately, however, the editor can only work with manuscripts

Of the 222 individuals who signed the letter, 66 are full professors, 24 are holders of endowed chairs, and 8 hold high administrative appointments in research institutes or other academic organizations.

⁷ The figures exclude manuscripts sent to the one signatory to the letter who is also a member of the APSR Editorial Board

Nevertheless, several signatories to the letter have been extremely cooperative reviewers, reviewing multiple manuscripts without ever declining.

that are submitted. Our goal is to publish the most outstanding of the manuscripts received. The journal's worldwide reputation, the respect it is accorded throughout political science and allied disciplines, and our citation rates all suggest that we succeed to a very great extent. The diversity of the discipline and the specialized reading habits of scholars mean, however, that most will find relatively few articles of special interest in any given issue. This is not a failing of the Review but is in the essential nature of any disciplinewide journal. Political science has room for many different types of research. It does none of us any good to demean the work of others, and least of all should such disparagement come from those who tell us publicly that they do "not even read, much less submit, to the APSR."

The APSR now receives approximately 450 new papers every year and can publish fewer than 50. The editor has no control over the size of the journal. After communication with hundreds of authors over the past five years, and especially with those close to their tenure deadline who want to speed up the review process, no one understands better than I the frustration of many scholars with our very low acceptance rate and the limited range of APSA publications. I have urged an increase in the size of the APSA's publication program in several venues, including meetings of the Publications Committee and the APSA Council (see my "Annual Report," PS 32 [December 1999]: 809-10). Based on the very strong recommendation of the Publications Committee, the APSA Council at its August 2000 meeting passed a resolution to explore ways to increase publication space, and a committee is now working on that issue. Options will include adding pages to the APSR or to PS, or introducing a new journal.9 Until something like that happens, some of the problems addressed by the protestors cannot be fully resolved.

In the long run, the discipline may fractionate by subfield and/or method, and the problems of difficult communication and lack of mutual appreciation for one another's research may be resolved by an agreement to disagree and the formation of additional associations, which has already happened in several subfields. In the short run the solution is not to attack and attempt to delegitimize the one journal common to all APSA members but to increase the journal space available for our growing number of active scholars and to exhort all interested members of the discipline in all subfields to submit early and often.

As always, I will be happy to clarify anything about our submission and review process that remains unclear. Please contact me at apsr@ssc.msu.edu.

It is time once again to thank all the scholars who reviewed for the APSR this past year. The quality of our articles is improved very significantly by their efforts. In "revise and resubmit" decision letters, authors are told to which reviewers I will return and are

invited to write memos that specify changes made in response to these reviewers' comments or that explain their disagreements. Virtually all authors submitting revisions do this. The responses to the revision memos come, of course, in the subsequent reviews. This process frequently encourages a very fruitful dialogue between author and reviewer. Although there is not always a meeting of the minds, this system encourages very serious consideration of suggestions for revision. The depth of the reviews, many of which are multiple pages, and the willingness of reviewers to consider revisions (sometimes more than once) are measures of their commitment to the process.

Approximately 2,000 scholars have reviewed for the APSR over the past five years, making ours one of the largest and broadest reviewer pools of any scholarly journal. The editorial board joins me in expressing gratitude to all of them. The approximately 700 scholars who participated this year are listed at the back of this issue. If anyone we have not yet called upon has an interest in reviewing manuscripts, or knowledge of other scholars who can discern good work in their field of expertise, please let me know. As large as our reviewer pool is, increasing its size and diversity is a constant goal.

Readers will also find the annual index for 2000 at the back of this issue. A comprehensive index of all articles and book reviews published since 1996 can be found at our web site: http://www.ssc.msu.edu/~apsr/cumindex.htm

Authors are reminded that no new submissions will be accepted by this office during August 2001. Invited revisions and reviews may be sent in at any time. Please refer to the June 2001 issue for information about the address change for the editorial office, as well as the dates for sending manuscripts and reviews to the new editorial office.

Ada W. Finifter Editor

INSTRUCTIONS TO CONTRIBUTORS

General Considerations

The American Political Science Review strives to publish scholarly research of exceptional merit, demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the Review reaches a diverse audience of scholars and practitioners, contributors should demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors should strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

Since the *Review* publishes original research, authors should not submit articles containing tables, figures, or substantial amounts of text already published or forthcoming in other places, or that are included in other manuscripts submitted for review, whether to book publishers or periodicals (including online journals), or are otherwise committed. In many such cases, subse-

⁹ These initiatives have been in play for well over a year, and various reports and council actions were posted at the APSA web site long before the 124 sent their letter of protest.

quent publication of this material would violate the copyright of the other publisher. The APSR also does not consider papers currently under review at other journals or that duplicate or overlap with parts of larger manuscripts that have been submitted to other publishers (including publishers of both books and periodicals). Since space is at a premium, submission of articles substantially similar to manuscripts submitted or published elsewhere, or to part of a book or other larger work, is also strongly discouraged. If there is any doubt about whether these policies would apply to a particular case, the author should discuss any such publications related to a submission in a cover letter to the Editor. The Editor should also be notified of any related submissions to other publishers, whether for book or periodical publication, that occur while an article is under review at the APSR and that would fall within the scope of this policy. Copies of related publications may be requested.

For manuscripts containing quantitative evidence and analysis, authors should describe their empirical procedures in sufficient detail to permit reviewers to understand and evaluate what has been done and, in the event the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least, sampling procedures, response rates, and question wordings should be given; authors are encouraged to calculate response rates according to one of the standard formulas given in The American Association for Public Opinion Research, Standard Definitions: Final Dispositions of Case Codes and Outcome Rates for RDD Telephone Surveys and In-Person Househould Surveys (Ann Arbor, MI: AAPOR, 1998). This document is available on the Internet at http://www.aapor.org/ ethics/stddef.html>. For experiments, provide full descriptions of experimental protocols, methods of subject recruitment and selection, information about any payments and debriefing procedures, and other relevant details. It is desirable for articles to be selfcontained, and authors should not refer readers to other publications for descriptions of these basic research procedures.

Please indicate variables included in empirical analyses by capitalizing the first word in the variable name and italicizing the entire variable name the *first* time each is mentioned in the text. Authors should also be consistent in using the same names for variables in text and tables, and avoid overuse of acronyms and computer abbreviations when discussing variables in the text. All variables appearing in tables should have been mentioned in the text and the reason for their inclusion in the analysis discussed.

As part of the review process, authors may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If readers are advised that additional information is available from the author, printed copies of that information should be submitted with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

The APSR uses a double-blind review process. Authors should follow the guidelines for preparing anonymous copies in the "Specific Procedures" section below.

Manuscripts that are largely or entirely critiques or commentaries on previously published articles will be reviewed using the same general procedures as for regular articles with one exception. In addition to the usual number of reviewers, such manuscripts will also be sent to the scholar(s) whose work is being critiqued, in the same anonymous form as they are sent to other reviewers. Comments from the original author(s) to the editor will be invited as a supplement to the advice of regular reviewers. There are several purposes for this notice to the original author(s): (1) to encourage review of the details of analyses or research procedures that might occasionally escape the notice of disinterested reviewers; (2) to enable prompt publication of critiques by supplying critiqued authors with early notice of their existence and, therefore, more adequate time to reply; (3) as a courtesy to critiqued authors. Authors of critiques should therefore send as many additional copies of their manuscripts as will be required for this purpose.

Manuscripts being submitted for publication should be sent to Professor Ada W. Finifter, Editor, American Political Science Review, Department of Political Science, Michigan State University, 303 South Kedzie Hall, East Lansing, MI 48824-1032. Correspondence concerning manuscripts under review may be sent to the same address or, preferably, by e-mail to apsr@ssc.msu.edu. Please note that the APSR does not process new manuscripts during August; new manuscripts should be mailed to arrive either before or after. Invited revisions and reviews may be submitted at any time and will be processed upon arrival.

Manuscript Formatting

Manuscripts must not be longer than 45 pages including text, all tables and figures, notes, references, and appendices. The page size guideline is based on the U.S. standard 8.5 X 11 inch paper and must be adjusted accordingly by authors who are submitting manuscripts printed on longer paper. Font size must be at least 11 point for all parts of the paper. The entire paper must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence, and text should be formatted using a normal single column no wider than 61/2 inches, as is typical for manuscripts (rather than the double-column format of the published version of the Review), and printed on one side of the page only. Include an abstract of no more than 150 words. The American Political Science Review style of embedded citations should be used, and there must be a separate list of references at the end of the article. Please do not use footnotes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission and review purposes, authors are

encouraged to place footnotes at the bottom of the pages instead of using endnotes and may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. Authors of accepted manuscripts are also required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

For specific formatting style of citations and references, please refer to any articles in the most recent issue of the *Review*. For unusual style or formatting issues, authors may consult *The Chicago Manual of Style*, 14th edition. For review purposes, we do not require that citations and references be in specific *APSR* format, although some generally accepted format should be used, and all citation and reference information should be provided.

Specific Procedures

Please follow these specific procedures for submission:

- Submit five copies of manuscripts. Please review all
 pages of all copies to make sure all copies contain all
 tables, figures, appendices, and bibliography mentioned in the manuscript and that all pages are legible.
- To comply with the Review's policy of doubleblind peer reviews, only one of the five copies submitted should be fully identified as to authorship and four should be in anonymous format.
- 3. For anonymous copies, if it is important to the development of the paper that an author's previous publications be cited, this should be done in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to oneself in the third person and including normal references to the work cited in the list of references. Under no circumstances should an author's prior publications be included in the bibliography in their normal alphabetical location but with the author's name deleted. Assuming that text references to an author's previous work are in third person, full citations should be included as usual in the bibliography. Use of other procedures to render manuscripts anonymous should be discussed with the Editor prior to submission. Authors also should not thank colleagues in notes or elsewhere in the body of the paper or mention institution names, web page addresses, or other potentially identifying information. All acknowledgements must appear on the title page of the identified copy only. Manuscripts that are not judged anonymous will not be reviewed.
- 4. Cover pages: The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. The first page of the identified copy should contain (a) the name, academic rank, institutional affiliation, and

contact information (address, telephone, fax, e-mail) for all authors; (b) in the case of multiple authors, an indication of the author who will receive correspondence; (c) any relevant citations to the author's previous work that have been omitted from the anonymous copies; (d) acknowledgements, including the names of any colleagues who have provided comments to the author on the manuscript. If the identified copy contains any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.

- 5. Please also send a loose copy of the cover page of the identified copy.
- 6. Authors having access to e-mail should send a copy of the abstract to apsr@ssc.msu.edu, when the submission is mailed. The subject line should contain the word Abstract followed by the first listed author's last name. The body of the message should contain the title of the paper, the names of all authors, and the abstract (as on the loose page described above). E-mail submission of the abstract is not required but will help us process your manuscript more efficiently.
- 7. Authors should not fax abstracts, send any part of the paper itself by e-mail, or send the abstract by e-mail before their submission packet is in the mail. No copies of submitted manuscripts can be returned. Since submission procedures may be modified in the future, authors are encouraged to check for current instructions in the most recent issue of the Review or at our Internet web site, http://www.ssc.msu.edu/~apsr/.

ELECTRONIC ACCESS TO THE AMERICAN POLITICAL SCIENCE REVIEW

Full text of the American Political Science Review is available in several electronic formats and through several different venders.

Except for the last three years (as an annually "moving wall"), back issues of the American Political Science Review beginning with Volume 1, Number 1 (November 1906) are available online through JSTOR (http://www.jstor.org/). Issues through Volume 90, Number 4 (December 1996) are currently available. At present, while JSTOR's complete collection is available only via institutional subscription, individual subscriptions to the APSR part of JSTOR are now available to APSA members. Please contact Member Services at APSA for further information.

Full text access to current issues of both the APSR and PS is also available online by library subscription from a number of database vendors. Currently, these include University Microfilms Inc. (UMI) (via its CD-ROMs General Periodicals Online and Social Science Index, and the online database ProQuest Direct), Online Computer Library Center (OCLC) (through its online database First Search as well as on CD-ROMs and magnetic tape), and the Information Access Company (IAC) (through its products Expanded Academic Index, InfoTrac, and several online services [see below]). Others may be added from time to time.

APSR is also available on databases available through six online services: Datastar (Datastar), Business Library (Dow Jones), Cognito (IAC), Encarta Online Library (IAC), IAC Business (Dialog), and Newsearch (Dialog).

The editorial office of the APSR is not involved in the subscription process to either JSTOR for back issues or the other vendors for current issues. Please contact APSA, your reference librarian, or the database vendor, as appropriate, for further information about availability.

BOOK REVIEWS

All book review correspondence should be sent to he Book Review Editor, Professor Mark Lichbach, American Political Science Review Book Review, Department of Political Science, University of California, Riverside, Riverside, CA 92521-0118. E-mail: apsrbook@wizard.ucr.edu. Authors wishing their book to be considered for review should ask their publisher to send a copy to the Book Review Editor. Those interested in reviewing books should send their vita to the Book Review Editor.

OTHER CORRESPONDENCE

The American Political Science Association's address, telephone and fax are: 1527 New Hampshire Avenue, NW, Washington, D.C. 20036, (202)483-2512, and fax (202)483-2657. E-mail: apsa@apsanet.org. Please direct correspondence as follows:

Information, including news and notes, for PS Dr. Robert J-P. Hauck, Editor, PS E-mail: rhauck@apsanet.org

Circulation and subscription correspondence (domestic claims for nonreceipt of issues must be made within four months of the month of publication; overseas claims, eight months)

Elizabeth Weaver Engel,

EXEDITING REQUESTS FOR COPYING APSR AND PS ARTICLES FOR CLASS USE AND OTHER PURPOSES

Class Use

The Comprehensive Publisher Photocopy Agreement between APSA and the Copyright Clearance Center (CCC) permits bookstores and copy centers to receive expedited clearance to copy articles from the APSR and PS in compliance with the Association's policies and applicable fees. The general fee for articles is 75 cents per copy. However, current Association policy levies no fee for the first ten copies of a printed article, whether in course packs or on reserve. Smaller classes that rely

heavily on articles (i.e., upper level undergraduate and graduate classes) can take advantage of this provision, and faculty ordering ten or fewer course packs should bring it to the attention of course pack providers. APSA policy also permits free use of electronic library reserve with no limit on the number of students who can access the electronic reserve. Both large and small classes that rely on these articles can take advantage of this provision. The Copyright Clearance Center's address, telephone, and fax are: 222 Rosewood Drive, Danvers, MA 01923, (978)750-8400, and fax (978)750-4474. This agreement pertains only to the reproduction and distribution of APSA materials as hard copies (e.g., photocopies, microfilm, and microfiche).

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions.

APSA also has a separate agreement pertaining to CCC's Academic E-Reserve Service. This agreement allows electronic access for students and instructors of a designated class at a designated institution for a specified article or set of articles in electronic format. Access is by password for the duration of a class.

Please contact your librarian, CCC, or the APSA Reprints Department for further information.

APSR Authors

Authors of APSR articles may use their own articles in course packs or other printed materials without payment of royalty fees and may post their articles at personal or institutional web sites as long as the APSA copyright notice is included.

Other Uses of APSA-Copyrighted Materials

For any further copyright issues, please contact the APSA Reprints Department.

INDEXING

Articles appearing in the Review before June 1953 were indexed in The Reader's Guide to Periodical Literature. Current issues are indexed in ABC Pol Sci; America, History and Life 1954-; Book Review Index; Current Contents: Social and Behavioral Sciences, EconLit; Energy Information Abstracts; Environmental Abstracts; Historical Abstracts; Index of Economic Articles; Information Service Bulletin; International Index; International Political Science Abstracts, The Journal of Economic Literature; Periodical Abstracts; Public Affairs; Recently Published Articles; Reference Sources; Social Sciences and Humanities Index; Social Sciences Index; Social Work Research and Abstracts; and Writings on American History. Some of these sources may be available in electronic form through local public or educational libraries. Microfilm of the Review, beginning with Volume 1, and the index of the Review through 1969 are available through University Microfilms Inc., 300 North Zeeb Road, Ann Arbor, MI 48106 (www.umi. com). The Cumulative Index to the American Political Science Review, Volumes 63 to 89: 1969-95 is available through the American Political Science Association.

International Peacebuilding: A Theoretical and Quantitative Analysis

MICHAEL W. DOYLE Princeton University NICHOLAS SAMBANIS The World Bank

International peacebuilding can improve the prospects that a civil war will be resolved. Although peacebuilding strategies must be designed to address particular conflicts, broad parameters that fit most conflicts can be identified. Strategies should address the local roots of hostility, the local capacities for change, and the (net) specific degree of international commitment available to assist sustainable peace. One can conceive of these as the three dimensions of a triangle whose area is the "political space"—or effective capacity—for building peace. We test these propositions with an extensive data set of 124 post—World War II civil wars and find that multilateral, United Nations peace operations make a positive difference. UN peacekeeping is positively correlated with democratization processes after civil war, and multilateral enforcement operations are usually successful in ending the violence. Our study provides broad guidelines for designing the appropriate peacebuilding strategy, given the mix of hostility, local capacities, and international capacities.

The collapse of state institutions in Somalia, a coup in Haiti, and civil wars in Bosnia, Cambodia, El Salvador, Guatemala, and other countries have marked the distinctive contours of civil strife in the past decade. The international community's responses to these emergencies have, despite sometimes major efforts, been mixed at best: Occasional successes in restoring a legitimate and effective government are matched by striking failures to do so. The United States and the United Nations intervened in Somalia, but their effort appeared to lack direction. In Cambodia the UN undertook a multidimensional operation that left behind in 1993 a partial peace; there was a coup in 1997, and the country now struggles ahead with a renewed coalition government. In El Salvador, Guatemala, Namibia, Eastern Slavonia (Croatia), and Mozambique peace is firmer, but the long-run prospects of social integration remain problematic. In Bosnia, de facto partition still holds sway in most of the country, and current stability is a direct function of NATO peacekeeping. The international community has assumed temporary sovereignty in Kosovo and East Timor, and the task of developing viable polities there has barely begun.

One of the most important challenges for the international community is how to rebuild stable polities in the aftermath of civil war. How can it help prevent renewed hostility? What role should it play to ensure that failed states do not relapse into chaos as soon as the peacekeepers leave? The UN and various regional

Michael W. Doyle is the Edwards S. Sanford Professor of Politics and International Affairs and director of the Center of International Studies, Princeton University, Princeton, NJ 08544 (mwdoyle@princeton.edu). Nicholas Sambanis is Economist, Development Economics Research Group, The World Bank, Washington, DC 20433 (nsambanis@worldbank.org).

The authors thank Paul Collier, Michael Dark, Avinash Drxit, Ibrahm Elbadawi, Amy Gardner, Jeffrey Herbst, Ioannus Kessides, Jeffrey Lewis, Chris Pauson, Ken Schultz, Peter Singer, Erik Voeten, and participants in a Center of International Studies seminar for comments on an earlier draft of this paper and the Christian A. Johnson Endeavor Foundation, a Hewlett Foundation Fellowship at the Center for Advanced Study in the Behavioral Sciences, and the Mellon Foundation for their support.

organizations, including NATO, have accepted the responsibility for postconflict peacebuilding and have authorized their member states to undertake extensive intrusions into the domestic affairs of legally sovereign states. What guidelines should be developed to help steer these ambitious mandates?

In current usage in the UN and among private voluntary organizations, peacebuilding is an attempt, after a peace has been negotiated or imposed, to address the sources of current hostility and build local capacities for conflict resolution. Stronger state institutions, broader political participation, land reform, a deepening of civil society, and respect for ethnic identities are all seen as ways to improve the prospects for peaceful governance.² In plural societies, conflicts are inevitable. The aim of peacebuilding is to foster the social, economic, and political institutions and attitudes that will prevent these conflicts from turning violent.³ In effect, peacebuilding is the front line of preventive action.

PEACEBUILDING STRATEGIES

The political strategy of a peacebuilding mandate is the concept of operations embodied in its design. Just as civil wars are usually about failures of legitimate state authority, sustainable civil peace relies on its successful reconstruction. Peacebuilding is about what needs to happen in between. Civil wars arise when individuals, groups, and factions discover that a policeman, judge, soldier, or politician no longer speaks and acts for them. The local cop becomes the Croatian, Serb, or

¹ For a discussion of the concept, see Cousens, Kumar, and Wermester 2000; Franck 1998; Goulding 1993. The UN's own views can be found in Annan 1998 and Boutros-Ghali 1992.

² For a discussion of comprehensive peace, see Boulding 1964 and Kacowicz 1994, chap. 1. For a valuable collection of articles on peacebuilding, see Cousens, Kumar, and Wermester 2000; Evans 1993; UN Department for Development Support and Management Services and UN Industrial Development Organization 1995.

³ No peace is perfect. Isaah (11:6) prophesied that we shall know peace when we see the lamb lie down with the lion. Comedian Woody Allen (1976, 28) adds a valuable warning for our world: One of the two might not get much sleep.

Muslim cop. When the disaffected mobilize, acquire the resources needed to risk an armed contest, meet resistance, and judge that they can win, civil war follows.⁴

Although we can imagine purely cooperative solutions to domestic peace,5 the confusion, "noise," violence, and changing identification that characterize the onslaught and conduct of civil war do not seem to be promising circumstances for rational cooperation among factions. Instead, the establishment of civil peace seems to require addressing directly both the defensive and aggressive incentives that motivate faction leaders (and sometimes their followers). Defensive incentives arise in the domestic security dilemma. As anarchy emerges (due to the collapse of central authority), each group/faction seeks to arm itself for protection; as in interstate anarchy, however, each defensive armament constitutes a threat to other factions (Posen 1993). Offensive incentives arise because factions and their leaders want to impose their ideology or culture, reap the spoils of state power, seize the property of rivals, exploit public resources for private gain, or all of the above. Peace thus requires the elimination, management, or control of "spoilers" (Stedman 1997) or war entrepreneurs (DeFigueiredo and Weingast 1999).

Conquest by one faction can solve the problem (but even in this case political and social reconstruction can be vital for longer term legitimacy and stability). Peace through agreement can employ the separation of populations and territorial partition to address war-prone incentives (Kaufmann 1996). Civil wars can be turned into international conflicts, as between Eritrea and Ethiopia, or stable and relatively secure international or intercommunal balances of power, as in Cyprus or Somalia (Herbst 1996/97). To each spoiler, his or her separate pile of spoils. But in many civil wars the contest is over who or what ideology controls a single polity. Moreover, in some ethnic wars the costs of "cleansing" will seem too high, or a common basis for overarching civic citizenship exists or can be created. Combatants in these circumstances still have continuing disputes over material interests, who or what rules, and safety. Each has experienced devastating destruction (although in varying degrees), and both leaders and followers are likely to harbor deep resentment for losses sustained, particularly to family and friends. They also experience the costs of war and may come to a "hurting stalemate," in which no faction sees that it can win and each perceives the high costs of continuing strife (Zartman 1985). In these latter circumstances, sustainable peace needs state authority as a starting point to overcome security concerns. Hobbes's Leviathan—state sovereignty, or authority—fills that role, restoring legitimate power.6

The rational choice theory of civil war is relevant to the calculations parties make to support or reject peace after the fighting ends. Simply put, war will recur if the expected utility of war is greater than the expected utility of peace. Such a model underpins recent work on civil war occurrence and termination (Azam 1995; Collier and Hoeffler 1998, 2000; Hirschleifer 1987; Mason and Fett 1996). These studies assume that the warring parties are rational but not infallible; war generates private and public gains and losses that are unevenly distributed; private gains explain why war may be rational for some groups; and because war is collectively suboptimal, it is also collectively irrational. These assumptions allow analysts to make a series of hypotheses regarding the likelihood of war, but the results of such a decision-making model clearly depend heavily on a further set of detailed assumptions.

The specific motivations that shape the behavior of combatants are thus complex and varied. The Thucydidean and Hobbesian trinity of motives (fear, honor, interest) are present in modern variations—security dilemmas, ethnic identity and/or ideological fervor, and loot seeking—and each of them is complicated by potential differences between leaders and followers and factions and patrons. The decision to organize or participate in a rebellion and then attempt to achieve a viable peace is not a straightforward matter and may differ greatly across actors. What each shares, however, is a political environment in which success in achieving peace depends on the degree of harm sustained, the resources available for development, and the international assistance to overcome gaps. Low levels of economic development and other deficiencies in local capacities may motivate actors to violence, due to the low opportunity cost of war and the opportunities for private gains from violence (Collier and Hoeffler 2000). Increased hostility due to the experience of war makes reconciliation more difficult. To achieve peace and reconciliation under these circumstances, Zartman (1995) argues that we need to (1) reconcentrate central power (the powerful must be recognized as legitimate; or the legitimate made powerful), (2) increase state legitimacy through participation (elections, power sharing), and (3) raise and allocate economic resources in support of peace. To this he adds that, given the devastation of civil war, all three generally require (4)

⁴ The literature is extensive. We have especially benefited from David 1997; DeNardo 1985, Eckstein 1964, Gurr 1993, Lake and Rothchild 1996.

⁵ See, for example, Fearon and Laitin 1996, but note that the authors do not claim to explain the empirical record of domestic peace. They acknowledge (p. 731) that state power and domestic authority are alternative explanations.

⁶ The Oxford English Dictionary defines authority: "right to command," "power to influence action," "power over the opmions of others." An enlightening essay is "What Is Authority" (Arendt 1961), and an mughtful treatment of the Hobbeauan problem applied to economic development is the concept of the "stationary bandit" (Olson 1993).

⁷ A decision-making model of peacebuilding failure would require limiting assumptions about the interaction among rebel groups and between them and the government as well as about the rebels' motivation, their relative size, and their strength, by estimating either a Cournot-Nash equilibrium (Collier and Hoeffler 2000) or Stackelberg (leadership) equilibrium (Azam 1995). The parties' decision to support peace or return to war could then be derived by maximizing their utility functions with respect to each other's expected reaction functions.

external, international assistance or authority in a transitional period.8

This last dimension is our particular focus here. We do not intend to model a specific decision-making framework nor to predict where the UN will choose to become involved; rather we will explore the correlates of successful and unsuccessful peacebuilding after civil war. What role does international assistance play in the peace process? How much and of what kind is required? We will argue that the levels of war-related hostility and the pre- and postwar levels of local capacities interact with present international capacities to deliver specific postconflict outcomes. For given levels of local capacity and hostility, we will identify the right form of international assistance to maximize the available space for peace.

A PEACEBUILDING TRIANGLE

International peacebuilding strategies—concepts of operations—should be "strategic" in the ordinary sense of that term, matching means to ends. Although the strategy must be designed to address a particular situation, broad parameters that fit most conflicts can be identified. All strategies should address the local sources of hostility, the local capacities for change, and the (net) specific degree of international commitment available to assist change. One can conceive of these as the three dimensions of a triangle whose area is the "political space," or effective capacity, for building peace. This suggests that the dimensions substitute for one another, that is, more of one substitutes for less of another; less extreme hostilities substitute for weak local capacity or minor international commitment.

International commitment (or lack thereof) interacts with local capacities and factional hostility to shape the triangular space; few peacebuilding plans work unless regional neighbors and other significant international actors desist from supporting war and begin supporting peace. The end of Cold War competition was an important precondition for the bloom of peacebuilding operations in the early 1990s. Beyond that minimum, international peacebuilding, from monitoring to enforcement, also makes a difference. We divide international peacebuilding into four types of mandated operations.

First, a monitoring or observer mission is an interim arrangement used in violent conflicts with the consent of the host government. In these conflicts, there is no formal determination of aggression. The purpose is to monitor a truce and help negotiate a peace through the presence of military and civilian observers.

⁸ Not every country would benefit from external mediation or mtervention in its civil war. Some wars, we could argue with hindsight, are more likely to promote stable and just government if they are fought to a conclusion and the just side wins. Such an argument might be made for the U.S. Crvil War.

Second, traditional peacekeeping involves the deployment of military units and civilian officials in order to facilitate the negotiated settlement of a conflict. It is based on the consent of the parties (normally authorized under Chapter VI of the UN Charter). Traditional peacekeeping operations (PKOs) typically establish and police a buffer zone and assist the demobilization and disarmament of military forces.

Third, multidimensional peacekeeping is also consent based and is designed to implement a comprehensive negotiated peace agreement. It includes a mix of strategies to build a self-sustaining peace, ranging from those of traditional PKOs to more multidimensional strategies for capacity expansion (e.g., economic reconstruction) and institutional transformation (e.g., reform of the police, army, and judicial system; elections; civil society rebuilding).

Fourth, peace enforcement is a (usually multilateral) military intervention, authorized under Chapter VII of the UN Charter. It is designed to impose public order by force, if needed, with or without host government consent.

International peacebuilding mandates must take into account the characteristics of the factions. Peacebuilding operates not upon stable states but upon unstable factions. These factions (to simplify) come in varying numbers and in various dimensions of hostility based upon how much damage each has done to the other. The more hostile and numerous the factions, the more difficult is the peace process, and the more international assistance/authority is needed to establish peace.

In less hostile circumstances (few factions, a hurting stalemate, or less harm done) international monitoring may be sufficient to establish transparent trust and self-enforcing peace. Monitoring helps create transparency among partners who lack trust but have compatible incentives favoring peace. Traditional peacekeeping assistance also can reduce tradeoffs (e.g., help fund and certify the cantonment, demobilization, and reintegration of former combatants). In these circumstances—few players, substantially compatible incentives, some reconciliation, less damage—international coordination and assistance may be sufficient to overcome hostility and solve implementation problems. An international presence itself can deter defections from the peace treaty, due to the possible costs of violating international agreements and triggering further external involvement in domestic conflict.

In more hostile circumstances, international enforcement can help solve commitment and cooperation problems by imposing order or by directly implementing peace agreements or raising the costs of defection from them. Long-term trusteeship may be required to overcome deep distrust and powerful incentives to defect from the peace. As in prisoner's dilemma and mixed motive games (Axelrod and Keohane 1985; Oye 1985), deep hostility, multiple factions, or lack of coherent leadership may complicate the achievement of self-enforcing cooperation. Conscious direction by an impartial agent to guarantee the functions of effective sovereignty become necessary, and includes such activities as demobilizing the armies of the factions,

⁹ In Cambodia, for example, it was quite important for the prospects of peace that, together, China cease military support for the Khmer Rouge, the Soviet Union and Vietnam for Hun Sen's regime, and the West for the royalist forces. Lacking external support, each faction found negotiations for peace more attractive.

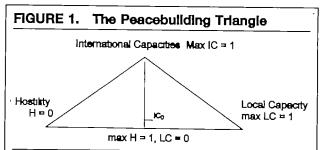

arresting war criminals, and policing and administering a collapsed state.

War-torn countries also vary in economic and social capacity. Some start out with considerable economic development (the former Yugoslavia) and a high level of social capacity in an educated population. Others begin poor and are further impoverished by war (Angola, Sudan, Cambodia). In both cases reconstruction is vital; the greater the social and economic devastation, the larger the multidimensional international role must be, whether consent-based multidimensional peacekeeping or nonconsent enforcement followed by and including multidimensional peacekeeping. International economic relief and productive jobs are the first signs of peace that can persuade rival factions to disarm and take a chance on peaceful politics. Institutions need to be rebuilt, including a unified army and police force and the even more challenging development of a school system that can assist the reconciliation of future generations.¹⁰

In sum, there should be a relation between the depth of hostility, the number and character of the factions, and the level of economic development, on the one hand, and the extent of international assistance and effective authority, whether monitoring or enforcement, needed to build peace, on the other. In a world in which each dimension is finite, we can expect, first, that compromises will be necessary to achieve peace-building success and, second, that the international role will be significant in general and successful when it is designed to fit the case.

Research Design

We will argue that the probability of successful peacebuilding is a function of a country's capacities, the available international assistance, and the depth of war-related hostility. The relations among these are complicated. The availability and prospect of international assistance and extensive local capacities, for example, can both raise the gains from victory (spoils of war and rebuilding assistance) and reduce the costs of fighting (as the assistance serves to sustain the fighting). So, too, deep war-related hostilities can have dual effects. We will argue more specifically that (1) the decision to support peacebuilding (PB) is enhanced by both local and international capacities for peace; (2) net local capacities (NLC) are given by the difference between local capacities (LC) or developmental potential minus war-generated hostility (H); and (3) international capacities (IC) can substitute for deficiencies in local capacities to compensate for the depth of hostility. Thus, we theorize that the PB process is captured by: PB = IC × NLC. That relationship is

Note. The triangle is a metaphor for the peacebuilding space after civil war. Available space is determined by the interaction of the triangle's three eldes: Local Capacities (LC), International Capacities (IC), and Hostility (H) level. The greater local and international capacities and the amailler the hostility level, the greater the space for peace. We assume a strictly positive level of IC, given the support and legitimacy offered sovereign states by international law and norms. This positive level of international support is denoted by the constant lob, which ensures that IC cannot be zero. All three variables, LC, IC, and H, can be measured as indices, ranging from 0 to 1 (maximum). We estimate a model of peacebuilding using these indices as regressors later in the paper.

loosely reflected in the shape of a peacebuilding triangle, as shown in Figure 1.11

This convenient shape makes it possible to visualize our key hypotheses, since the three sets of variables interact competitively (H vs. IC and LC) and cooperatively (LC and IC) to produce a space for peace. ¹² Specifically, this interactive model posits: (1) The larger is IC, the higher is the probability of PB success, given H and LC; (2) the greater (deeper) the hostility, the lower the probability of PB success, given LC and IC; and (3) the larger is LC, the higher is the probability of PB success, given H and IC.

We will test our interactive model by identifying and measuring proxy variables for *Hostility, Local Capacities*, and *International Capacities* and by computing the relative significance of each of these determinants for peacebuilding success. This is the first quantitative analysis of the correlates of successful peacebuilding and of the contribution of UN operations to peacebuilding outcomes.¹³ We map the strategic environment within which actors make their decisions to

¹⁰ We have observed peace operations in El Salvador, Cambodia, Eastern Slavonia (Croatia), Breko (Bosnia), and Cyprus, and it is our opinion that establishing a unified army or multiethnic police force, although difficult, is easy compared to agreeing on an elementary school curriculum.

 $^{^{11}}$ H, LC, and IC are indices ranging from 0 to 1 (maximum). IC = $ic_0 + IC_1$, where IC_1 is the amount of international assistance after the war and ic_0 is a positive constant $(0 < ic_0 < 1)$ that represents the lowest level of international and available ex ante to sovereign states, as provided by international laws ensuring that if LC – H does not equal zero, the probability of peacebuilding success can be defined as the area of the triangle.

¹² Note that we use the triangle to visualize the interaction of the three core variables, and we will be testing that interaction without assuming a functional form for it, as we would, for example, by assuming that the peacebuilding space is only given by the area of the triangle.

¹³ There are many informative and comparative case studies of peacebuilding success and failure. For a valuable critical assessment and bibliography see Collins and Weiss 1997. Among the many works we have found especially helpful are Brown 1996; Chopra 1999; Doyle, Johnstone, and Orr 1997; Durch 1993, 1997; Fetherston 1994; Hampson 1996; Lickhider 1993; Paris 1997; Ratner 1995; and Walter and Snyder 1999 Diehl, Reifschneider, and Hensel 1996 and Haas 1986 analyze the effect of UN missions on conflict recurrence, with a focus on interstate conflicts of varying intensity. A classic piece on interstate conflict is by Haas, Butterworth, and Nye (1972), who argue that the UN works best when elaborate (e.g., multidimensional) peace operations are used.

support peace or war and we explain how best to use UN peace operations to prevent civil wars from recurring.

The Data

To test our hypotheses, we constructed a new crosssectional data set of all civil wars since 1944. We focus on those that ended by 1997, so that we can measure peacebuilding outcomes at least two years after the end of the conflict. A few cases of ongoing wars are included if a peace operation has been initiated, since our interest is in the effectiveness of such operations in ending war and restoring peace. Appendix A provides further discussion of case selection.

We define a civil war as an armed conflict that meets all the following conditions: causes more than 1,000 deaths overall and in at least a single year; challenges the sovereignty of an internationally recognized state; occurs within the recognized boundary of that state; involves the state as a principal combatant; includes rebels with the ability to mount organized armed opposition to the state; and has parties concerned with the prospect of living together in the same political unit after the end of the war. This definition allows us to combine wars from several data sets.

The Explanatory Variables

We selected proxy variables that are theoretically consistent with the interactive model presented above and that forge links with the civil war literature. We proxy the level of hostility by the log of deaths and displacements (LOGDEAD), the type of conflict (WARTYPE), the number of hostile factions (FACTNUM), the level of ethnic division (EH, ELF), and the outcomes of the war (MILOUT, TREATY) (see Appendix B for summary statistics and a list of sources for key variables). We proxy local capacities by a set of socioeconomic measures of development, such as real per capita GDP, energy consumption (DEVELOP), and natural resource dependence (EXP). International capacities are provided by the strength and mandate of peace operations (UNMANDATE, UNOP), if any were used, and by the amount of economic assistance available to the country at war (TRANSFCAP). We control for systemic constraints, such as the Cold War (COLDWAR) or the decade during which the war started (DECADE).

Our main concern is with how international capacities, UN peace operations in particular, influence the probability of peacebuilding success. We collected data on all UN operations and classified them into the four types described above: 15 monitoring or observer mis-

sion (UNOP2), traditional peacekeeping (UNOP3), multidimensional peacekeeping (UNOP4), and peace enforcement (UNOP5).

The Dependent Variable

The main version of our PB dependent variable is PBS2—peacebuilding success or failure two years after the end of the war. We also measure PB outcomes five and ten years after the war (Appendix C explains our coding method). PBS2 is a binary variable, coded 1 for PB success, 0 otherwise. We used a lenient (PBS2L) and a strict (PBS2S3) version of the PB variable (as well as different thresholds for the strict version) to test the robustness of our findings. The lenient version implies an end to the war and to residual lower-level violence and uncontested sovereignty. It represents a minimum (or negative) measure of peace, focused on the absence of violence. There are 71 (57.26%) lenient PB failures and 53 successes (42.74%).

The stricter version of PB also requires a minimum standard of democratization. We prefer this version because it reflects a higher order of peace but requires only a minimum standard of political openness. There are 81 (65.32%) strict PB failures and 43 (34.68%) successes. Table 1 lists all civil war events since 1944 and presents two-year PB outcomes for all these events. 17

TEN POLICY-RELEVANT HYPOTHESES

To achieve easily interpretable results with straightforward policy implications, we interpret our interactive model of PB as a set of associations between PB outcomes and our proxies for hostility, local capacities, and international capacities. We use these proxies to make ten policy-relevant hypotheses.

HYPOTHESIS 1. The probability of peacebuilding (PB) success should be lower in identity wars (i.e., ethnic and religious wars).

Hostility is easily channeled across ethnic lines and several other scholars have identified the ease with which ethnic passions can be mobilized into support for ethnic war (DeFiguereido and Weingast 1999; Lake and Rothschild 1998). Furthermore, the ease of ethnic identification makes it harder to reconcile differences among combatants after civil war (Kaufman 1996).

meduding such regional ones as the NATO operation in Bosnia. We also consider other forms of UN involvement (UNINV) and diplomacy (UNOP1) conducted before attempts at peace implementation.

Briefly, we coded a peacebuilding fallure if the country was at war, if it had large-scale political violence short of war, if it had divided sovereignty, or if it did not meet a minimum standard of political openness according to Gurr's democracy scores (Polity98 project). The data set, information on our coding, sources for all variables, and a discussion of all war events can be downloaded at: http://www.worldbank.org/research/conflict/papers/peacebuilding.

17 We dropped from our analysis wars that ended less than two years before the time of writing (see Appendix A for a full explanation).

¹⁴ Dropping those cases did not change the results presented in later sections. These cases are Angola (1992-ongoing), Burundi (1991-ongoing), Colombia (post-1978), Srl Lanka (Tamil insurrection), and Somalia (after 1992).

¹⁵ We are examining UN cases because they are the predominant form of multilateral peace operation in the entire period, but the conclusions are likely to apply to other multilateral initiatives,

Note: Astensks denote cases that may not have caused 1,000 deaths for every year of the war but have produced 1,000 deaths in at least one year during the war. In total, there are 71 failures and 53 successes of lement peacebuilding and 81 failures and 43 successes of strict peacebuilding. The sources for this table are listed in Appendix A

Hypothesis 2. The probability of PB success should be lower, the greater are the human costs of the war (deaths and displacements). 18

Human costs also proxy the level of war-generated hostility. We measure total deaths—including civilian casualties—and displacements (refugees and internally displaced persons) that result from the war. The greater the human costs, the lower is a society's remaining stock of social and human capital, and the lower its ability to rebound after civil war. Furthermore, the greater these costs, the deeper are the social-psychological barriers to building peace.

HYPOTHESIS 3. Partly in contradiction to the above, the probability of PB success is higher the longer the war. 19

This may seem counterintuitive. It can be argued that longer wars should increase hostility because they create more casualties (other things being equal). Yet, the parties grow tired of fighting, and any prewar uncertainty about the probability of military victory or the parties' relative resolve is removed.²⁰ Longer wars offer a chance for the parties to learn by reflecting on the benefits of peace and by controlling war-related hostility.

HYPOTHESIS 4. The probability of PB success should be lower when the number of factions is larger.

More factions imply a larger pool of potentially divergent preferences, which makes it harder to negotiate a cooperative equilibrium (Oye 1985). As discussed previously, many factions tend to increase the level of hostility. We also hypothesize, however, that the relationship between the number of factions and PB outcomes is nonmonotonic. The initial effect of multiple factions is negative, but at very large numbers, as cross-cutting coalitions emerge, the probability of PB success may rise. An intermediate number should make peace bargaining harder because it is easier to forge cross-cutting coalitions among larger groups of factions than among a polarized few.²¹

HYPOTHESIS 5. The probability of PB success decreases with an increase in ethnic heterogeneity.

Although ethnic groups need not be hostile toward one other, we can assume that each will have different

18 Both absolute and per capita measures should be important. One million casualties is 10% of the population in Cambodia, 0.4% in the United States. But with modern communications and threshold effects, the political/psychological shock of one million casualties in the United States is likely to be much more than 1/25th the effect that this would have in Cambodia.

¹⁹ There is a negative partial correlation between deaths and displacements (LOGDEAD) and PB outcomes and a positive partial correlation between PB outcomes and war duration (WARDUR) This means that our different sign hypotheses about deaths and war duration are meaningful.

20 Blainey (1973) and Fearon (1995) make a similar argument: War occurs at least partially as the result of uncertainty about relative capabilities and resolve.

²¹ This hypothesis reflects similar reasoning in the literature on international systems. Three classics are by Deutsch and Singer (1964), for multipolar stability; Waltz (1964), on bipolar stability; and Selten (1973), for nonmonotonic factors.

preferences about the terms of a settlement or other distributive issues. Finding a mutually acceptable peacebuilding equilibrium should be more difficult when ethnic heterogeneity is great. Collier and Hoeffler (2000), Collier, Hoeffler, and Soderbom (1999), and Elbadawi and Sambanis (2000) show that ethnic polarization significantly increases the risk of civil war, but high levels of both ethnic homogeneity and ethnic heterogeneity reduce that risk. Bates (1999) finds a similar relationship with reference to Africa. We can expect a similar effect in peacebuilding for the same reasons: Ethnically polarized societies should be less able to cooperate in a peace than ethnically homogeneous or very heterogeneous societies.

HYPOTHESIS 6. The probability of PB success is higher, the higher are per-capita income and overall level of economic development.

More developed economies with lower levels of poverty should be both better able to rebuild after war and less susceptible to wars stemming from economic grievance. Many studies show that poverty motivates large-scale violent conflict (e.g., Collier and Hoeffler 2000). Thus, the greater the local capacity, the easier it will be to compensate for war-generated hostility, and the higher is the probability of PB success.

HYPOTHESIS 7. A related hypothesis is that the risk of new war—the probability of PB failure—should be higher in very resource-dependent countries.

Examples of this relationship are the civil wars in Angola, Sierra Leone, and Liberia, where the rebels financed their activities by diamond looting, which itself could have motivated the wars (Collier and Hoeffler 2000). Natural resource dependence further implies an undiversified economy, which is more vulnerable to commodity price shocks and lacks significant manufacturing and service sectors that develop human capital and facilitate economic growth.

HYPOTHESIS 8. The probability of PB success is higher when the war ends with a peace treaty.

Treaties are indicators of relatively low postwar levels of hostility because, at the moment of signing, they typically represent the parties' will to end the violent phase of their conflict. Furthermore, treaties enable international involvement in the form of loans, foreign aid, transfers of goods and services, and the deployment of peace operations. Treaties should be significant factors in peacebuilding, while controlling for related variables.

Hypothesis 9. The probability of PB success is higher if UN peace operations are employed.

UN intervention signals international interest in ending the conflict and offers needed assistance to the parties. Also implied is the transfer of badly needed aid and technical expertise, which can reduce war-related hostility and boost domestic capacities, as outlined in our interactive model.

HYPOTHESIS 10. The probability of PB success is higher, the stronger is the UN peace operation and the more extensive its mandate.

It is important for the UN and other multilateral actors to become involved in a peace process, but the right mandate should be used. We expect monitoring, traditional, and multidimensional PKOs to have a different effect from peace enforcement. All such operations, however, should increase the probability of PB success.

EMPIRICAL FINDINGS AND INTERPRETATION

The hypotheses were tested by estimating logistic models of peacebuilding outcomes with robust standard errors and clustered same-country observations.22 Our models include at least two proxies for each of the three core variables—hostility (H), local capacities (LC), and international capacities (IC).23 We controlled for systemic factors by adding a dummy and interaction variables for Cold War (COLDWAR).24 Since we believe that the Cold War was more relevant in determining violence levels than democratization levels, and since there has been a clear democratization trend over time in most countries, we use the Cold War as a control variable for the lenient (violence-focused) PB model; a variable denoting the Decade in which the War Started (DECADE) is a control variable for the strict (democratization-focused) PB model. Table 2 presents the results of the model, estimated two and five years after the end of the civil war for both strict and lenient PB. We also use two democratization thresholds, low and moderate, to code the strict PB version to test the model's robustness.

Strict Peacebuilding Success (PB\$2\$3)

Our theoretical model is strongly supported by the empirical evidence. In models A-D, international and local capacity and hostility variables are all significant determinants of successful peacebuilding. Local capacities are the least robust, perhaps because they reflect prewar levels, and one would expect wars in different countries to have a differential effect on postwar

development capacity.25 We find that war-related hostility (LOGDEAD) substantially reduces the likelihood of PB success and that greater international capacities increase the probability of PB success. Notice that by signing a treaty and inviting a UN peace operation the parties are several times more likely to achieve peace (see the odds ratios for those two variables). We also find that higher levels of Net Current Transfers per Capita (TRNSFCAP, which includes unilateral transfers, food aid, and so on) substantially increase the probability of PB success, as do higher levels of Economic Development (DEVELOP), whereas that probability is reduced significantly if the country is heavily Resource Dependent (EXP), which suggests a low level of economic development and an undiversified economy. Wars with an ethnic or religious overtone are less likely to be resolved, as are wars with a large number of factions (more on the nonmonotonic effect of factions later). Finally, these relationships become stronger when our definition of peace is stricter (compare models A and B to C and D). For strict PB, local capacities are more significant, and longer wars support the PB process (model D). Our control variable suggests that strict PB has become less likely over time (since the coefficient of decade is negative).

Lenlent Peacebuilding Success (PBS2L)

Our model is slightly less accurate with respect to lenient PB. Whereas models A-D correctly predict on average 85% of the cases in our data set, models E-F correctly predict 80% of cases. LC variables are now not significantly correlated with PB, and only resource dependence continues to have a significant and negative effect among LC variables (one-tailed test). Treaties are also less significant (the odds ratio drops by about half), although hostility variables (deaths, displacements, war type, and number of factions) become much more significant (the odds ratios double in some cases). International capacities are still important, but net current transfers (TRNSFCAP) become more significant, and peace operations become marginally significant. War Duration (WARDUR) is not significant in ending violence, which seems to contradict the warweariness hypothesis (although this effect is also driven by a few outliers; see below). The Cold War is highly significant in the very short run, increasing the likelihood of lenient peace more than fourfold, which suggests that systemic constraints were important in preventing war/violence.

The results for both the strict and lenient model are broadly consistent in the two- and five-year periods, which strengthens our confidence in the model.²⁶ We

²² Clustering allows us to relax the assumption of independence among same-country observations. We continue to assume independence among civil wars that took place in different countries.

²³ For LC variables, we use natural resource dependence (EXP) and economic development (DEVELOP) as proxies, and economic development we proxy by electricity consumption per capita. These data are often not available before 1960, so we have input missing values from other variables that are theoretically and empirically correlated with the LC variable in question. For example, we input missing observations of electricity consumption from data on 1960 GDP per capita, so we do not use GDP in the same regression with electricity consumption per capita.

²⁴ We created interaction terms between the Cold War and UN operation type (UNOPS), economic development, and identity wars, but they were not significant. We report only the results of models in which the Cold War is entered independently.

²⁵ We used prewar measures of LC variables to avoid endogeneity (reverse-causality) problems and to forge a link with the literature, which has identified several LC variables (e.g., economic development levels) as significant deterrents to civil war initiation. We would expect that relationship to hold for the postwar period also, and to apply to peacebuilding processes.

We tested the robustness of our results to different subsamples of the data by dropping the following: highly internationalized cases of civil war; cases that we coded as PB fallures due to divided

anticipate some outliers, given the idiosyncratic nature of many wars, so our classification success of 80–85% is satisfactory.²⁷ Perhaps more important, the model wrongly predicts a PB success for an actual PB failure only 7% of the time (i.e., the model errs on the side of caution), and robustness and diagnostic tests convinced us that the models are well-specified and robust.²⁸

Our main interest is to explain how successful, democratizing PB can be achieved, especially as a result of international efforts. Therefore, we focused closely on model A (strict PB for the short term). Sensitivity analysis as the result of small specification changes is reported in Table 3 (where we give odds ratios and z-values). We do not focus on classification success in Table 3; rather, we test the effect of specification changes on the coefficients and standard errors of key variables. Tables 2 and 3 provide a test of the ten hypotheses.

Policy Hypotheses Tests

In what follows, we mainly discuss the short-term (two-year) strict PB model, and we refer to the lenient model's results, ending the war, only if they differ significantly from the strict model, which also includes promoting democratization.

Hypothesis 1: Accept. Identity Wars (WARTYPE = 1) are highly significant and negatively correlated with peacebuilding success for both the lenient and strict PB models. This is an extremely robust variable across all specifications of the model, but its odds ratio is quite small. In model A, Table 2, and models A1-A8, Table

sovereignty; cases that may be ambiguous (due to the paucity of available data); and all monarchies, since our strict PB variable may be biased against such political systems. The results were generally year robust

The two observations with the largest Pearson's residuals are Pakistan 1 (Bangladesh's war of independence) and Philippines 2 (Moro National Liberation Front). These are also the two most influential cases (in terms of change in deviance) in reducing the model's classification success. When we dropped these two extreme outliers, all explanatory variables were highly significant (at the .05-.01 level), and the model's classification success improved. Other statistically influential cases are the Rwandan war (1990-94), Sri Lanka's ongoing war with the Liberation Tigers of Tamil Belam (LTTE), the Ethiopian-Entrean war (1974-91), Angola's war (1975-91), and the China-Tarwan war (1947).

These tests include: Pearson's chi-square goodness-of-fit; specification link tests for each of the two single-equation models; classification tables with percentages of correctly classified observed positive and negative outcomes; receiver operating characteristics (ROC) curves; the Hosmer-Lemeshow influence statistic, deviance statistics; Pearson's residuals' and graphs identifying outliers and their relative influence on the predicted probabilities. A technical discussion of these tests can be found in Stata 1999.

International peacebuilding is time-sensitive in many ways. Most countries and organizations have tight deadlines and limited horizons when extending military and economic aid to war-torn states. After two to five years, moreover, accidents (hurricanes, droughts) and other factors that have little to do with either the success or failure of peacebuilding strategies enter into the determinants of the stability of a country. Thus, we focus on the short term. In the longer term, at 10 years out, our model loses much of its predictive capacity and most key variables become nonsignificant; the number of cases in our data set also drops to about half the number in our two- and five-year models

3, the odds ratio for war type never rises above .2, which suggests that the influence of this variable is consistently negative, but its overall effect on the probability of PB success is relatively small. Thus, although identity wars have a lower probability of successful PB than nonidentity wars, that difference is not very large. For lenient PB (models E–F), the odds ratio of identity wars is slightly larger, but it is still small relative to other variables. This small increase in the odds ratio suggests that war type is more relevant to ending the violence than to the process of political reform during peacebuilding.

Hypothesis 2: Accept. Human misery created by the war is consistently and negatively associated with PB success, both lenient and strict. This result holds with respect to both the absolute level of Deaths and Displacements (LOGDEAD in all models of Table 2) and for Per Capita Death and Displacements (DEAD-CAP, model A2, Table 3). The odds ratio of deaths and displacements is considerable, and it is larger for the lenient than for the strict version of PB. We find consistent evidence that hostility variables are more significant for ending the violence than for democratization once the conflict is over.³⁰

Hypothesis 3: Accept with Reservations. War duration (WARDUR) is positively correlated to PB success in both lenient and strict models (Table 2), but it is only significant for strict PB. If we drop the two largest outliers, however, WARDUR is highly significant at the 0.001 level.31 We find war duration is not robust to different specifications of the model (see Table 3) due to its correlation with hostility and local capacity variables.32 If we were to drop the deaths and displacements variable, war duration would lose all significance. It is more significant for strict PB with higher democracy thresholds (models C and D, Table 2), which suggests that war weariness may influence the political reform process rather than the decision to stop fighting. Finally, if our observations are clustered by broad geographical region rather than by country (since regional influences are important in peace pro-

³⁰ Walter (1997), who conducted Pearson correlation tests between negotiated settlements in civil wars and different measures of war intensity, including duration and magnitude (deaths per capita) of the conflict, found that these two are both positively associated with negotiation. Our findings are not comparable, since we have added cases and focus on what happens after the war rather than on negotiation. We also use fully specified regression models as opposed to partial correlations.

³¹ Moreover, duration could be endogenous if the previous conflict, or at least its length and intensity, is caused by some failure of the major powers or the international community, which may want to rebuild their reputation. To do this they must "signal to excess," that is, act with such force that no one lacking the full resolve for the future would go that far. (Avinash Dixit points out to us that this phenomenon is neatly illustrated in George V. Higgins's crime novel about the Boston mafia, Cogan's Trade)

²² As we anticipated, war duration is positively correlated with deaths and displacements and with development levels. Its partial correlation with war duration and per-capita deaths (DEADCAP) is 50% higher than its correlation with deaths (LOGDEAD), which makes war duration lose significance in model A2 (Table 3), where we control for DEADCAP. Regan (2000) also finds that civil war duration is greater in more intense wars.

cesses), we find that war duration is significant at the 0.05 level in the core specification of model A of Table 2 (results available from the authors).

Hypothesis 4: Accept. Number of Factions (FACTNUM) is significant and negatively associated with PB success, both strict and lenient (Table 2). The quadratic term (FACTNUM2) is positively associated with PB success, as theorized, but it is only significant for strict PB, for the lower democracy threshold. Thus, we can accept the theorized nonmonotonic relationship between number of factions and PB only for the strict version of PB and only for low levels of democratization. Beyond that, the number of factions has a strictly negative influence on PB.³³

Hypothesis 5: Reject. Ethnic Heterogeneity (EH) is not significantly correlated with PB success (model A1, Table 3). Its mean value is only slightly lower (less than 4 percentage points) in PB successes than in failures (both strict and lenient). More important, the coefficient of EH is positive, which contradicts our hypothesis (although the coefficient changes sign if we drop other variables from the model). We also used an index of Ethnolinguistic Fractionalization (ELF), which is common in the literature (e.g., Mauro 1995) and which measures the probability that any two randomly selected people from different ethnic groups speak a different language. This variable also was not significant (results available from the authors). In addition, we entered ethnic heterogeneity as a quadratic, following some of the literature on civil wars (Elbadawi and Sambanis 2000), but again we found no significance. Furthermore, dropping identity wars and number of factions from the model did not improve the significance of the EH variable.

This is an important result, because several authors have identified ethnolinguistic fractionalization as a key variable in the economic literature on the onset and duration of civil wars (Collier and Hoeffler 2000; Collier, Hoeffler, and Soderbom 1999) and in the literature on economic growth (Alesina, Easterly, and Baquir 1997; Easterly and Levine 1997; Mauro 1995). Our finding could be due to a selection effect, especially if ethnic diversity is a significant determinant of the initiation of civil wars. Yet, Collier and Hoeffler (2000) find that linguistic and religious diversity actually reduces the risk of civil war, which does not suggest that our results are due to selection problems. We are inclined to interpret the difference between the importance of ethnicity for war duration as opposed to peacebuilding as evidence that religious or ethnic wars are difficult to settle, but the mere presence of ethnic diversity does not mean that populations will resume the fight.

Hypothesis 6: Accept Strict PB; Reject Lenient PB. The overall level of economic development (DEVELOP) as

proxied by per-capita consumption of electricity is positively correlated with PB success in both lenient and strict models (Table 2). It is weakly significant for strict PB with a one-tailed test (model A) but not for lenient PB (models E, F). We must reject our hypothesis for the lenient model: Positive local capacities seem consistently irrelevant for lenient PB, that is, for ending the violence. Yet, local capacities facilitate strict peacebuilding (compare the coefficients and significance levels of economic development in models C and D, where we used a higher threshold of democratization for coding a PB success). Finally, clustering observations by geographical region reveals that economic development is significant at the 0.05 level in the core specification of model A of Table 2 (results available from the authors).

Hypothesis 7: Accept. Natural Resource Dependence, proxied by the share of primary exports in GDP (EXP), is significantly and negatively associated with PB success, both lenient and strict (one-tailed test). This finding effectively links our research to the economic literature on the causes of civil wars, which identifies natural resource dependence as a main culprit in loot-seeking civil wars (Collier and Hoeffler 2000). Easily looted resources provide incentives for new wars, which would reduce the probability of PB success. Our finding is relatively robust to different specifications of the strict PB model.

Hypothesis 8: Accept. The hypothesis that treaties are positively correlated with PB success is resoundingly accepted for both the lenient and strict PB models (Table 2). It is notable that other war outcomes are not significant determinants of peacebuilding. For example, Military Victory (MILOUT in model A3, Table 3) is completely nonsignificant, and this finding does not change if we discriminate between government and rebel victory (the latter results are available from the authors). Informal truces are not significantly associated with strict PB, and they have a negative sign.

Hypothesis 9: Accept Strict; Reject Lenient. UN Involvement (UNINV), without specifying the operation's mandate, is positively and significantly correlated with strict PB (model A4, Table 3), but it is not significant for lenient PB.34 Note that there is a high positive correlation between UN involvement and Treaty (TREATY) (38%), since treaties are necessary for many UN PKOs. When we drop treaty from the lenient model, UN involvement becomes significant at the 5% level. It seems that treaties do the heavy lifting, however, and we must acknowledge that simple UN involvement is not enough to strengthen a peaceful transition. The operation's mandate is critical.

Hypothesis 10: Accept. UN peace operations classified according to mandate are highly significant determinants of PB, but this relationship is quite complex.

³³ In the lement model the quadratic term for number of factions (FACTNUM2) loses significance when we control for deaths (LOG-DEAD). Both are proxies for hostility, and they are positively correlated (28%), which may explain the low significance level for FACTNUM2.

^{**} Results are not reported to save space. The coefficient of UN involvement (UNINV) becomes 375, with standard error = 521.

Note: Reported are coefficients (robust coefficient standard errors) and odds ratios in that order. $^*p = .05$, $^{**}p = .01$; two-tailed tests. The possible range for the indices is from 0 to 1. Variables are entered in the indices linearly, independently, and without weights. Our results are robust to several different constructions of all indices. We include treaty in the IC index because it is highly correlated with UN operations, and in many cases treatise were eighted as a result of external involvement. The large difference in the odds ratios of the indices is due to the differences in the actual ranges of each index. Soaling each index by its variance and receitmating the model would adjust the odds ratios. For example, with the scaled indices as regressors, the two-year strict peacebuilding model produces odds ratios for the hostlity, local capsorties, and international capacities indices of .8753, 1.087, and 1.095, respectively

Notice that *UN Mandate* (UNMANDATE) is positively and significantly correlated with strict and lenient PB (Table 2), but the coefficient drops by about half in the lenient version (models E and F). What does this suggest? It is not possible to identify the influence of specific operation types unless we unpack it into its components. We did this and focused specifically on *Observer Missions* in model A5, enforcement in model A6, traditional peacekeeping in model A7, and multidimensional PKOs in model A8 of Table 3.

Diplomatic efforts, UN Mediation (UNOP1), alone is an insufficient strategy. The coefficient is not significant and is negative (not presented). But an observer mission (UNOP2) sent to monitor a truce or treaty does make a positive, although not large or significant, difference. These operations offer additional transparency but no commitment of resources (military and economic) to influence the incentives of the parties to resolve a violent conflict.

Model A6 replaces the previous UN variables with a dummy variable for *UN Enforcement* (UNOP5). It is positively associated with strict PB success but is not significant (the same is true for the five-year version of the PB variable). Thus, the international community cannot count on enforcement alone to build lasting peace,³⁵ but it appears to have a positive role in ending violent conflict.

Models A7 and A8 reveal perhaps the most interesting results with respect to UN operations. Traditional

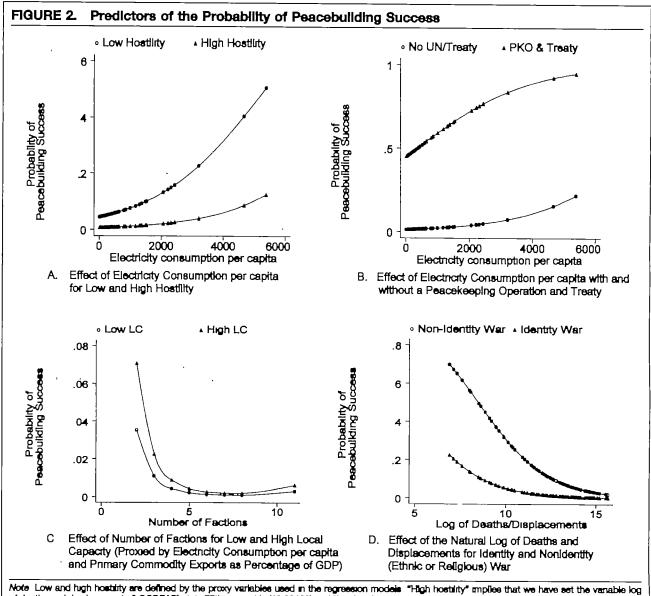

Peacekeeping (UNOP3) is not at all significant in enhancing the prospects for PB success, and it even has a negative sign in the lenient version (results available from the authors). In that case, one observes the syndrome of "peacekeeping without a peace to keep." By contrast, Multidimensional PKOs (UNOP4)—missions with extensive civilian functions, including economic reconstruction, institutional reform, and election oversight—are extremely significant and positively associated with strict PB, a participatory peace. (Notice the high odds ratio of multidimensional PKOs in model A8, Table 3.)

In sum, UN enforcement can help end a war but alone has little effect on institutionalizing participatory peace (our strict PB). By contrast, multidimensional PKOs seem to contribute both to reduced violence (lenient PB; results available from authors) and crucially, to the strict version of PB, which involves institutional and political reform, elections, and democratization. (For further discussion, see Appendix D.)

Index Models of Peacebuilding Success

Having completed our tests of the policy-relevant hypotheses, we return to the core model, aggregate our proxies for hostility, local capacities, and international capacities to three indices, and use these as regressors in estimating the models of strict and lenient peace-building. (The component variables for each index are listed in Appendix B.) We ran many regressions with several combinations of those indices to ensure that the results were not driven by the construction of the index.

²⁵ If enforcement is followed by more diversified missions, however, the results may be different. We only have four cases of enforcement in our data, so these results should be interpreted with caution.

Note Low and high hostility are defined by the proxy variables used in the regression models. "High hostility" implies that we have set the variable log of deaths and displacements (LOGDEAD) at its 75th percentile (13.83109) and "low hostlity" implies setting the variable at the 25th percentile (10.12683). PKO stands for peacekeeping operation, either traditional or multidimensional (for no UN PKO and no treaty, N = 86, for presence of both, N = 15) "Low local capacities" implies that we have set electricity consumption per capita at the 25th percentile (48 kwh) and primary commodity exports as percentage of GDP at the 75th percentile of leathing capacities" are defined in exactly the opposite manner (75th percentile of electricity consumption is 639.0475 kwh and 25th percentile of primary exports as a percentage of GDP is .0880658). Identity wars are ethnic and retigious wars (N = 79). Nonidentity wars are kleology-driven revolutions, loot-driven wars, or other nonethnio, nonreligious wars (N = 45). In Figure 2C, the numbers of factions

Our findings are summarized in Table 4 for a single combination of indices.

We regressed the indices on the two- and five-year versions of lenient and strict PB. We found all three to be highly significant in all models, and their coefficient signs are those predicted by our PB triangle theory. High levels of international and local capacities compensate for high levels of hostility. In varying the composition of the indices, however, we found more significant combinations for the hostility and international capacities indices than for the local capacities index, especially with reference to the lenient PB model. Thus, the results of the index models are in line with the previous discussion of individual proxies.

COMPARATIVE STATICS AND POLICY ANALYSIS

Armed with these findings, we can use the core model to analyze how the interactions between key explanatory variables influence the probability of PB success using conditional effects plots. The four panels of Figure 2 graph the estimated probability of strict PB success when we set a key variable at either the 75th or the 25th percentile of its range while allowing another key regressor to vary throughout its range. Nonvarying regressors are set at their median level.

Figure 2A maps the probability of PB success across all levels of electricity consumption (kwh) per capita for the 75th and 25th percentile of the range of the log

of deaths and displacements (LOGDEAD), which proxies high and low levels of hostility, respectively. We see clearly that not only is PB success much more likely if hostility is low (contrast the circle-studded with the triangle-studded line), but also the rate of increase in the probability of success rises faster as local capacities rise. Local capacity (economic development, measured by electricity consumption) appears to make a reconciliation easier, especially if the two sides have avoided the worst forms of mutual violence.

Figure 2B maps the probability of PB success across all levels of electricity consumption (kwh) per capita (i.e., variable local capacities) with and without a UN peacekeeping operation (PKO) and treaty. The probability of PB success is remarkably higher if a PKO is used. At high levels of local capacity, the probability of success when there is a treaty and a PKO is near unity. The difference is great also at low levels of local capacity: A treaty and PKO substitute for the lack of local capacity (contrast the two lines at very low levels of electricity consumption per capita). The differential effect of a UN PKO and a peace treaty is maximized at middle levels of local capacity.

Figure 2C maps the probability of PB success by number of factions, and for low and high levels of local capacity. Low local capacity is indicated by the values that define the 25th percentile of the range of electricity consumption (kwh) per capita and the 75th percentile of the range of primary exports as percentage of GDP. High local capacities imply values that define the 75th percentile of electricity consumption (kwh) per capita and the 25th percentile of primary exports as a percentage of GDP. The number of factions has a clearly nonmonotonic (U-shaped) effect on the likelihood of peacebuilding. The probability of success is lowest between five and seven factions. It is highest when the number of factions is small, but overall there is not much interaction between the number of factions and local capacity levels, since the difference between the lowest and highest quartiles in the probability of success is quite small.

Figure 2D maps the probability of PB success by level of the log of deaths and displacements (which is the main measure of hostility) for identity and nonidentity wars. There is a huge difference in the probability of PB success of low levels of hostility (deaths and displacements), and, in general, nonidentity wars are most likely to result in a PB success. Ethnic identity wars are four times harder to resolve at extremely low levels of deaths and displacements, but at extremely high levels of deaths and displacements, both types of war are equally unlikely to result in successful peacebuilding. This suggests that war type is overwhelmed by the hostile effects of very large numbers of deaths and displacements, whatever their source. Cambodia, an ideological war with a nonethnic massacre of more than a million people, and Rwanda, an ethnic identity war with a genocide of more than 500,000, are similarly challenging cases in terms of achieving PB success. This plot emphasizes as well the importance of early intervention, before the parties have done extensive killings and especially in a nonidentity war. That is when the probability of PB success is greatest.

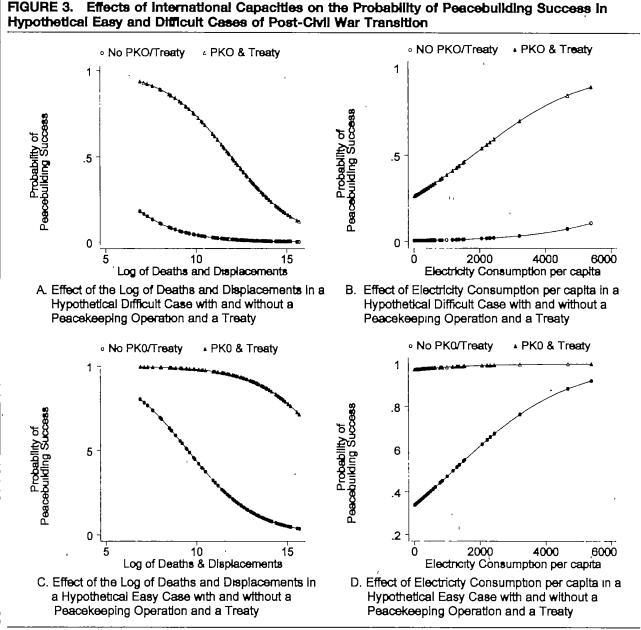

Using model A of Table 2, we can compute the probability of strict PB success for conflicts that have just ended. A perhaps more valuable product of our analysis is that it allows us to assess the contribution of international capacities to the resolution and prevention of future civil war. Using our model, we can identify broad guidelines for PB strategies after civil war, given different levels of local capacities and hostility. Since we focus on the role of UN operations, we draw some broad guidelines for UN involvement using Figure 3.

For simplicity, imagine that peacebuilding processes can be divided into difficult and easy cases. In a hypothetical difficult case, all the variables with a negative coefficient in our model would have high values (we set them at their 75th percentile), and all the variables with positive coefficients would have low values (we set them at their 25th percentile).³⁷ In Figure 3, we create hypothetical difficult and easy cases and explore the effect of international capacities on the probability of peacebuilding success under different combinations of local capacities and hostility levels. Figure 3A and B represent two hypothetical difficult cases, whereas Figure 3C and D represent two easy cases

Figure 3A maps the probability of PB success in a difficult case across all levels of the log of deaths and displacements with and without a UN PKO and peace treaty. This figure represents a hypothetically difficult case because we have set local capacity variables at their 25th percentile. The results are striking: A difficult case without a treaty or PKO, even at the lowest level of hostility (deaths and displacements), has a very low likelihood of PB success, several times lower than with a PKO and a treaty. Peacekeeping does make a positive difference, and early intervention pays. But at very high levels of hostility, after massive civilian slaughter, the two probabilities converge to low levels, although there is still a slightly greater chance of success with a PKO and treaty. For example, a substantial multidimensional PKO made a positive difference in Cambodia, despite the killings and displacements that took place there; an equivalent effort might have been useful in Rwanda.

³⁶ The probability that the religious civil war in Algeria will result in strict peacebuilding success two years after it ends is small (.097), but there is a high standard deviation (.085). Success is even less likely for the Democratic Republic of the Congo (.042). Deploying a PKO in the Congo would increase the probability to an estimated .191, with a standard deviation of .147, that is, the 95% confidence interval for the actual probability would be between 2% and 57%. To obtain these estimates, we used the "Clarify" software (Tomz, Wittenberg, and King 1999).

³⁷ The variables with negative coefficients are WARTYPE, LOGDEAD, FACTNUM, EXP, DECADE. The variables with positive coefficients are UNMANDATE, TRANSFCAP, DEVELOP, WARDUR. Throughout this exercise, we hold WARDUR, FACTNUM, and DECADE constant at their median. Easy cases imply a nonidentity war (WARTYPE = 0), 75th percentile in net transfers per capita (TRANSFCAP) and electricity consumption per capita (DEVELOP), and 25th percentile in primary exports as percentage of GDP (EXP).

Note: To construct easy and difficult cases we use the parameter estimates from model A. For a difficult case, we set regressors with a negative coefficient to the value for the 75th percentile of their range and the regressors with positive coefficients at the value defining the 25th percentile of their range. We do the opposite for an easy case. If we allow local capacity variables to very (e.g., e.g., the log of deaths and deplacementa), then we focus on hostility is high) and easy cases (Figure 3D, where hostility is low) if we allow the hostility variables to very (e.g., the log of deaths and deplacementa), then we focus on capacity variables to create hypothetical difficult cases (Figure 3A, where capacity is low) and easy cases (Figure 3C, where capacity is high). (See note to Figure 2 for definitions of high and low, capacity and hostility.) We keep the following variables at their median: wer duration, number of factions, and decade. This setup allows us to study the effect of International capacities—peacekeeping operations in confunction with a treaty—on the probability of peacebuilding success under different combinations of levels of hostility and local capacity.

These results are almost the mirror opposite of those for an easy case with high local capacities (i.e., electricity consumption at the 75th percentile and natural resource dependence at the 25th percentile) (Figure 3C). Here, the probability of success is quite high at low levels of hostility (deaths and displacements), regardless of whether a PKO is deployed or a treaty signed. The major effect of the treaty and PKO occurs

at high levels of hostility, where they are crucial in maintaining the probability of PB success. Without a treaty and PKO, the likelihood of success drops substantially from an initial value of between 60% and 70% to less than 5% at extreme values of hostility. This appears, for example, to map the situation in Bosnia today, a more developed country that has suffered many casualties and is held together in peace by

NATO, the UN, and a plethora of other international organizations.

Figure 3B maps the probability of PB success for a difficult case across all levels of electricity consumption per capita with and without a UN PKO and peace treaty. This figure represents a hypothetically difficult case because we have set hostility variables at their 75th percentile. We see that a treaty and PKO are even more important for PB success since the slope of the curve with a PKO gets much steeper much sooner than the slope of the curve without a PKO, and the resulting probability of success without a treaty/PKO is minimal even at extremely high levels of economic development.

By contrast, Figure 3D maps the probability of PB success across levels of electricity consumption per capita (i.e., across levels of local capacities) for a hypothetical easy case with and without a UN PKO and peace treaty. This figure represents a hypothetically easy case because we have set hostility variables at the 25th percentile. The effect of a PKO and a treaty is highest at very low levels of development, whereas neither a treaty nor a strong international presence seems necessary for PB success at very high levels of development. Developed countries that experience minor civil violence can put themselves back together. The UN is most needed elsewhere, in the less developed countries that have suffered extensive violence.

CONCLUSION

Our analysis identifies the critical determinants of peacebuilding success. We find that higher order, or democratic, peacebuilding is more successful after nonidentity wars, after long and not very costly wars, in countries with relatively high development levels, and when UN peace operations and substantial financial assistance are available. Lower order peacebuilding—an end to the violence—is more dependent on muscular third-party intervention and on low hostility levels rather than on the breadth of local capacities.

Peacemaking aimed at facilitating a peace treaty is potentially life saving, since we find that treaties are highly correlated with an end to the violence. Moreover, strategically designed peacekeeping and peace enforcement do make a difference. International capacities can foster peace by substituting for limited local capacities and alleviating factors that feed deep hostility. Such intervention improves the prospects for peace, but only if the peace operation is appropriately designed. Enforcement operations can end the violence, but alone they cannot promote durable, democratic peace. By contrast, consent-based peacekeeping with civilian functions (multidimensional PKOs), which ordinarily do not have a mandate to end the violence if parties do not cooperate, usually are not successful in ending violence. With a peace treaty and the cooperation of the parties, however, PKOs can assist with the institutional and political reform that helps secure longer term peace. Truly intractable conflicts, such as those in Bosnia, Kosovo, and East Timor, probably will

require both enforcement and peacebuilding operations, coordinated and in the right order.

APPENDIX A: CODING GUIDELINES FOR CASE SELECTION

The data set consists of the 124 events of civil war since 1944. The analysis is confined to those that terminated before 1997 or were ongoing as of December 1999 but had at least one significant settlement, truce, or third-party peace operation since 1997. This allows an evaluation of peacebuilding outcomes at least two years after either the end of the war or the beginning of a peace operation. Because the latter signals the parties' desire to terminate the war and restore peace at some point, we include these few cases.

Our definition of civil war (see page 783) is nearly identical to that in Singer and Small (1982, 1994) and Licklider (1993, 1995). We define termination as signature of a peace treaty or victory by one side. Our coding of war reflects the 1,000 annual battle deaths standard, although we relaxed that threshold in a few cases, when the overall amount and nature of the violence were substantial (e.g., a state fighting against organized rebel groups who have popular support) and most of our other criteria were satisfied. In fact, the 1,000 deaths criterion seems rather arbitrary, and we could not corroborate that all cases in the Singer and Small (1994) data set reached that annual level during all years of the war. Moreover, the Singer and Small (1994) codebook does not refer to an annual death threshold as a coding condition (it appears in their 1982 book, Resort to Arms), and no annual death data are made available by the Correlates of War Project.

Our definition of a civil war allows us to combine observations from several data sets: Singer and Small (1994); the Uppsala University project on civil wars by Wallensteen and Sollenberg (1997, 1999); Esty et al. (1995, 1998); Licklider (1993, 1995); Mason and Fett (1996); Regan (1996); Walter (1997); and SIPRI yearbooks (1987–98). In addition, secondary texts include case studies and official reports: Doyle, Johnstone, and Orr (1997) on Cambodia and El Salvador, Intrides (1993) on Greece; Rotherg (1998) on Burma; Deng (1999) on the Sudan; Stuart-Fox (1998) on Laos; Human Rights Watch reports on Sierra Leone, Democratic Republic of the Congo, Uganda, Kosovo, Bosnia, and Algeria; and U.S. Department of State reports on Bangladesh, Burma, Cambodia, Chad, Djibouti, Egypt, Guinea-Bissau, Laos, Peru, and the Philippines. Other sources were the CIA World Factbook (various years) and Brogan (1992).

The most important difference between our coding of wars and that by other authors refers to periodization. We tried to apply consistently the following criterion: We code a separate event if war recurs after the parties sign a peace treaty or after a prolonged break in the fighting (at least two years). In some cases this criterion collapses two or more observations in other data sets or, conversely, divides a single observation into two or more war events. For more details on our application of this coding rule, see "Country-Specific Comments" in the online documents (http://www.worldbank.org/research/conflict/papers/peacebuilding).

We adopted this periodization rule because of our focus on peacebuilding efforts. We needed to evaluate the success or failure of every significant attempt at peace, and the criteria for separation suggest that war has subsided, which presents an opportunity for peacebuilding. If a PKO is implemented and the war resumes, that is clear evidence of peacebuilding failure, so we needed to include these cases of ongoing war in the analysis.

Several rules of thumb for coding separate war events also were used. (1) If a different war started while a previous conflict was ongoing in the same country, then we coded separate events (e.g., the Tigrean and Eritrean wars in Ethiopia). (2) If the parties and issues changed dramatically, then we coded a separate event (e.g., the Afghan war before and after Taliban). Also, we collapsed two or more events in

other data sets into one if the parties and issues were the same. (3) If less than two years intervened between the first and second event, then we collapsed observations in other data sets into a single war event. (4) If the war ended officially through an agreement but fighting did not subside, then we considered the war ongoing and coded a single event. Mason and Fett (1996, n. 8) do the same.

APPENDIX C: CODING GUIDELINES FOR THE DEPENDENT VARIABLES

The dependent variables are Lenient Peacebuilding (PBS2L) and Strict PB (PBS253). Three intermediate variables were used in their construction: War End (WAREND), No Residual Violence (NOVIOL), and Democracy (GURR). Each intermediate variable has two versions, one for the two-year period after the war and the other for the five-year period. Each version is represented by a numerical suffix after the computer abbreviation of the variable name. The coding process was done in four steps.

First, did the war end (was there no recurrence)? We coded the variable war end two and five years after the war: WAREND2 and WAREND5. These are coded 1 if the war ended, 0 otherwise. We used the same sources and rules as for coding war events.

Second, did low-level violence end after the war? We coded the variable no residual violence two and five years after the war: NOVIOL2 and NOVIOL5. These are coded 1 if there was no residual violence, 0 otherwise. NOVIOL2 and NOVIOL5 are coded 0 if war recurred (i.e., if WAREND2 or WAREND5 = 0); if other data sets (Esty et al. 1995, 1998; Regan 1996; Wallensteen and Sollenberg 1997) code an ongoing low-level or intermediate armed conflict; or if a politicide or genocide occurred after the end of the war (Gurr and Harff 1997, 1994; Licklider 1995).

Third, what was the level of democratization after the end of the war? We coded the variable democracy (GURR2 and GURR5) from the Polity98 (June 1999) data as the sum of [Democracy + (10 - Autocracy)], two and five years after the end of the war. This variable ranges from 0 (extreme autocracy) to 20 (maximum democracy).

Fourth, the dependent variables were then coded as follows. Lenuent PB Success Two Years after the War (PBS2L) and Lenient PB Success Five Years after the War (PBS5L) are coded 1 if there was a success, 0 otherwise. PBS2L = 1 (success) if WAREND2 = 1 and NOVIOL2 = 1, and if state sovereignty is not divided (i.e., state authority can be exercised in the entire territory). Otherwise, PBS2L = 0. We coded PBS5L in a similar fashion, but we use the two-year period in our analysis because at the time of writing many important wars had not yet been over for five years.

Strict PB Success Two Years after the War (PBS2S) and Strict PB Success Five Years after the War (PBS5S) are coded as follows: PBS2S = 1 if PBS2L = 1 and GURR2 > (a democratization threshold; see below). Otherwise, PBS2S = 0. We coded the five-year version analogously. The strict version of PB involves more than an end to the violence and is our preferred measure of PB success or failure. We created two subcategories of strict PB-a low democracy threshold (GURR = 3), which we prefer because it places fewer demands on the country shortly after the end of the war, and a higher threshold (GURR = 6)—to code variables PBS2S3 and PBS2S6, respectively. We coded the five-year versions analogously (PBS5S3, PBS5S6). For ongoing conflicts, we used democracy data for 1998 because those are the most recent available from the Polity98 project. Finally, we coded a score of -77 ("interregnum") in the Polity98 data set as a PB failure.

APPENDIX D: DOES THE UN PICK ITS FIGHTS? TWO TECHNICAL ISSUES WITH SUBSTANTIVE IMPLICATIONS

Our analysis suggests that the UN can play an important role in peacebuilding, but not all types of UN operations are right for all jobs. We were concerned that some of our findings might be due to selection effects or influenced by the potential endogeneity of UN peace operations, so we briefly examined both these problems. We found that neither alters our findings.

First, let us summarize the concern about potential endogeneity. Given the high degree of correlation between the deployment, mandate, and strength of UN operations and variables that determine PB outcomes, it is possible that the UN's decision to intervene may be determined by some of these other variables. For example, perhaps the UN picks the easy fights. Conversely, perhaps it decides heroically to intervene only in the severest situations. To test that possibility, we estimated two-stage models of peacebuilding, instrumenting for the UN involvement. We do not present the statistical results in detail, since they do not alter our findings.

First, we identified a number of good instruments for UN involvement, such as a dummy variable for Europe (EURO), Real GDP per Capita (GDP), Third Party Partial Intervention (INTERVEN), Non-UN Peace Operation (NONUNOP), and Military Outcome (MILOUT). Second, we then estimated a two-stage least squares (2SLS) linear probability model, a two-stage probit model, and a bivariate probit model with a selection, and we found no evidence of endogeneity for UN involvement. Third, a Smith-Blundell test of exogeneity for the core strict PB model A, using the instruments identified above, yields a chi-squared(1) test = .4118, with p = .521, which does not allow us to reject the null hypothesis of exogeneity (Smith and Blundell 1986).38 That test leads us to reject exogeneity only if we use treaty as an instrument and not as an exogenous variable in the structural equation, which would be incorrect given the significant relationship between treaty and strict PB. Furthermore, even if we were to assume that the UN involvement is in fact endogenous, a linear probability model of strict PB (specified as above and using treaty as an instrument) yields a highly significant coefficient estimate for UN involvement (.497), with a robust standard error equal to .152.39 Given that most of the models estimated reveal no evidence of endogeneity, we can rely on our previous inferences.

A second possible complication arises from the difference in the standard error of UN involvement in the strict versus lenient PB model, which raises concerns about possible selection effects. That discrepancy may have been due to a different effect of UN peace operations on the probability of ending the violence as opposed to the level of democratization following the end of the war. Because a democratization process is observed in our data set only after the war ends, there is a legitimate concern about selection effects. We estimated a Heckman selection model, given in Table D-1, to test whether such selection effects have a significant influence on the efficiency of our previous parameter estimates.

We specified two variations of this model to test the

³⁸ On two-stage probit models, we followed Alvarez and Butterfield 2000; Alvarez and Glascow n.d.; Bollen, Guilky, and Mroz 1950; Guilkey, Mroz, and Thomas 1992; Madalla 1983; and Rivers and Vuong 1988. We used the method suggested by Rivers and Vuong to test for exogeneity by performing a t-test on the residual of the first-stage regression, included as an explanatory variable in the structural model. The residual is the fitted value of UN presence (PredUN) minus the actual value of UN involvement (UNINV). This procedure is used with continuous endogenous variables, so we have to assume that some added level of uncertainty is included in the residual in our case.

⁵⁹ All our analysis and do-files testing the potential endogeneity of UN involvement can be accessed at: http://www.worldbank.org/research/conflict/papers peacebuilding. These regressions are not included here since they do not change our previous results.

799

significance for democratization of peacekeeping as opposed to enforcement operations. Model 1 distinguishes between traditional and multidimensional PKOs, whereas model 2 combines the two. The estimates in model 1 show that multidimensional PKOs are highly significant and positively correlated with the level of democratization observed after the war ends, and they also help end the violence (see the results in the selection equation). By contrast, UN enforcement operations are significant in ending the violence but are nonsignificant and negatively associated with democratization. In model 2, the variable denoting all types of PKOs combined is not strongly significant, especially for ending the violence but also for democracy. The results with respect to enforcement are comparable to model 1. We control for war duration, which is positive and significant, and for the prewar five-year democracy average (GURRLAG5) in our models. We find that a prewar tradition of democratic institutions is the surest correlate of democratization after a civil war.

Model 1 yields a Wald test of independent equations of $\chi^2(1) = 0.92 \text{ (Pr} > \chi^2 = 0.3368)$ and model 2 yields a $\chi^2(1) =$ 1.16 (Pr $> \chi^2 = 0.2816$). These tests do not allow us to reject the null hypothesis of independent equations, which means that the estimates presented in tables 2 and 3 are more efficient and that we can rely on them for our inferences. The Heckman selection models did not cause us to change our estimation methods, but they amplified our earlier arguments regarding the differential effects of PKOs and enforcement operations, and they helped us disentangle the influence of different types of UN operations on democracy.

We can now argue with greater confidence that, the more stable and democratic the peace, the more we need specialized peace operations with a developed civilian component. Furthermore, enhancing local capacities is more important for more democratic peacebuilding, whereas reducing the depth of hostility is more important for less democratic peacebuilding.

Cluster-Based Early Warning Indicators for Political Change in the Contemporary Levant

PHILIP A. SCHRODT and DEBORAH J. GERNER University of Kansas

Event Interaction Survey coded event data generated from Reuters between 1979 and 1998. A new statistical algorithm that uses the correlation between dyadic behaviors at two times identifies clusters of political activity. The transition to a new cluster occurs when a point is closer in distance to subsequent points than to preceding ones. These clusters begin to "stretch" before breaking apart, which serves as an early warning indicator. The clusters correspond well with phases of political behavior identified a priori. A Monte Carlo analysis shows that the clustering and early warning measures are not random; they perform very differently in simulated data sets with similar statistical characteristics. Our study demonstrates that the statistical analysis of newswire reports can yield systematic early warning indicators, and it provides empirical support for the theoretical concept of distinct behavioral phases in political activity.

'n recent years, early warning has emerged as a major concern of national and international agencies that respond to political crises (Boutros-Ghali 1994; Davies and Gurr 1998; Dedring 1994; Esty et al. 1995, 1998; Mizuno 1995; Schmeidl and Adelman 1998) and is a topic of renewed interest in the international relations literature (Gurr and Harff 1994, 1996; Rupesinghe and Kuroda 1992; Schmeidl 1996). The policy community has been inspired by the success of famine forecasting models that have enabled international agencies to reduce fatalities by several orders of magnitude over the past twenty years (Rashid 1998; Whelan 1998). Agencies such as the UN High Commissioner for Refugees and the UN Office for the Coordination of Humanitarian Affairs would like to have comparable models for predicting other catastrophic situations—notably, refugee flows—that require emergency humanitarian response. Academics have contributed to these efforts, as evidenced by the collaboration between operational agencies and university-based researchers in the State Failure Project (Esty et al. 1995, 1998) and the Forum for Early Warning and Emergency Response (http://www.fewer. org); academic scholarship also has been motivated by sobering assessments of the failure of traditional forecasting methods to anticipate the end of the Cold War (Gaddis 1992).

A central focus of event data research has long been the development of tools for the early warning of political change. Much of the initial impetus and, quite critically, early funding for that research came from the U.S. Defense Advanced Research Projects Agency (DARPA). These efforts, including the Early Warning and Monitoring System (EWAMS), were contempora-

neous with the creation of the World Event Interaction Survey (WEIS) and Conflict and Peace Data Bank (COPDAB) event coding frameworks as well as a variety of systematic forecasting techniques (see Andriole and Hopple 1984; Choucri and Robinson 1979; Daly and Andriole 1980; Hopple 1984; Hopple, Andriole, and Freedy 1984; Laurance 1990; Phillips and Rimkunas 1983; Singer and Wallace 1979).

For both institutional and pragmatic reasons, these initial efforts failed to take hold in the policy community (Laurance 1990). By the mid-1980s, interest in and funding for statistical early warning projects had virtually ceased. The policy community continued to spend billions on analytical forecasts by intelligence agencies, but virtually all *political* prediction—as distinct from projecting economic and demographic trends—used traditional rather than statistical techniques.

Because human-coded event data are expensive to generate, the end of policy-oriented event data research meant that new data collection activity declined dramatically, and the academic community was limited to reanalyzing legacy collections that terminated around 1977. The WEIS data set, which was the centerpiece of the DARPA efforts, was maintained through a variety of public and private efforts through the 1980s and 1990s (Tomlinson 1993), but it was not widely available or used. In addition, several small and geographically specific event data sets were created by scholars (e.g., Ashley 1980; van Wyk and Radloff 1993).

Ironically, the emphasis on event-based early warning research ended at a time when two technological changes rendered the approach more feasible. First, the revolution in electronic communications made available a much greater amount of news about political affairs than was used by previous analyses, which usually relied on a small number of elite Western newspapers. By the early 1990s, much of this information was in machine-readable form, initially through such commercial services as NEXIS and Reuters Business Briefing and now through the World Wide Web. Second, the exponential increase in computational power allowed for statistical and coding techniques that were impossible during the earlier period of DARPA research.

Philip A. Schrodt (p-schrodt@ukans.edu) is Professor of Political Science, and Deborah J. Gerner (d-gerner@ukans.edu) is Associate Professor of Political Science, University of Kansas, Lawrence, KS 66045-2157

We received valuable suggestions from Jon Pevehouse, from the "Beer and Politics Seminar" at the University of Kansas, and from the anonymous referees; Rajaa Abu-Jabr provided editorial assistance. This research was funded in part by the National Science Foundation through grant SBR-9410023 and by the University of Kansas General Research Fund grant 3500-X0-0038.

The purpose of this article is to describe several new approaches to early warning that use contemporary technologies and concepts. We begin with a review of the methodological challenges involved in statistical early warning research. We then apply two clustering methods, one based on the distances between points and the other on the changes in the density of the cluster, to an event data set that covers international behavior in the Levant (Egypt, Israel, Jordan, Lebanon, the Palestinians, and Syria) plus the United States and USSR/Russia between April 1979 and December 1998. The Levant has long been regarded as an important example of an international subsystem (Binder 1958; Gause 1999); the relatively large number of actors and varieties of behavior in the region provide for a robust test of any early warning techniques.

Our analyses indicate that events tend to form temporally delineated clusters, and the movement of points in those clusters can be used as an early warning indicator; this finding is consistent with the theories of "crisis phase" that underlie many qualitative approaches to early warning. The clusters we identify generally correspond to demarcations in the time series that we assigned a priori, based on a qualitative assessment of political changes in the region, and differ significantly from clusters found in a set of simulated data with similar statistical characteristics.

STATISTICAL APPROACHES TO EARLY WARNING: A REVIEW

There are some key differences between structural and dynamic models as applied to the early warning problem. We will discuss these and describe the dynamic time-series approach used in our research.

Structural and Dynamic Models

Statistical approaches to early warning can be classified into two broad categories: structural and dynamic.1 The first category includes studies that use events (or more typically, a specific category of events, such as civil or international war) as dependent variables and explain these using a large number of exogenous independent variables. In the domain of domestic instability, this approach is exemplified by the work of Gurr and his associates, most recently in the State Failure Project (SFP; Esty et al. 1995, 1998). Gurr and Harff (1996) and Gurr and Lichbach (1986) describe a number of such research projects. In the field of international instability, the structural approach is illustrated by the work of Bueno de Mesquita and by the Correlates of War project; Gochman and Sabrosky (1990), Midlarsky (2000), and Wayman and Diehl (1994) provide general surveys. Structural approaches have tended to employ multivariate linear regression

models but recently have branched out to other techniques; for example, the SFP uses logistic regression, neural networks, and some elementary time-series methods.

In contrast, dynamic early warning models use event data measures as both the independent and dependent variables. Most projects in the late 1970s employed event-based indicators in dynamic models to predict whether a pair of political actors would become involved in a crisis. For instance, DARPA's EWAMS research evaluated three WEIS-based measures (conflict, tension, and uncertainty) to determine the "alert status" of any dyad. Azar et al. (1977) took a similar approach based on whether behaviors measured with the COPDAB event scale fell outside a range of "normal" interactions for the dyad. More recent efforts have used increasingly advanced econometric timeseries methods that model interval-level indicators of events as an autoregressive time series with disturbances. Goldstein and Freeman (1990) provide a booklength example of this approach; Dixon (1986), Goldstein and Pevehouse (1997), Goldstein et al. (2000), Lebovic (1994), Ward (1982), and Ward and Rajmaira (1992) illustrate the continued development of this type of dynamic model.

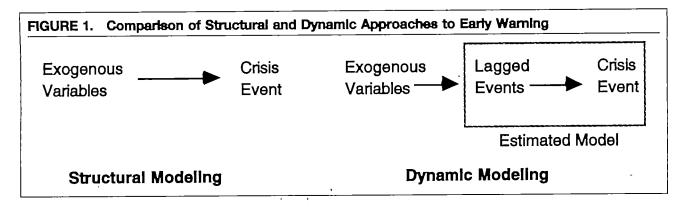

Scholars defend the dynamic approach, which is at odds with most political science statistical modeling in using only lagged endogenous variables, in three ways. According to the first rationale, many of the structural attributes that are theoretically important for determining the likelihood of conflict do not change quickly enough to be used as early warning indicators; in fact, many are virtually static (e.g., ethnic and linguistic heterogeneity, historical frequency of conflict, natural resource base). Data on variables that do change, such as unemployment rates and economic and population growth rates, are often reported only on an annual basis, and the quality of these reports tends to be low in areas under political stress.

The second argument for the dynamic approach is that it allows for greater parsimony in the specification of the forecasting models than a structural approach. The first phase of SFP, for example, collected data on 75 independent variables (Esty et al. 1995, 9), but the final models found that most of the forecasting power resided in only three variables: infant mortality, trade openness, and democracy (Esty et al. 1998, viii). In contrast, the event data collections used in dynamic models allow the researcher to monitor political interactions as reported in public media sources. The focus on events leads to models that contain a relatively small number of independent variables, and the reliance on news sources permits the data to be collected systematically in real time.

Finally, a dynamic modeling approach assumes that the exogenous variables incorporated in the structural models do not need to be explicitly included because their effects will be reflected in the pattern of events preceding a major change in the political system. In

¹ We will not consider the large literature on nonstatistical or qualitative approaches to forecasting, contemporary surveys of which can be found in Davies and Gurr 1998, Rupesinghe and Kuroda 1992, and Schmeidl and Adelman (1998) We also will not deal with long-range forecasting using computer simulation; Ward (1985) and Hughes (1999) summarize that literature.

² Phase II of the SFP involves some limited analysis of dynamic variables and suggests expanding this approach in future studies.

other words, the dynamic approach uses the lagged values of actual events as a substitute for structural variables, as illustrated in Figure 1.

To take a concrete illustration, Gurr (1995, 7) notes that "ethnic heterogeneity probably is most significant for state failure when it coincides with lack of democracy and low regime durability." Consequently, the SFP includes measures for those three variables: ethnolinguistic diversity, regime democracy, and regime durability. A dynamic approach, in contrast, does not measure these aspects of a political system directly; instead, it assumes that each is reflected in the types of events picked up by the international news media. The presence of democracy, for instance, appears not only. in periodic reports of elections but also in a large number of reports discussing disagreements between the government and the elected opposition. A low level of regime durability results in coups and attempted coups. To the extent that ethnicity is an important political factor, there will be ethnically oriented political rallies, outbreaks of violent ethnic conflict, and similar events. A suitably designed event coding scheme should detect the presence or absence of these events and make the appropriate forecast without directly measuring the underlying variables.

At a theoretical level, therefore, dynamic modelers accept the importance of exogenous structural indicators. Ceteris paribus, countries with a high level of ethnic heterogeneity will have a greater propensity for conflict than those with a low level, democracies are likely to be different from autocracies, and so forth. The distinction between the two early warning strategies is one of measurement. Structural modeling seeks to identify and measure the indicators directly, whereas the dynamic approach assumes the effects of structural attributes are indirectly incorporated through the patterns of events they generate.

This is an optimistic but not wholly implausible assumption. For instance, in the Reuters-based domestic data with which we have been working, there is a clear contrast between Israel and Syria with respect to the présence of a democratic opposition. Similarly, ethnoreligious conflict in Lebanon is one of the most conspicuous features of the data set and is in sharp contrast to the relative lack of salience of such conflict in Jordan. Our argument is that an increase in democratization in Syria or a decline in ethnoreligious tensions in Lebanon will be reflected in the political events

reported in Reuters, although we have not analyzed this systematically.

An econometric analogy to the distinction between structural and dynamic political early warning is found in the differences between "technical" and "fundamental" approaches to the analysis of stock prices. A fundamental analysis attempts to predict price changes on the basis of underlying factors, such as marketing, management, raw material prices, and macroeconomic trends. A technical approach assumes that these factors will be reflected in changing stock prices; therefore, analysis of patterns in the movement of those prices will provide sufficient information for forecasting. Fundamental analysis corresponds to the structural approach to modeling political events; technical analysis to the dynamic.³

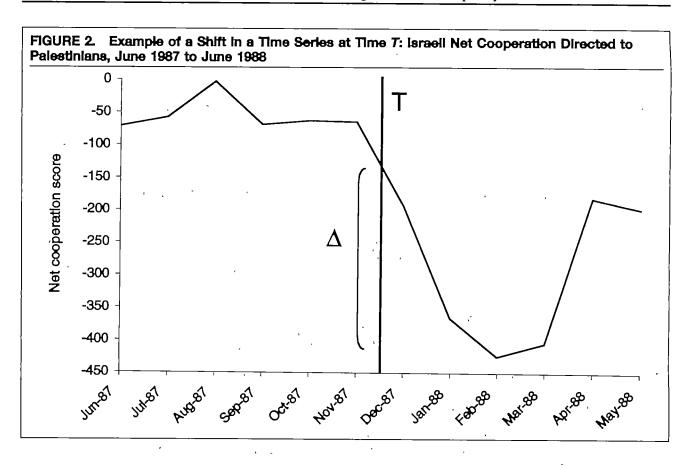

Statistical Characteristics of the Early Warning Problem

The primary goal of time series is to determine the future values of a variable y, given some present and past values of that variable and possibly the present and past values of a set of exogenous variables X. In other words, time-series analysis seeks to determine a function

$$y_{t+k} = f(y_t, y_{t-1}..., X_t, X_{t-1}...)$$

for some k > 0. Due to the importance (and potential financial rewards) of accurate economic forecasts, there is a massive literature on time-series estimation in econometrics (see Hamilton 1994). Standard econometric time-series methods, however, have only limited utility in the problem of early warning, for which the challenge is to identify a time T such that some indicator variable y_t has values consistently different

³ Until relatively recently, technical stock market analysis generally had a bad reputation, due to its use of statistically dubious patterns based on small samples, wishful thinking, and gurus whose fortunes derived more from the sale of books than from trading stock. With the increase in computing power in the 1980s, the situation changed, and "programmed trading systems" can now process sufficiently large amounts of information to generate profits working solely with information endogenous to the market itself. The greater information processing capacity today, in contrast to that available in the 1970s, may have a similar effect on the analysis of political behavior using event data.

(above a predetermined threshold Δ) after time T than before time T:

$$|y_t - y_t'| > \Delta$$
, for all $t > T > t'$.

This is what would occur in aggregated event data following a shift in the type of political behavior in which a dyad is engaged. Figure 2 illustrates this situation for the transition in Israeli-Palestinian interactions that occurred with the outbreak of the Palestinian *intifada* in December 1987.

An additional distinction between early warning research and conventional econometric time-series methods relates to the amount of autoregression in the data. Econometric time series tend to be highly autoregressive: The value at time t is usually close to (or a simple function of) the value at time t-1. Examples of autoregressive series include unemployment figures, prices of consumer goods, and inflation rates. Even series that are potentially less stable, such as stock prices, usually have an autoregressive component combined with generally random noise. For instance, the stock market crash of October 1929 was sudden, whereas the high unemployment rates of the Great Depression required two or three years to develop

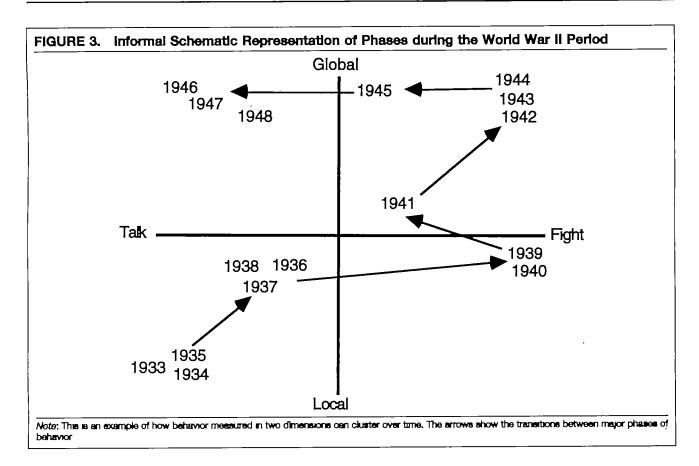

Dynamic early warning models, in contrast, focus on the shifts in a time series that are not autoregressive, even though the series taken as a whole may be autoregressive. An autoregressive model of war and peace will be very accurate, as illustrated by the presumably apocryphal story about the European political analyst who said: "Every day from 1910 to 1970,

I predicted that Europe would remain at peace when at peace, and remain at war when at war, and I was only wrong four times." This type of model is not, however, very useful. It succeeds according to a frequency-based measure but fails according to an entropy-based measure that places higher weight on the prediction of low-probability events (Pierce 1980).

The econometric question most comparable to political early warning is the forecasting of sudden economic shifts, such as those observed in massive exchange rate fluctuations (e.g., the collapse of the Mexican peso or the European Exchange Rate Mechanism). These problems are similar to political early warning in that they are primarily psychological and do not reflect a major change in the underlying physical reality: The economic fundamentals of the Mexican or European economies did not change dramatically during the days of the exchange rate crises, but the perceptions of the future values of the relevant currencies did shift.

Despite these complications, it should be noted that in two very important respects prediction is an easier problem than the typical econometric estimation problem. First, the accuracy of forecasting models can be evaluated probabilistically. Coefficient estimation problems, in contrast, do not have answers: One can always specify an error structure, prior probability, or alternative model that places the estimated emphasis on different variables, and there is no empirical method of deciding among these specifications.

Second, and closely related to the first issue, forecasting problems are not affected by colinearity, which

is the bane of coefficient estimation in the social sciences because every behavior tends to be linked to every other behavior. Coefficient estimates with low standard errors are clearly useful for obtaining a theoretical understanding of a situation, but they are not essential for the pragmatic purposes of forecasting (Wonnacott and Wonnacott 1979, 81). For this reason, it is not surprising that models with very diffuse coefficient structures that do not clearly identify the importance of specific variables—such as neural networks, hidden Markov models, and vector autoregression (VAR)—are found increasingly in early warning research.

CRISIS PHASE AND PREDICTION

The concept of crisis phase is found frequently in the early warning and preventive diplomacy literatures; recent discussions include Alker, Gurr, and Rupesinghe (n.d.), Carnegie Commission for Preventing Deadly Conflict (1997), Gurr and Harff (1994), and Lund (1996). In the empirical literature, crisis phase has been coded explicitly in collections such as the Butterworth international dispute resolution data set (Butterworth 1976), Bloomfield and Moulton's (1989, 1997) Computer-Aided System for Analyzing Conflicts (CASCON; http://web.mit.edu/cascon/), and SHERFACS (http://www.usc.edu/dept/ancntr/Paris-in-LA/Database/Sherfacs.html), developed by Frank Sherman. In a review of these collections, Sherman and Neack (1993, 90) explain:

Conflict is seen "as a sequence of phases." Movement from phase to phase in a conflict occurs as "the factors interact in such a way as to push the conflict ultimately across a series of thresholds toward or away from violence" (Bloomfield and Leiss 1969). Characteristics of disputes can be visualized as the timing and sequencing of movement between and among phases. Processes of escalation of violence, resolution or amelioration of the seriousness (threat of violence-hostilities) and settlement are identifiable through the use of phase structures.

CASCON and SHERFACS, for instance, both code six phases: dispute, conflict, hostilities, post-hostilities conflict, post-hostilities dispute, and settlement. A close analog is found in the DARPA-sponsored work of Phillips and Rimkunas (1983, 181–213), which analyzes WEIS data in a two-dimensional space of threat and uncertainty using Thom's (1975) cusp catastrophe model. Their study successfully locates eight of eighteen crises identified in the WEIS data and produces no false positives.

If the concept of crisis phase is valid, then the international behaviors observed should fall into distinct patterns over time. Figure 3 illustrates this informally for the World War II period, using the two dimensions of talking versus fighting and local versus global involvement. Politics in the years immediately before 1936 were predominantly local and involved little violent interstate conflict. The system shifted to a series of militarized crises between 1936 and 1938, then erupted into a full-scale European war in 1939. After a lull in early 1941, the war spread, first to the USSR and

then to the Pacific; the 1942–44 period was differentiated by a global war. In 1945 this war ended, first in Europe and then in the Pacific, but the postwar politics, rather than return to the unilateralism/isolationism of the prewar period, remained global. The 1946–48 cluster continued to represent the system for most of the Cold War, with occasional departures from that cluster to take in the Korean War, the Suez Crisis, the Cuban Missile Crisis, and similar events.

Figure 3 is obviously idealized. Any analysis using event data will be complicated by the aggregation of dyadic behaviors, the existence of multiple issues determining behaviors, and the fact that real-world political behavior is considerably noisier than the simple summary of international politics in the 1930s and 1940s presented above. Nevertheless, if event data capture the behaviors that characterize a phase typology, then it should be possible to determine those phases using statistical clustering. A cluster occurs whenever the actors in the system respond to each other in a consistent fashion over an extended period (i.e., repeat approximately the same types of actionscooperative, conflictual, or absent-month after month). When the behavior of the dyad changes—for example, from peace to war or vice versa—the system shifts to a new cluster. If the transitions between these phases are gradual, or if interactions that precede a phase shift are distinct from those found when the system is locked in a single phase, then those behavior patterns can be used for early warning of the transition.

A Cluster-Based Approach to Early Warning

To test whether behavioral phase shifts can be used to develop early warning indicators, we analyzed the dyadic behavior of the international actors in the Levant between April 1979 and December 1998. The data were Reuters lead sentences, obtained from the NEXIS and Reuters Business Briefing data services. We coded these leads into WEIS categories using the Kansas Event Data System (KEDS) machine-coding program (Gerner et al. 1994; Schrodt, Davis, and Weddle 1994). We then transformed the individual WEIS-coded events into a monthly net cooperation score for each directed dyad-the actions from a specific source to a specific target—by converting every event to an intensity score, using the numerical scale in Goldstein (1992), and then totaling these numerical values for each of the directed dyads for each month. We examined all the dyads involving interactions among Egypt, Israel, Jordan, Lebanon, the Palestinians, Syria, the United States, and the Soviet Union/ Russia; this gives a total of 56 directed dyads, with 237 monthly totals in each dyad. Appendix A contains additional details on coding and measurement.

TABLE 1. A Priori Phase Assignments						
_ Label	Dates	Months	Defining Characteristic			
Camp Davld	Apr. 1979– May 1982	38	Before Israel's 1982 Invasion of Lebanon			
Lebanon	June 1982- May 1985	36	Israel occupies much of Lebenon			
Taba	June 1985– Nov. 1987	30	Partial Israell withdrawal from Lebanon			
Intifada	Dec. 1987- July 1990	32	Palestinian Intifada			
Kuwalt	Aug. 1990– Oct. 1991	15	Iraq's Invasion of Kuwalt and aftermath			
Madrld	Nov. 1991– Aug. 1993	22	Madrid process: bilateral, multilateral peace talks			
Oslo	Sept. 1993– June 1996	34	Oslo peace process			
Netanyahu	July 1996– Dec. 1998	·30	Netanyahu govern- ment in Israel			

The behavior of this system can be seen by examining the position of the vector

[AB, AC, AD, ..., AH, BA, BC, ..., BH, CA, ..., HF, HG],

where A, B, ..., H are the actors in the system, and each pair of letters represents the total Goldstein-scaled net cooperation for a directed dyad aggregated over one month. The behavior of the system is simply the path that this vector traces over time in a high-dimensional space. In vector terminology, a phase is characterized by a region in the vector space where points cluster over time. If political behavior follows a phase typology, this would be evident by long periods of distinct clusters of behaviors that characterize a phase, with brief transitions between the clusters.

The benchmark for our empirical tests is a set of phases established a priori, based on the dominant political interactions during each period. These phases, shown in Table 1, correspond to the interpretations of "area experts" and are consistent with our own fieldwork in the region. Our discussion will use these a priori clusters as a reference point.

The effectiveness of event-space clustering in early warning depends on whether some measurable characteristic of system behavior changes before the phase transition. In some instances there are few if any precursors to a transition, either because of deliberate concealment by political actors or due to the lack of media interest, as in the examples of Chechnya and Somalia.⁵ Our conjecture is that most political situa-

⁴ We repeated some of our analyses without the USA→USSR and USSR→USA dyads; this change generated only minor differences in the results. (The events involving these dyads include only the USA-USSR interactions reported in the lead sentences of Reuters stories dealing with the Levant, not USA-USSR interactions in general.)

⁵ On the surface, the Rwanda genocide appears to be an ideal case of absent precursors. Yet, in assessing that situation, Ruso (1996) observes that the appropriate facts were available (but incorrectly interpreted) as early as the UN Rapporteur's Report in 1993

tions, however, go through a gradual deterioration (or improvement) over a period of a few weeks or months before a phase transition, rather than manifest a sharp jump. Furthermore, because news-gathering organizations are usually rewarded for correctly anticipating political events, journalists who are present in the region, understand the local politics, and can get their stories accepted by editors and onto the news wires are likely to report the behaviors they perceive to be precursors to any political phase change.

This approach to early warning is similar to the concept of normal relations range proposed by Azar (1972, 184) nearly 30 years ago:

Over a period of time any two nations establish between them an interaction range which they perceive as "normal." This normal relations range (NRR) is an interaction range ... which tends to incorporate most of the signals exchanged between that pair and is bound[ed] by two critical thresholds—an upper threshold and a lower threshold. The upper critical threshold is that level of hostility above which signals exhibited by either member of the interacting dyad are regarded as unacceptable to the other. Interaction above the present upper critical threshold ... for more than a very short time implies that a crisis situation has set in.

The NRR model implies that interactions will cluster, with the diameter of the cluster a function of the upper critical threshold. Consistent with Azar's treatment, we expect that when the system is near the edge of a behavioral cluster, it is in a crisis situation. That crisis will either result in a shift to a new cluster—a phase transition-or be resolved without a transition, in which case the system's interactions will return to the core of the cluster. Unlike Azar, we assume the system is moving away from normal behavior when it consistently nears (or passes) the edge of a behavioral cluster, rather than when it exceeds a single critical threshold. We have generalized Azar's NRR concept by looking at changes in a large number of dyads simultaneously (whereas Azar looked only at one dyad at a time), and we use a standardized metric based on correlation, whereas Azar used a Euclidean metric and established distinct critical ranges for each dyad. Finally, we also look at the density of clusters, defined as the average distance between the points in a cluster, over time. Behavior within the NRR should result in dense clusters, but when a system moves away from one phase/ cluster/NRR and into another, there will generally be a period when the points do not cluster densely.

Detection of Phase Using Clustering over Time

Most widely used clustering algorithms are cross-sectional and do not incorporate the time-series element

(Degni-Ségui 1994). Ruso (1996, 8) concludes. "The authors answer Yes to the question, Did those with the capacity to prevent and mingate the genocide have the information from which such a conclusion might be drawn? In fact, they note that specific information about plans and conspiracles towards this end was picked up by the UN system, most significantly in the notorious Black File of January 1994."

of event data (see Aldenderfer and Blashfield 1984; Bailey 1994; Everitt 1980). A cross-sectional method will not necessarily produce credible time-series clusters. Because the Levantine subsystem as we have defined it does not include all relevant interactions, such as the end of the Cold War, points that are distant in time may still bear a superficial resemblance.

Including time as the dominant dimension simplifies the delineation of clusters. The algorithm we employ in this study is uncomplicated: A new cluster is established at a point x_i , when the distance between x_i and the points before it is greater than the distance between x_i and the points after it. This can be expressed in the equation

$$LML_{t} = \frac{1}{k} \sum_{t=1}^{k} \|x_{t} - x_{t-k}\| - \frac{1}{k} \sum_{t=1}^{k} \|x_{t} - x_{t+k}\| > \Delta.$$

LML is the lagged distance minus leading distance; x_t is the Goldstein-scaled net cooperation score for month t;

$$||x_t - x_{t\pm k}||$$

is the distance between x_t and $x_{t\pm k}$ according to some metric; and Δ is a threshold parameter that prevents new clusters from being formed because of random fluctuations in the event data that are unrelated to phase transitions.6 (A large negative value of LML, means that the point is still firmly in the current cluster, that is, much closer to points in the past than to points in the future. When the LML, value is strongly positive, it indicates the point is far away from past points and close to future points.) From the perspective of cluster analysis, this approach is similar to the minimum spanning tree approach (see Backer 1995, chap. 1) in dividing the clusters at places where a large gap is found between adjacent points; it differs in using the dimension of time rather than a graph to determine which points are adjacent.

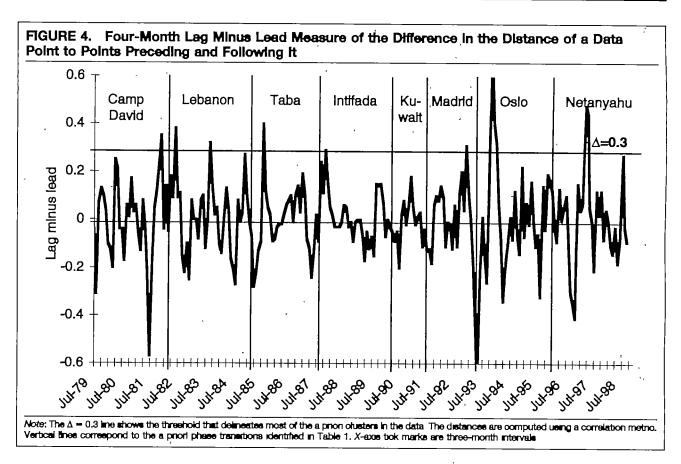

In our analysis, k is measured in months, although in principle it could represent some other interval, such as weeks or even days. The threshold Δ is a free parameter whose value depends on the level of differentiation the analyst wants between the clusters (and the characteristics of the data being used to measure the political activity). For example, if Δ were set to a very high value, such as 0.8, then we would see only two clusters in the data: pre-Oslo and post-Oslo. If it were set to a low value, such as 0.15, then we would find several additional subclusters within the a priori clusters specified in Table 1.

Figure 4 shows the results of analyzing the Levant data set using this algorithm for k=4 and the correlation metric

$$||x_t-y_t||=1-r_{xy},$$

where r is the Pearson product moment. (In other words, this metric is based on the correlation between

⁶ These calculations were done with a simple (600-line) Pascal program that produced various tab-delimited files that were read into Excel to produce the figures.

the Goldstein-scaled scores of the 56 dyads at two times.) The vertical lines on the graph correspond to time points where the a priori cluster divisions from Table 1 are located.

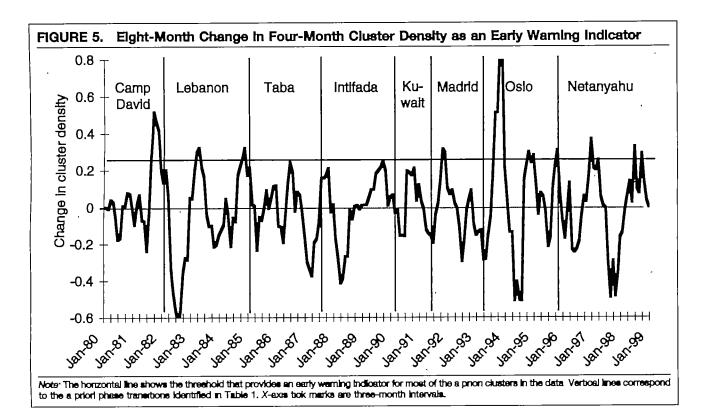

A cluster division occurs when $LML_i > \Delta$. With the threshold level set at $\Delta = 0.30$, the LML measure, by increasing sharply at or very close to the demarcation lines, correctly identifies four of the seven phases determined a priori: Lebanon, Taba, intifada, and Oslo. Several other plausible transitions are suggested by peaks that do not correspond to the original phases: (1) a pre-Lebanon change, probably reflecting increased tension between Israel and the PLO in 1981; (2) two pre-Taba changes that may correspond to shifts in Israeli, Syrian, and U.S. policy in Lebanon (including extensive diplomatic activity related to the May 17, 1983, agreement and its subsequent abrogation); and (3) a transition in January 1993 that may reflect the change in U.S. policy toward the Middle East that occurred with the shift from the Bush to Clinton administrations. Finally, the analysis identifies March 1997 as the end of the Oslo period. This is reasonable. Although the Netanyahu government came to power in the June-July 1996 period, it was nominally committed to continuing the Oslo peace process initially, and the observed nine-month delay before the end of that process, while unanticipated, is in retrospect unremarkable.

Our LML measure misses two previously chosen transitions: the Kuwait war and the Madrid phase. Including the Kuwait transition as an a priori phase was probably an error. Although Iraq's invasion of the

emirate and the subsequent war had profound implications for the Levant, the initial interactions that characterize this period occurred among actors outside the group we are studying, so it is not surprising that the data do not reflect it. It is less obvious why we fail to identify the Madrid transition. This failure might also be a side-effect of the Kuwait invasion. Much behavior during late 1990 and 1991 was due to circumstances outside the Levant, so the very real shift in politics that accompanied the Madrid process may have been less apparent in the data than were the other transitions.

Change in Cluster Density as an Early Warning Indicator

The LML measure cannot be used for early warning. It requires information from both before and after a phase transition, so it can only be used to delineate clusters of behavior retrospectively. Consequently, in order to develop an early warning indicator, some alternative measure is required. An examination of Figure 4 shows that the LML measure often begins a rapid increase several months before a phase transition. This is consistent with the underlying theory: The changing interactions in the system cause the points to pull away from the cluster center before a final break, rather like what happens when pulling on a piece of taffy. This pattern suggests that a decrease in cluster density—the extent to which the points within the cluster are close—may serve as an early warning. Since a change in cluster density can be determined solely on

the basis of information available up to and including time t, it can be identified prospectively.

Figure 5 shows the behavior of the cluster density change (CDC) measure. The measure is calculated by first computing the average total distance between the points in a cluster of four consecutive months,

$$CD_{t} = \frac{1}{6} \sum_{i=0}^{3} \sum_{j=i+1}^{3} ||x_{t-i} - x_{t-j}||,$$

and then calculating the difference between CD_t at points that are eight months apart:⁷

$$CDC_t = CD_t - CD_{t-8}$$

The CDC measure generally corresponds well with both the a priori phases and LML-identified transitions, despite the fact that the LML clusters were based on post-hoc information. At each point where the CDC exceeds a threshold set at one standard deviation (0.23), there is a corresponding LML cluster transition within 1–10 months of the point, as seen in Table 2. Unlike the LML measure, the CDC analysis does identify the Madrid transition—it exceeds the 0.23 level in November 1991 ($x_t = 0.24$) and December

1991 ($x_t = 0.27$)—but still fails to show the Kuwait transition. A peak in the CDC measure in October 1989 ($x_t = 0.24$) probably corresponds to the decline of reports of activity in the Palestinian intifada (Gerner and Schrodt 1998); the peaks in early 1995 and 1996 may reflect changes associated with the problems encountered in the Oslo peace process before the cluster break identified in March 1997.

The CDC measure is continuous and can be interpreted as proportional to the probability that a major change will occur; most of the event data models developed in the 1970s provided only a yes/no prediction of change. From the perspective of early warning analysis, the disadvantage of CDC is that it indicates only that some sort of systemic shift is pending; it tells nothing about what form that change will take. Furthermore, the phases determined by CDC do not necessarily correspond to the overt military-political changes that one might wish to forecast with an early warning system.

This is most conspicuously the case for Lebanon in 1981–82. According to the CDC measure, the system shifted into the Lebanon phase about a year before the Israeli invasion in June 1982. At the time of the actual invasion, the CDC measure is at one of the lowest points seen in the entire time series. On the one hand, the Israeli policies that culminated in the invasion were put into effect long before, so placing the true phase shift in mid-1981 is politically plausible. It is widely accepted that Israel planned the invasion of Lebanon as much as a year in advance, and then engaged in provocative military maneuvers throughout the first half of 1982 in an effort to good the Palestinians into a

⁷ There are six possible comparisons within a cluster of four months: x_i to x_{i-1} , x_i to x_{i-2} , through x_{i-2} to x_{i-3} . Therefore, the divisor six is used to compute the average. The lag of eight months was established empirically. In other regions of the world it may be shorter or longer, depending on the time required for political decisions to be made. The choice of eight months is not critical. Because the CDC_i calculation involves data from two periods of four consecutive months, values of CDC_i at lags one or two months shorter or longer than the eight-month lag employed here will be strongly correlated with the eight-month value.

initial Date of Cluster	Political Characteristics	A Priori	LML Cluster	Nearest

The a priori ofuster break was two months earlier, in June 1985

"The a priori cluster break was almost a year earlier, in November 1991.

response that would justify armed intervention (Gerner 1994; Hiro 1992; Jansen 1982; Morris 1999, chap. 11; Petran 1987; Randel 1983; Reilly 1983). On the other hand, the situation on the ground looked very different in July 1982 than in April 1982, a period during which the CDC measure plummeted. This is clearly not a "barometric" early warning that allows a political analyst to say: "The CDC indicators are real low this month, nothing to worry about." This may be because CDC is based on a correlation distance and is sensitive to changes in policy configurations—who is coordinating policy with whom—rather than to the direction of change. Using CDC as an early warning in combination with a Euclidean measure sensitive to the direction of change might provide both types of information.

Our research generally supports the crisis phase model, but the measures are somewhat ad hoc. How do we know our findings are not simply a statistical artifact, reflecting a combination of chance and self-deception? In Appendix B we compare our results to those obtained with a randomly generated simulated data set that has the same mean, variance, and auto-correlation as the observed data. The Monte Carlo analysis of the LML and CDC measures found that these two indicators behave quite differently in the randomly generated simulated data sets and in the observed data. This suggests our results are due to actual political characteristics in the region and are not simply an artifact of the clustering methods.

SUMMARY OF FINDINGS

Table 2 summarizes the empirically determined clusters in Levantine political behavior for the period studied. For the most part, these divisions correspond to the a priori clusters; when they do not, the differences are plausible. The LML cluster analysis identifies two phases that were not part of the a priori set. The first is an increase in tension between Israel and the Palestinians before the Lebanon invasion; the second is a postinvasion, pre-Taba period that corresponds to continuing instability and the Israeli withdrawal from the area around Beirut. The end of the Oslo phase occurs about nine months into the Netanyahu administration; we did not anticipate this particular date, but it is quite plausible.8 The CDC measure—although not the LML cluster analysis—indicates significant changes following the Oslo phase. Based on CDC, we might also have designated a postintifada, pre-Madrid cluster beginning in late 1989. All our analyses missed the Kuwait transition.

The CDC score probably corresponds to the end of the intifade and the Synan consolidation of power in Lebanon, rather than a forecast of the Kuwart invasion.

⁴A break at some point during the Netanyahu government period was anticipated, the exact timing was not

⁸ This cluster break occurs near the splice between the NEXIS and Reuters Business Briefing (RBB) sources: The "leading" cluster for March 1997 contains about ten weeks of NEXIS data and about six weeks of RBB. It is possible that the change in data source affects the delineation of the cluster, but this seems unlikely for three reasons. First, this cluster shift is consistent with the changing policies of the Netanyahu administration. Second, the cluster break is anticipated by four months in the CDC measurements that contain no RBB data. Finally, most of the LML scores across the splice are quite low: Many are close to zero, and only the March and April 1997 calculations show evidence of a shift in behavior.

The CDC measure usually provides two to six months of warning, but it gave no signal of the Oslo transition and no distinct alert before the June 1982 invasion of Lebanon. The CDC measure also has some false positives where it peaks just below the critical level. This is to be expected: Any measure that does not contain false positives is probably insufficiently sensitive to political events. For example, the several CDC peaks associated with the Oslo and Netanyahu periods are consistent with the fits and starts of that negotiation. More generally, we have not included in this model interactions among domestic actors—such as the various political parties and factions within Israel and Lebanon, and sometimes those interactions can be important. We are not dealing with a deterministic system, and at times a false positive may reflect precursors to transitions that failed to occur because of a reaction in the international system or in domestic subsystems that prevented the phase change.

The pre-Lebanon peak in LML may be an example. In 1981, allies of Israel may have persuaded Prime Minister Menachem Begin that an invasion of Lebanon would result in eventual Syrian hegemony there, the development of a militant Islamic fundamentalist movement on Israel's northern border, and the end of Begin's political career. Only after another year had passed did the contrary and disastrous design of Defense Minister Ariel Sharon prevail.

CONCLUSION

With the end of the DARPA-sponsored research, the development of quantitative early warning models went into eclipse. When evaluated against what is possible today, the DARPA efforts were necessarily primitive in their dependence on human coding and mainframe computers with only a tiny fraction of the speed and memory now available. The event-based quantitative forecasting efforts of the late 1970s were unsuccessful, but the contemporary situation is quite different. The quantity, consistency, and timeliness of event data have improved substantially due to the advent of machine-coded data sets based on news wire sources. With increased computer power and greater sophistication of statistical research in international relations, a variety of new early warning techniques can now be applied to that data.

We draw two general conclusions from our analysis of time-delimited clusters. First, the empirical results support both the theoretical concept of crisis phases and the strategy of analyzing the movement of a point defined by the vector of dyadic interactions in an international system. The pattern of variation in LML_t seen in Figure 4 is exactly what we expected the model to generate: brief periods of large movement followed by long periods of little movement.

These time-delineated clusters are much cleaner and more consistent than clusters determined by cross-sectional techniques, such as the K-Means analysis found in Schrodt and Gerner (1997). The $LML_t > \Delta$ method we used to delineate the clusters is conceptually straightforward and computationally efficient; in

fact, the algorithm is sufficiently simple that it may be possible to determine analytically some of its statistical properties. Nonetheless, it locates most of the clusters we expected to find.

The CDC measure also appears promising as the basis of an early-warning indicator. It provides a two-to six-month warning for most of the changes in the data set, and its behavior is consistent with the theoretical predictions of the crisis phase approach. Both the LML and the CDC measures act quite differently in real-world and simulated data, which suggests that they reflect underlying political behavior rather than statistical artifacts.

Time-delimited clusters are a dynamic rather than a structural early warning approach, but their effectiveness should not be regarded as evidence against the structural approach; we regard these two research strategies as complementary rather than competitive. Structural methods are particularly good at telling analysts where to look for potential trouble, and they are apt to provide theoretical guidance about why a specific system is likely to experience problems. This, in turn, may provide insights into the types of action to take to resolve an impending crisis. Structural models are unlikely to excel at predicting the exact timing of breakdowns, however, because the variables they identify as theoretically important change much too slowly. This is where dynamic models come into play.

Our analysis does not consider an alternative class of dynamic models, those based on event sequences, rules, patterns, and precedents (see Cimbala 1987; Hudson 1991). These models generally provide more contextual information than is supplied by numerical time-series methods. As a consequence, they, too, may be useful in identifying the immediate events leading to a crisis. For instance, although the Kuwait transition is invisible in our cluster analysis, the events preceding the Iraqi invasion follow very closely Lebow's (1981) "justification of hostility" crisis type. Recognizing such patterns could be useful for very short-term forecasting. Also, an assortment of computationally intensive nonlinear forecasting techniques have been developed in recent years (e.g., Casdagli and Eubank 1992; Richards 2000), although relatively little attention has been paid to these in the quantitative international political literature. In short, a variety of unexplored methods may be applicable to the early warning problem.

We believe the ideal early warning model should combine elements of both the structural and dynamic approaches. The optimal model might vary depending on the structural precursors in a specific case. Presumably, an internal breakdown in Lebanon, which is relatively wealthy and highly differentiated by religion, does not occur in the same fashion as a breakdown in Rwanda, which is relatively poor and not differentiated by religion. The literature on domestic conflict and state breakdowns (e.g., Esty et al. 1995, 1998; Gurr and Lichbach 1986) could provide theoretical guidance on this issue.

The reason integrated models have not emerged is due largely to resources: The political science discipline is still developing accurate structural and dynamic models, and no researcher has been able to assemble data sets sufficiently large to study structural and dynamic dimensions simultaneously. As the investigation of both types of models identifies more focused sets of variables and techniques, it should be practical to combine the approaches.

APPENDIX A: DATA SOURCES AND MEASUREMENT

Our source for April 15, 1979, to June 10, 1997, was the NEXIS "REUNA" file; Reuters Business Briefing (RBB) was used for June 11, 1997, to December 31, 1998. The change of sources was required because Reuters stopped supplying data to NEXIS on June 10, 1997. The two data services provide a somewhat different mix of stories, but we see no evidence of a significant discontinuity when the stories are coded and aggregated at a monthly level.

The following search command was used to identify relevant stories in NEXIS:

(ISRAEL! OR PLO OR PALEST! OR LEBAN! OR JORDAN! OR SYRIA! OR EGYPT!) AND NOT (SOCCER! OR SPORT! OR OLYMPIC! OR TENNIS OR BASKETBALL)

To locate stories in RBB, we used the RBB search software (version 2.0 for Macintosh) to select "Political" and "General" news stories that dealt with Egypt, Israel, Jordan, Lebanon, and Syria; the "Reuters Sports" source was explicitly excluded. (The "Israel" category includes stories on the Palestine National Authority as well as Israel.) Some additional filtering was done on both the NEXIS and RBB downloads to eliminate Reuters "Highlights," historical calendars, and other irrelevant material.

The KEDS machine coding program does some simple linguistic parsing of the news reports—for instance, it identifies the political actors, recognizes compound nouns and compound verb phrases, and determines the references of pronouns—and then employs a large set of verb patterns to determine the appropriate event code. Details on the mechanics of the KEDS system are found in Gerner et al. (1994) and Schrodt, Davis, and Weddle (1994). For example, consider the following lead sentence: "Palestinian President Yasser Arafat accused Israeli Prime Minister Benjamin Netanyahu on Tuesday of intentionally prolonging their peacemaking crisis."

The key components of the sentence are
Subject: Palestinian President Yasser Arafat
Verb: accused

Object: Israeli Prime Minister Benjamin Netanyahu Based on the dictionaries used by the KEDS program, the proper noun in the subject—"Arafat" (or the adjective "Palestinian")—is assigned the actor code PAL and becomes the source of the event. The proper noun in the direct object—"Netanyahu" (or the adjective "Israeli")—is assigned the actor code ISR and becomes the target. The event is determined by the verb ("accused") and is assigned a value (121 in this case) corresponding to the appropriate code in the WEIS event coding system. Bond et al. (1997), Huxtable and Pevehouse (1996), and Schrodt and Gerner (1994) discuss extensively the reliability and validity of event data generated using Reuters and KEDS.

We coded only the lead sentences of the stories, which produced a total of 92,687 events. The search command, however, generated a number of events outside the 56 directed dyads considered in this study. Those 56 dyads produced 43,328 events.

The data and the source code for the computer programs used in the analysis, as well as the KEDS program (version 0.9B6.2) and the dictionaries used for this coding session, are available from the web site http://www.ukans.edu/~keds (accessed August 15, 2000).

APPENDIX B: COMPARISON WITH A NULL MODEL

Here we develop a null model and look at the distribution of various indicators in simulated data generated by that model. We wish to determine whether a Monte Carlo analysis using randomly generated data with the same means, variances, and autocorrelations as our Levant dyads will show the same patterns of change in distance that we found in the actual data. If this occurs, it means our results are simply an artifact of the analytical method, rather than a reflection of the underlying politics.

Our null model duplicates the sample size (192) and number of dyads (54) found in an earlier version of the data set, as well as the mean, variance, and first-order autocorrelation of the data within each dyad. Specifically, we generated simulated data using a first-order autoregressive (AR[1]) process,

$$y_t = c + \phi y_{t-1} + \varepsilon,$$

where $c = \mu (1 - \rho)$; $\phi = \rho$; $E(\varepsilon) = 0$; $Var(\varepsilon) = s^2 (1 - \rho^2)$. As Hamilton (1994, 53-4) notes, this will produce a time series with mean μ , variance s^2 , and first-order autocorrelation ρ . In order to avoid initial value effects, the simulated data were taken from the interval $[y_{51}, y_{242}]$, with $y_0 = \mu$. To save computation time, ε were generated by random selection from a table of 5,000 normally distributed random variables produced by Excel 4.0. We created a sample of 1,000 such data sets.

This specification represents a compromise between a null model that is excessively random and one that duplicates all the features of the original data set. On the one hand, in a null model using white noise (no autocorrelation), points generated by the dyads will jump around in the vector space far more than one would ever expect to see in event data based on actual political behavior and presumably will show only very small clusters. On the other hand, if we also duplicate the cross-correlation between dyads, the simulated data set will have most of the statistical characteristics of the actual data, and it would not be surprising to find similar results. Our choice is an intermediate model in which the simulated time series have the same general characteristics within each dyad but have no relationship between dyads. (Autocorrelation above the first order is significant in only a small number of the dyads in the original data.)

In comparing the simulated data with the actual data, we looked at the following measures:

- the total number of points at which $LML_t > \Delta$, with $\Delta = 0.2$, the threshold that best delineated clusters in this 1979-96 data set;
- the number of $LML_t > \Delta$ points that signal a new cluster. This is defined (somewhat arbitrarily) as an $LML_t > \Delta$ point that had no $LML_t > \Delta$ points in the previous two periods. These times are called "cluster-defining points";

⁹ This analysis was done in April and May 1996. Because the simulations are quite time consuming, we have not rerun them with the data set that goes through December 1998. There is no reason to believe that the results would be any different using the newer data. ¹⁰ In other words, this definition ignores the strings of consecutive $LML_t > \Delta$ points that are generated by rapid movements away from

	TABLE B-1. Statistics Computed from 1,000 Simulated Data Sets, $\Delta = 0.2$						
Statistics for $\Delta = 0.2$ ($N = 1,000$)	Simulated Mean	Simulated Standard Dev.	Observed Value	One- Talled Proportion			
Total $LML_t > \Delta$	31.55	5.67	15	0.003 (<)			
Ctuster-defining $LML_t > \Delta$	15.63	2.61	9	0.006 (<)			
St. dev. of CDC	0.30	0.04	0.23	0.026 (<)			
St. dev. of LML	0.25	0.03	0.15	0.001 (<)			
Cluster break at t and CDC _{t-k} > St. dev.							
k = 0	0.41	0.11	0.56	0.090 (>)			
k = 1	0.22	0.10	0.22	0.481 (>)			
k = 2	0.21	0.09	0.11	0 893 (>)			
k = 3	0.20	0.09	0 11	0 869 (>)			
$LML_t > \Delta$ within $t \pm k$ of a priori							
k = 0	0.03	0.03	0.07	0.136 (>)			
k = 1	0.10	0.06	0.27	0.011 (>)			
k = 2	0.17	0.08	0.40	0.006 (>)			
k = 3	0.23	0.09	0.47	0.008 (>)			

- the standard deviation of *LML*, and the early warning measure, CDC; the means of both measures are zero;
- the number of CDC measures greater than one standard deviation above zero at 0, 1, 2, and 3 months prior to a cluster-defining point; and
- the number of $LML_t > \Delta$ points within 0, 1, 2, and 3 months of the six a priori cluster transitions we identified in our data set, as a proportion of the total number of $LML_t > \Delta$ points.¹¹

Because the CDC measure can only be computed after twelve months of data are available, and computing the LML_t requires three additional months, the interval on which these measures were computed contains 192 - 11 - 3 = 178 time points. (The total number of months in a sixteen-year period is 192. We eliminate the first eleven months where the CDC measure cannot be computed and the final three months where the LML measure cannot be computed, leaving 178 months.)

The results of the Monte Carlo analysis are presented in Table B-1, where the "one-tailed proportion" indicates the proportion of the values in the simulated data that are less than (<) or greater than (>) the observed value. The distribution of the values of the statistics are generally smooth, symmetrical, and more or less normally distributed;

an existing cluster; these are quite common in the simulated data and are seen in the actual data in the Lebanon transition. This measure should also be less sensitive to the level of Δ .

the probabilities are based on the actual distributions of the statistics in the simulated data rather than on a normal approximation.

With the exception of one set of statistics—the relationship between CDC and the cluster-defining points—the values observed in the actual data are substantially different from those found in the simulated data and vary in the expected direction. The number of $LML_t > \Delta$ points found in the actual data, whether total or cluster defining, is about half that found in the simulated data. The standard deviations of the LML and CDC measures are substantially less in the observed data than in the simulated data. Generally, an $LML_t > \Delta$ point is about twice as likely to occur near one of the a priori cluster breaks in the actual data than in the simulated data.

The relationship between CDC and the cluster-defining points is somewhat puzzling. The observed k=0 point is significantly greater (at the 0.1 level) than the simulated values, as we expected. The k=1 value, however, is simply equal to the mean, and the k=2 and k=3 values are significantly less than the simulated data at the 0.15 level. This suggests that, on average, CDC_{t-k} may be a better early warning indicator than demonstrated in this data set, although its performance is due to autocorrelation in the data rather than to any more complex political characteristics that involve dyadic interactions.

The large number of $LML_t > \Delta$ points combined with standard deviations of LML and CDC that are higher in the simulated data than in the observed data suggests that the value of Δ —a free parameter that was established arbitrarily—may have been set too low for the simulated data. We reran the simulated data sets with $\Delta = 0.35$, a level of Δ that gives roughly the same number of cluster-defining points in the simulated data as were found in the observed data with

¹¹ In the simulated data, these a priori transitions are arbitrary because they were determined by changes in the actual, rather than the simulated, data. Nonetheless, these indicators measure the likelihood of finding $LML_t > \Delta$ points in the vicinity of a set of six transition points spaced at the intervals in the a priori set. We look at the proportion because the number of $LML_t > \Delta$ points in the simulated data is substantially higher than in the actual data.

 $\Delta=0.2$. This adjustment of Δ effectively eliminated one additional degree of freedom in the simulated data; the results of this analysis are reported in Table B-2.

This modification changes the one-tailed probabilities somewhat but in general does not alter the conclusions of the analysis. The curious pattern of CDC and the cluster-defining points is retained—and actually strengthened at k=2 and k=3—except that the k=0 point is no longer significant. The relationship between the $LML_t > \Delta$ measures and the a priori breaks is slightly less strong, but the k>0 probabilities are still quite low. We conclude that the behavior of the predictive measures is not solely due to the difference in the number of $LML_t > \Delta$ points.

The results of the Monte Carlo analysis are affected by the existence of the free parameter Δ , but in no circumstances do the results from the analysis of random data closely resemble those found in the real data. If we assume the $\Delta = 0.2$ separation threshold, then the observed data have far fewer clusters than we would expect the null model to generate. By raising the level of Δ , we can match the number of empirically determined clusters, but the behavior of the CDC statistic and the coincidence of $LML > \Delta$ points and the a priori points are still quite different in the simulated data. Furthermore, the necessity of raising the value of Δ to match the expected number of clusters means that the number of points at which a large change occurs in LML, is greater in the simulated data than in the observed data because the variance of LML is higher in the simulated data. This in turn would be expected if the observed data actually settle into clusters and remain there for a time—as predicted by crisis phase theories—rather than jump around. We suspect that the standard deviation of LML, is lower in the observed data because of cross-correlation (and in a few dyads, higherorder autocorrelation) of the dyads.

International Law and State Behavior: Commitment and Compliance in International Monetary Affairs

BETH A. SIMMONS University of California, Berkeley

International law have on state behavior? Very little empirical research tries to answer these questions in a systematic way. This article examines patterns of commitment to and compliance with international monetary law. I consider the signal governments try to send by committing themselves through international legal commitments, and I argue that reputational concerns explain patterns of compliance. One of the most important findings is that governments commit to and comply with legal obligations if other countries in their region do so. Competitive market forces, rather than overt policy pressure from the International Monetary Fund, are the most likely "enforcement" mechanism. Legal commitment has an extremely positive effect on governments that have recently removed restrictive policies, which indicates a desire to reestablish a reputation for compliance.

International relations has long been concerned with the role of rules in the organization of international political life. Why do governments commit themselves to international rules, and under what conditions do they comply with their commitments? This is a pioneering area of research for international relations and legal scholars alike (Burley 1993; Chayes and Chayes 1995; Downs, Rocke, and Barsoom 1996; Weiss and Jacobson 1998; Young 1979). What is at stake is whether and to what extent sovereign behavior can be influenced by a legal commitment to rules of conduct. This question, in turn, is at the root of major disagreements between realist and institutionalist theorists in international relations (see Keohane and Martin 1995; Mearsheimer 1994–95).

The literature on international rule compliance is quite disparate in methods, theoretical orientation, and findings. Early quantitative work suggested that much international behavior is consistent with international law, even in the conduct of hostilities between states (Kegley and Raymond 1981; Tillema and Van Wingen 1982). It has been far more difficult to show a convincing causal link between legal commitments and behavior, however. Some progress has been made in the examination of compliance with environmental agreements; in-depth case studies have demonstrated that technical "capacity" is a necessary although not sufficient condition to secure compliance with agreements that require technical policy implementation. Weiss and Jacobson (1998) compare the performance of nine countries with respect to five environmental accords and conclude, among other things, that administrative and technical capacities (including knowledge and training, adequate authority and financial resources,

Beth A. Simmons is Associate Professor of Political Science, University of California, Berkeley, CA 94720-1950 (bsimmons@socrates.berkeley.edu).

The author thanks Henry Brady, William Clark, Robert Keohane, Barbara Koremenos, Brian Pollins, and Eric Schickler for very helpful comments. I also acknowledge the extremely helpful research assistance of Zachary Elkins and Conor O'Dwyer, who assisted with data management and analysis; Becky Curry, who assisted with the legal research; and Aaron Staines and Jennie Wang, who assisted with research and data entry. All errors remain my own.

and access to relevant information) are crucial to compliance (see also Haas, Keohane, and Levy 1993). These arguments are less telling, however, where governments are obligated to refrain from particular activities rather than implement complex technical accords.

Others argue that the domestic regime type is essential to understanding international law compliance (Slaughter 1995). Governments based on the rule of law and, especially, the independence of the judicial branch are, in this view, much more likely to comply with international obligations than those that are not. Liberal democracies are likely to commit to rules that reflect their ideological biases and to comply with them. This proposition has not been put to a rigorous test, but it seems to dovetail with the strand of the democratic peace literature that argues regard for domestic constitutional constraints carries over into the conduct of foreign policy (Dixon 1993; Risse-Kappen 1995).

The most serious challenge to any of these studies is that they are not able to show credibly that compliance is based on anything other than immediate state or governmental interests. This leaves most studies on compliance subject to the criticism that rules add little to our understanding of international relations: They reflect rather than alter governments' interest in pursuing a particular course of action (Downs and Rocke 1995; Mearsheimer 1994–95).

My argument is that international legal rules do alter governments' interests in compliant behavior. International legal commitment is a bid to make a credible commitment to a particular policy stance. The acceptance of treaty obligations raises expectations about behavior that, once made, are reputationally costly for governments to violate. An international legal commitment is one way that governments seek to raise the reputational costs of reneging, with important consequences for state behavior. I demonstrate this effect in the context of the public international law of money, an area in which governments traditionally have guarded jealously their sovereign decision-making status (Cohen 1998). In 1945, for the first time in history a treaty regime was established governing money and the inter-

national payments system, to be administered by the International Monetary Fund (IMF). This agreement required adherents to keep their current account free from restriction. Put most simply, if a bill comes due for imports or for an external interest payment, national monetary authorities should make foreign exchange available to pay it. This obligation is assumed voluntarily, but once made it is legally binding and permanent. The IMF Articles of Agreement provide an opportunity to test whether a rule influences behavior, even when governments face unanticipated circumstances that make compliance inconvenient or even costly in the short run.

The first section provides an overview of the substantive monetary rules under consideration and formulates expectations for commitment and compliance. The second section presents data to address three questions. Why do governments commit themselves to these rules? Under what conditions do they comply? Does commitment to an international rule affect government behavior? The final section explores the findings, provides interpretations, and draws conclusions.

The evidence suggests that legal commitments are crucial to policy choice. Taken as a whole, the findings are most consistent with an interpretation that governments make commitments to further their interests and comply with them to preserve their reputation for predictable behavior in the protection of property rights. Strong regional effects suggest that reputations develop around regional standards of behavior. A positive reputation for respecting the rule of law domestically is associated with compliance, which suggests that whenever possible governments will avoid damaging a valuable reputation for law-governed behavior, this consideration deters them from breaking the law in the international sphere. The influence of a formal legal obligation is especially strong in the first few years after a period of restrictions, which is consistent with the desire of legally committed countries to reestablish their credibility for openness. The implication is that despite the formal ability of the IMF to enforce the rules, it is likely to be the market that "enforces" the public international law of money. The broader message for theorists of international relations is that enforcement need not be overt and centralized to give behavioral rules their bite.

MARKETS AND INTERNATIONAL MONETARY LAW: EXPECTATIONS REGARDING COMMITMENT AND COMPLIANCE

The IMF's Articles of Agreement are the first international accord in history to obligate signatories to particular standards of monetary conduct. Article VIII spells out the general obligations of members, and Section 2 rules prohibit restrictions on the making of payments and transfers for current international transactions. The purpose is to do what international trade

law had been doing for decades: provide a framework that facilitates the exchange of goods, services, and capital among countries.²

Governments may not wish to maintain an open current account for two main reasons. One may be to support developmental objectives that favor certain kinds of transactions (exports, capital inflows) over others (imports, capital outflows) based on established state priorities. The other may be to ameliorate balance-of-payments problems (Edwards 1985, 381–2). Under these conditions, governments usually want to retain the flexibility of intervening to conserve foreign exchange in whatever ways they consider appropriate.

The IMF has always viewed such systems of control as dangerous substitutes for economic adjustment and as inhibitors to the development of free foreign exchange markets. But because many of the IMF's founding members could not immediately achieve full convertibility, Article VIII obligations are voluntarily. Upon joining the fund, new members can avail themselves of transitional arrangements under Article XIV, which effectively grandfather restrictions in place upon their accession.³ Yet, the articles do not specify either a time limit on the transitional period or a set of criteria for ending it (De Vries and Horsefield 1969, 225). The IMF encourages countries it believes are in a position to do so to make an Article VIII commitment, but there are no direct positive or negative incentives.

Furthermore, the IMF does not directly enforce obligations, although it publishes data on states' policies from which one can infer compliance (see the Appendix). The Executive Board can approve restrictions (or not), and this role may be quite important in ensuring a degree of transparency in distinguishing policies consistent with a contingent rule from the exercise of sheer policy discretion. Technically, the Executive Board can declare a member ineligible to use the resources of the fund if it "fails to fulfill any of its obligations" under the articles, and noncompliance sometimes interrupts drawings under stand-by and extended arrangements. The IMF has used these formal remedies very sparingly. Noncompliers rarely

business and tourist travel, family remittances, royalties, dividends, interest, and other noncapital transactions. The articles explicitly permit the regulation of international capital movements (Article VI, section 3).

¹ Current transactions include payment for goods, services, and "mvisibles"—insurance charges, warehousing charges, shipping,

² Article IV, section 1. The original White Plan advocated "the general policy of foreign exchange trading in open, free and legal markets, and the abandonment as rapidly as conditions permit of restrictions on exchange controls" (Horsefield and deVines 1969, 64).

³ Article XIV, section 2. An Article XIV country also can adapt its restrictions without the need for IMF approval, but it cannot introduce new restrictions without approval; cannot adapt multiple currency practices without approval; and cannot maintain restrictions that the member cannot justify as necessary for balance-of-payments reasons (see Horsefield 1969, 248–59).

⁴ Article XV, section 2(a).

⁵ According to Gold (1988, 466): "All standby arrangements include a uniform term on measures that directly or indirectly affect exchange rates. Under this term a member is precluded from making purchases under an arrangement if at any time during the period of the arrangement the member: '(I) imposes [or intensifies] restrictions on payments and transfers for current international transactions; or (ii) introduces [or modifies] multiple currency practices, or (iii) concludes bilateral payments agreements which are inconsistent with

have to worry about direct retaliation, since members that vote for some kind of punishment may be concerned about similar treatment in the future. The fund is much more likely to try persuasion than apply a remedy for continued noncompliance (Gold 1979, 185).

My analysis focuses on enforcement that flows from market rather than official sources (Greif 1992, 1993; Greif, Milgrom, and Weingast 1994; Milgrom, North, and Weingast 1990). The literature on time-inconsistent policy stresses private actors' broadly held belief that a government's optimal ex post policy may differ from its optimal ex ante strategy (Barro and Gordon 1983; Canzoneri and Henderson 1991; Kydland and Prescott 1977; Staigler and Tabellini 1987). In the case of time-inconsistent policies with fixed preferences, it is difficult for a government to commit to refrain from altering policy in the future. Alternatively, one can understand a commitment to Article VIII as an attempt by governments to signal their future policy stance under conditions of incomplete information. In this case, resolving the credibility problem requires the government to be able to signal its "true type." Of course, such a signal is only meaningful if it helps private actors separate true liberalizers from governments that are more committed to other goals, such as redistribution. The key is for the true reformer to be able to send a signal that distinguishes it from a less committed type (Persson 1988; Persson and Tabellini 1989; Spence 1974). Rodrik (1989) emphasizes that in order to send a credible signal of true intentions in an incomplete information environment, a government may have to send a stronger signal than it would in the absence of a credibility problem.

My argument is that Article VIII commitment is one way in which governments may seek to enhance their credibility to markets that doubt their ability or willingness to maintain current account policy liberalization into the future. Governments that are interested in efficiency gains from international transactions have good reasons to establish their credibility through such a commitment. True, there are alternative mechanisms (Rowlands 1993), but few provide as clear a signal or as potentially binding a constraint as an Article VIII commitment. For governments whose credibility suffers from a basic problem of time inconsistency, Article VIII triggers more stringent scrutiny than would be the case with a simple policy pronouncement.

Whatever the source of government credibility, Article VIII raises the costs of policy reversal in three ways. (1) It focuses expectations on a clear codified standard, the exact meaning of which has been authoritatively interpreted by the Executive Board of the IMF. (2) It provides transparency through regular consultations with the fund staff. (3) It mobilizes a new set of external actors (private economic, governmental, government that is considering or engaging in rule violation. Indeed, as Lipson (1991) argues, treaties are

and legal) who may exert pressure to comply on a

designed, by long-standing convention, to raise the credibility of promises by staking national reputation on adherence to them (see also Abbott and Snidal 2000). The potential for incurring costs can be very helpful in making a credible commitment in the first place (Martin 1993).

This is not to suggest that Article VIII is a straightjacket on governmental policy choice, but few international commitments are. In a time-inconsistency framework, contingent rules allow for temporary departures under well-understood circumstances (Bordo and Kydland 1995; Bordo and Rockoff 1996). Recent innovations in signaling models explore the conditions under which reneging on a pledge need not harm reputation: If it occurs under circumstances that are known to be especially adverse, then this action will not reveal how a particular government will behave in more normal times. Rule violation, in extreme cases, is therefore not informative for purposes of developing a reputation (Drazen 1997). Review by the IMF Executive Board regarding temporary approval of restrictions that violate Article VIII obligations provides the flexibility recently incorporated into reputational models.

The literature gives relatively little attention to the problem of establishing credibility in an international setting when there is competition among jurisdictions. An emerging empirical stream suggests, however, that countries with poor protection for investors, measured by both the character of legal rules and the quality of law enforcement, tend to have small and narrow capital markets (La Porta et al. 1997) as well as more limited and costly access to the pool of international capital (Sobel 1999). Studies also have established the link between corruption and other national risks and trends in foreign investment (Ramcharran 1999; Wei 2000). Investors and traders can choose among a range of business venues, and they prefer to do business in venues characterized by a national commitment to the protection of property rights. Therefore, governments compete for international business through various reputational devices (see, e.g., Maxfield 1997) in the same way that they are forced to compete in a broad range of regulatory areas when factors of production are mobile (Aman 1995; Cerny 1994; Oberhansli 1997; Sinn 1999; Tiebout 1956).

The first expectation is policy convergence, especially among countries whose venues are near substitutes for one another. Governments that lag significantly the policies of their more credibly liberal competitors place their business sector at a competitive disadvantage. Yet, economic agents are likely to tolerate noncompliance if it is rampant among similar states. There are two reasons for this, and both relate to the consequences of noncompliance. First, to renege when everyone else does is likely to be interpreted as a situation sufficiently dire to justify the contingency of the rule. In a signaling framework, noncompliance in the context of generalized violation may not provide clear information on a country's future policy intentions. Second, investors and traders incur high costs (and run into collective action problems) if they attempt to punish numerous violators. Noncompliance is

much less costly for a particular government if many others are also in violation. Thus, the decision to liberalize the foreign exchange market is strongly influenced by the policies adopted by international competitors.

The second expectation is that a reputation for the rule of law correlates with compliance. One implication of viewing market pressures as the primary enforcement mechanism for international monetary rules is that a government should be very concerned to develop a reputation for openness and especially predictability. Moreover, governments that have invested in and rest on a stable legal framework at home are unlikely to jeopardize this reputation by lightly flouting international legal obligations. Governments that regularly ignore property rights do not have much reputation to lose. Similarly, after a period of noncompliance, governments committed to Article VIII have an incentive to reestablish their credibility swiftly by returning to predictable, open behavior as soon and as convincingly as possible. In short, a public legal commitment to the international community raises expectations and encourages compliance, even under difficult circumstances. Compliance is enhanced by a decentralized system in which competition and concern for reputation motivate behavior.

COMMITMENT, COMPLIANCE, AND THE EFFECT OF RULES: FINDINGS

Why Commit to Article VIII?

If the reasoning outlined above is correct, then the decision to commit to Article VIII should be strongly influenced by markets that value certainty and policy liberalism. Therefore, the choices of economic competitors should be important factors. Two variables are used here to test this proposition. The first is the proportion of IMF members committed to Article VIII (see the Appendix for all definitions and sources), and the second is the proportion of jurisdictions within a given region that have made such a commitment. The hypothesis is that as the latter proportion increases, so does the likelihood that any given country in that region will make such a commitment.

A serious test requires a battery of economic, institutional, and domestic political controls to minimize the possibility that any regional correlation is spurious. Downs and Rocke (1995) argue persuasively that commitments are endogenous to expectations about future compliance. Because countries with an economy that is vulnerable to sharp swings are likely to find it difficult to comply, susceptibility to balance-of-payments pressure is expected to make a government less likely to accept Article VIII obligations in the first place. Developmental level and the direction of the business cycle also may influence the decision to make a legal commitment with respect to economic policy. Therefore, the following analysis controls for gold and foreign exchange reserves as a proportion of GDP (Reserves/GDP), volatility in this proportion (Reserve Volatility), GDP per Capita, and GDP Growth.

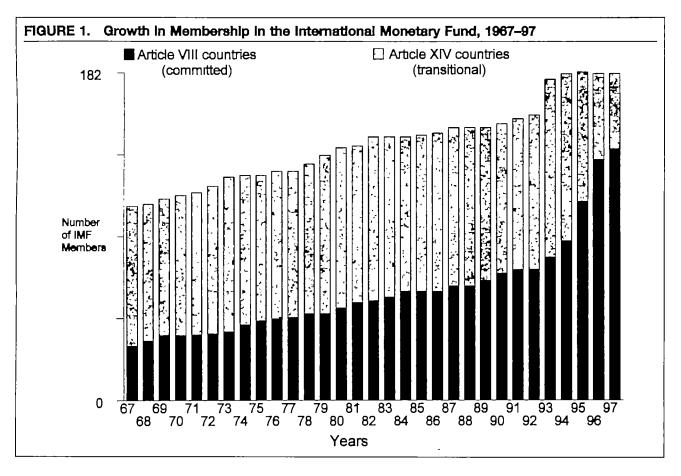

A second set of controls addresses the institutional context. Two of these relate to the IMF's potential role. First, the fund may have policy leverage through the distribution of its resources. If it applies leverage to commit to liberalization, then the use of IMF credits should be associated with a greater propensity to commit to Article VIII. Second, the fund changed its surveillance policy in 1977 in ways that may affect the decision to commit. Previously, governments willing to announce acceptance of Article VIII obligations could avoid multilateral surveillance (Gold 1983; 474-5).6 Article XIV countries, in contrast, were subject to wide-ranging and even invasive "consultations," during which the IMF staff broadly reviewed and the Executive Board passed judgment on the member's balanceof-payments position. Therefore, the acceptance rate should be higher, ceteris paribus, before 1977 than after. The third control in this set relates to the varying degree of flexibility in exchange rates among countries. Flexible rates absorb some of the balance-of-payments adjustment burden and mitigate the need for large reserves to defend the currency. At any given reserve level, greater exchange rate flexibility should be associated with a higher propensity to commit.

Domestic political conditions are another likely influence on the decision to commit to Article VIII. Most obviously, a government may choose liberal policies because that is what the polity demands. Article VIII provides a right of access to foreign exchange for residents and nonresidents, which is a valuable guarantee to the traded goods sector. For importers, it signals to foreign firms that the government is not likely to interfere in the foreign exchange market or to intervene arbitrarily in international business transactions.⁷ This provision is also likely to be favored by export groups, who are concerned with issues of reciprocity and retaliation (Gilligan 1997). Trade dependence should positively influence the legal commitment to free and open foreign exchange markets. Finally, one might expect that civil society's demand for guaranteed foreign exchange access is most likely to be addressed by a democratic regime. In political terms, private interests are likely to oppose the state, which stands to garner concentrated rents as the dispenser of limited access to hard currency. If so, then democratic governance should contribute to a higher rate of Article VIII acceptance.

Before proceeding, a graphic presentation of the data is useful. Figure 1 shows that membership in the IMF has grown considerably over the past three decades, as has the proportion of countries committed to Article VIII. By 1995 a clear majority of members had abandoned transitional status and obligated themselves to openness.

⁶ Consultations with Article VIII countries were established in 1960 but were completely voluntary (de Vries and Horsefield 1969, 246–7).

⁷ According to de Vries and Horsefield (1969, 285–6), for example, "Article VIII status had come to signify over the years either that a country had a sound international balance of payments position, or that if its payments position was threatened, it would avoid the use of exchange restrictions"

For many countries, the transitional period was lengthy, as indicated by the Kaplan-Meier "survival function" in Figure 2, which uses yearly observations for 153 countries who were members by 1995.8 The Kaplan-Meier function estimates about a 25% chance of accepting Article VIII status in the first five years of IMF membership, a 50% chance within 31 years, and about a 75% chance after 40 years. Clearly, many countries have not rushed to make a legal commitment to keep the current account free from restrictions.

What factors affect the rate of acceptance of the obligations under Article VIII? Note that this is a unidirectional decision: Once made, it cannot be rescinded, although a country can fail to comply with its commitment (discussed below). I use techniques of survival analysis that focus on the spell of time until the event of interest occurs (in this case, an Article VIII commitment). A hazard model is appropriate in this case because it captures the accumulation of "risks" over time that affect the decision to commit.9 Specifically, I employ a Cox proportional hazard model to

examine the effects of a number of continuous and categorical predictors; because some of these vary over time, the tests presented here use time-varying covariates. The Cox model estimates a "hazard rate" for Article VIII acceptance at a particular moment, 10 and this hazard rate is modeled as a function of the baseline hazard (ho) at time t, which is simply the hazard for an observation with all explanatory variables set to zero, 11 as well as a number of explanatory variables, the estimates of which indicate proportional changes relative to this baseline hazard.

Table 1 presents the findings of the Cox proportional hazard estimation for the variables discussed above. (Note that a ratio of more than 1 indicates an increase in the rate of Article VIII acceptance, and a ratio of less than 1 indicates a reduction in the rate of acceptance.) Model 1 is a reduced form version that includes only relevant variables for which a very strong case can be made that they are exogenous to the commitment decision. Models 2-4 present the effects of variables that are arguably endogenous to some degree, as well as other exogenous variables for which one cannot reject the null hypothesis of no effect on the baseline

The literature usually terms the event of interest a "failure" and the time elapsed until its occurrence as "survival," regardless of the substantive problem modeled. Proponents of international openness and free markets would view "survival" analysis as "transition" analysis and an Article VIII commitment as a "success"; those who favor closer government management of markets might consider the customary appellations more apt.

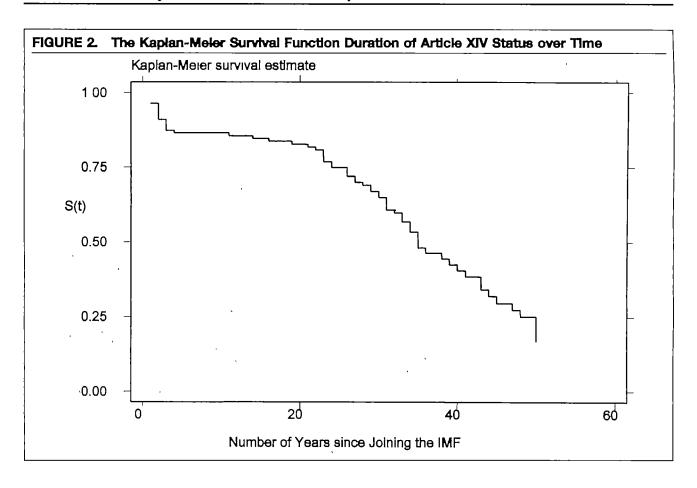

⁹ The hazard model is more general than a panel probit because it allows the underlying probability of committing to Article VIII to change each year. In addition, the structure of the data (all 0s and a single switch to 1 at the point of each country's commitment) is

analogous to "death" in the epidemiological studies in which such models are frequently employed.

¹⁰ The hazard rate is defined as:

 $h(t) = \frac{\text{probability of accepting Art. VIII between times } t \text{ and } t + 1$ (probability of accepting Art. VIII after time t)

¹¹ In this case, I have set all variables to their minimum value in order to avoid interpretations based on deviations from unobserved values of the explanatory variables.

hazard rate. Data availability causes the sample size to change somewhat, but none of the conclusions discussed below are altered substantially by analyzing a common sample.

The first two variables, Universality and Regional Norm, test the proposition that taking on an obligation is likely to be related to similar actions by others. Both of these have a large and positive influence on the acceptance rate. According to model 2, for example, every increase of one percentage point in the proportion of IMF members who accept Article VIII increases by 5.5% the likelihood of acceptance by other members. A similar increase in the regional proportion of Article VIII adherents increases a country's likelihood of acceptance by 2.7%. This translates into an increase of 31% in the rate of acceptance for every increase of 10% in regional accession.12 Clearly, as the number of countries who adhere to Article VIII increases, there is a much greater chance that an uncommitted government will do so. Note that this effect is significant even when controlling for time (Year in model 4), which reduces the likelihood that the universality and regional norms variables simply reflect an increase in adherents over time.

There is also evidence that institutional incentives make some difference in Article VIII acceptance. Surveillance (a dummy variable with the value of 0 before 1977, 1 thereafter) has the expected negative

effect, although it is not robustly statistically significant for this sample of countries, many of which joined the IMF after surveillance became mandatory for all members. Moreover, the coefficient is significantly weakened by including year as an explanatory variable. This is understandable, since surveillance is a dichotomous dummy that distinguishes years before and after 1977. Flexible exchange rates probably increase the likelihood of making an Article VIII commitment, since these minimize the foreign exchange reserves needed to defend a beleaguered currency, but the statistical significance varies with the model specification.

Perhaps most interesting is the fairly strong and consistent negative effect of the use of fund credits on the Article VIII decision. This provides evidence that the IMF is not effectively using resources as leverage to pressure borrowers into making a legal commitment.¹⁴ In fact, *Use of Fund Credits* reduces the proportional

 $^{^{12}}$ This is calculated by raising the estimated hazard ratio to the tenth power.

¹³ For countries that had joined the IMF by 1980, earlier research shows that the change in the surveillance regime had a very strong negative effect on the decision to commit to Article VIII, which indicates a rather perverse incentive to commit. Mandatory surveillance for all countries drastically reduced the probability of accepting Article VIII by countries that were members during the regime change (Simmons 2000).

¹⁴ This finding is consistent with archival research, which suggests that the IMF is more likely to recommend that a country delay commitment to Article VIII when its balance of payments is under pressure (Simmons 2000). The reason is that such a commitment not only would lack credibility but also would allow the "leakage" of IMF resources to pay private creditors rather than to buy time for the government to make fundamental economic policy adjustments

Explanatory Variable	Reduced form Model 1	Model 2	Model 3	Model 4

hazard rate by about 44% (model 1), which is consistent with an argument that links fund assistance with problems of moral hazard. This result makes sense in light of the signaling literature, which suggests that contingent aid makes it much more difficult for a government to signal its true intent about future policy to the market (Rodrik 1989). Because such a signal would be difficult to interpret, there is little reason for a borrowing government to send it.

Domestic political demands that flow from trade openness also have an important influence on the acceptance rate. Openness to the international trade system raises the proportional hazard rate significantly. According to model 1, every increase of one point in imports plus exports as a proportion of GDP increases by .8% the likelihood of Article VIII acceptance. This can account for a difference of 26% in acceptance probability for countries with trade profiles as different as, say, Malaysia (where imports plus exports approxi-

mate 80% of GDP for the period under consideration) and the Philippines (where the corresponding ratio is a little more than 50%). The presence of a democratic regime has no independent effect on the propensity to commit to openness (model 3).

Finally, the economic controls basically fulfill expectations, although most fall short of traditional standards of statistical significance. A commitment to external liberalization is more likely under good and improving economic conditions. High per-capita income, high GDP growth, and strong reserves of foreign exchange are likely to influence a government to commit (the latter two with a probability of <.10). Reserve volatility, although not statistically significant at traditional levels, is correctly signed.¹⁶ What is

 $^{^{15}}$ This is calculated by raising the estimated hazard ratio to the 29th power.

Note. The dependent variable is current account restrictions. The range of analysis is Article VIII countries only, 1982–96. The results are for a logit model with correction for time dependence of observations coefficients (robust standard errors). Three cubic splines were included but not reported here. For model 4, Δ prob refers to the effect on the producted probability of a restriction of an increase of two standard deviations in the variable's value (centered on its mean), with all other variables held at their means, with the exception of use of fund credits and the cubic splines, which are held at 0. For use of fund credits and the cubic splines, which are held at 0. For use of fund credits, Δ prob is calculated moving from 0 to 1. $^{\circ}p > |Z| = .06$.

interesting is the apparent strength of external behavior as an influence on the commitment decision, even when controlling for economic conditions to which governments obviously feel pressures to respond. This seems to suggest that "peer pressure" in a competitive market context, rather than either IMF pressure or economic conditions alone, are in part driving the willingness of governments to make a legal commitment to a liberal international monetary policy.

Why Comply with an Article VIII Commitment?

Members of the IMF are legally required to fulfill their commitment to keep the current account free from restrictions and to maintain unified exchange rates. Although 38 members have a perfect record on both

volatility were also analyzed. The results were imagnificant and are not reported here.

counts,¹⁷ the same cannot be said for the countries listed in Table 2. Most of the long-term noncompliers are concentrated in Latin America, despite the marked trend toward liberalization in this region during the mid-to-late 1990s. The global financial crisis of 1996–97 elicited foreign exchange restrictions in a number of Article VIII countries that otherwise had exemplary records (e.g., Singapore and Korea).

What explains the variance in compliance among countries that have chosen openness? This section focuses only on cases in which governments have

¹⁷ As of 1997: Armenia, Bahrain, Canada, Denmark, Djibouti, Estonia, Finland, Gambia, Germany, Hungary, Indonesia, Kiribati, Kyrgyz Republic, Latvia, Lebanon, Malaysia, Marahall Islands, Mauritius, Micronesia, Mongolia, New Zealand, Norway, Panama, Portugal, Qatar, Russia, San Marino, Saudi Arabia, Seychelles, Spain, Sweden, Switzerland, Thalland, Trinidad and Tobago, United Arab Emirates, United States, Vanuatu, and Yemen Arab Republic. There are very few yearly observations on several of these cases, however.

committed to Article VIII and then implemented restrictions on the current account. ¹⁸ The most obvious explanation is economic pressure that makes the maintenance of an open current account and unified exchange rates very difficult. Certainly, that is a likely factor in Latin America in the 1980s and in Asian countries in recent years. In the tests that follow I present results that control for Average Balance of Payments/GDP, Terms of Trade Volatility, and World Interest Rate Shocks. These are chosen not only because they can have a substantial effect on the ability of governments to maintain a current account free of restrictions, but also because they are unmistakably exogenous to a government's policy at any particular time.

My central concern is the pressure that the behavior of other similarly situated countries places on the decision to comply. Investors and suppliers should prefer to do business in countries whose legal framework protects international contracts. In Table 3, Regional Noncompliance reflects the extent to which countries within the same region have implemented restrictions on current accounts. On the one hand, the expectation is that if Article VIII countries in the region often disregarded their commitment, then the probability increases that any given country in that area will not comply. On the other hand, the more competitors are willing to comply, the greater is the pressure for any one country to comply, even in the face of conditions that favor protecting the national economy through restrictions.

The institutional context also may be important for the compliance question. First, if the IMF is "enforcing" liberal legal obligations through the conditional distribution of resources, then one would expect the use of these credits to be associated at the margin (i.e., controlling for economic conditions) with compliance. Second, compliance may be more palatable if it is not essential to maintain reserves to defend a fixed value of the currency. Flexible rates should be associated with greater compliance.

Finally, it is important to consider characteristics of the domestic polity itself, Several authors imply that compliance with international legal commitments is much more prevalent among liberal democracies, due to the constraining influence exercised by domestic groups with an interest in or a preference for compliant behavior (Schachter 1991, 7; Young 1979; see also Moravesik 1997). In this view participatory politics may pressure the government, especially if noncompliance curtails the rights of residents to foreign exchange. Others argue that the most important characteristic of liberal democracy in terms of international compliance is a strong domestic commitment to the rule of law. The many variants of this argument range from that of Slaughter (1995), who maintains that independent judiciaries in liberal democracies seem to share some of the same substantive approaches to law, to a more general contention that domestic systems that value rule-based decision making and dispute resolution are also more likely to respect rules internationally.¹⁹ In essence, these are affinity arguments: Domestic norms regarding limited government, respect for judicial processes, and regard for constitutional constraints "carry over" into the realm of international politics.²⁰ They rest on an intuitively appealing assumption that policymakers and lawmakers are not able to park their normative perspectives at the water's edge (Risse-Kappen 1995).

There are other reasons to expect the rule of law to be associated with Article VIII compliance. Rule-oflaw countries have a strong positive reputation for maintaining a stable framework for property rights. Markets expect them to keep their commitments, and to undermine this expectation would prove costly. Countries that score low with respect to the rule of law do not have much to lose by noncompliance; erratic behavior is hardly surprising to investors and traders. I use an indicator that is especially appropriate to test the market's assessment of the reputation for rule of law: a six-point scale published by a political risk analysis firm expressly to assess the security of investments (see Knack and Keefer 1995, 225). The scale measures the willingness of citizens peacefully to implement law and adjudicate disputes using established institutions. Higher scores indicate such institutional characteristics as a strong court system, sound political institutions, and provisions for orderly succession. Low scores reflect extralegal activities in response to conflict and to settle disputes.

Because I have argued that compliance is market enforced and that markets prefer certainty in the legal framework, the comparison between the participatory characteristics of democracy and rule-of-law regimes should be especially telling. There is no reason to expect that democracy alone provides the stability that economic agents desire; on the contrary, popular participation along with weak guarantees for fair enforcement of property rights can endanger these rights. It is true that the two variables are positively correlated (Pearson = .265), but they are certainly conceptually distinct and may have very different effects on the decision to comply with Article VIII. In particular, I directly compare two regime characteristics that are often conflated: the participatory dimensions of Democracy and the procedural emphasis of the rule of law. A measure for Bureaucratic Competence is also included to control for the differential capacity of states to intervene in foreign exchange markets.

In this case the compliance decision is modeled using a logistical regression (logit) model; the dependent

¹⁸ This is presented as a priori evidence of noncompliance, even though at this point I do not examine the technical question as to whether the IMF Executive Board approved the restrictions in place, rendering them "legal" temporarily.

¹⁹ This captures the flavor of some of the democratic peace literature, such as Doyle (1986), Dixon (1993), and Raymond (1994).
²⁰ "International law is not unlike constitutional law in that it imposes legal obligations upon a government that in theory the government is not free to ignore or change" (Fisher 1981, 30). Constitutional constraints most often rest on their shared normative acceptance rather than on the certainty of their physical enforcement, which is another possible parallel to the international setting.

variable has a value of 1 for the presence of restrictions, 0 for their absence. (Since I am analyzing only Article VIII countries, restrictions constitute noncompliance.) Because the data consist of observations across countries and over time, with a strong probability of temporal dependence among observations, a logit specification is used that takes explicit account of the nonindependence of observations (Beck, Katz, and Tucker 1998).²¹ The results are reported in Table 3.

One of the most important findings is, again, the clustering of compliance behavior across regions. Article VIII countries are much more likely to put illegal restrictions on current accounts if other countries in the region are doing so. Can this be due to common economic pressures in the region? That possibility cannot be ruled out completely, but it is rendered less likely by the range of economic variables included in the specification. Various measures of the current account, trade volatility, and interest rate shocks failed to wash out apparent regional mimickry. Three other economic variables (GNP per capita, change in GDP, and reserves as a proportion of GDP) were included in the analysis but are not reported here, since they were not statistically significant and did not affect the results reported above. Compliance decisions are apparently not being made on the basis of economic conditions alone but with an eye to standards of regional behavior. The most obvious reason would be reputational consequences in a competitive international economy. Indeed, one possible indication of the importance of reputational pressures may be found in the influence of world interest rates. As these increase (indicating a more competitive global environment for capital), non-OECD governments were much less likely, ceteris paribus, to violate Article VIII commitments, despite the fact that higher rates are likely to increase balanceof-payments pressures.

The domestic political variables tell an interesting story with respect to regime characteristics. First, the evidence is strong that states must have the bureaucratic capacity to renege on their commitments. The strong positive relationship between bureaucratic quality and restrictions implies that these choices are more likely to be made when the capacity exists to implement them. Second, trade dependence has virtually no effect on these results. Third, in contrast with theories of international behavior that concentrate on the law-consciousness of democracies, the evidence here suggests that democracy contributes little or nothing when other factors are held constant, ²² but a strong domestic com-

mitment to the rule of law contributes positively to compliance. In fact, a move from one standard deviation below to one standard deviation above the mean on the rule-of-law scale (from 2.3 to 5.7 on the six-point scale) reduces the probability of noncompliance by .45, according to model 4, holding other variables constant.

If the IMF enforced compliance, we might expect borrowing from the fund to have a strong negative effect on the dependent variable. Yet, the coefficient is positive and statistically significant. The fund is tolerating a good deal of noncompliance when it comes to restricting access to foreign exchange, ²³ a finding that is inconsistent with the successful use of leverage.

To Commit or Not to Commit: What is the Difference?

I now consider whether the law matters. Specifically, does an Article VIII commitment have an independent effect on behavior, once we take into account the obvious economic factors that are likely to lead to restrictions?

In order to answer this question, I examine the entire data set (133 countries, including Article VIII and Article XIV cases, with observations over time averaging 20 years) using logit analysis to explain the existence of restrictions.²⁴ Article VIII commitment is forced to compete with a broad range of economic conditions that clearly are associated with restrictions: volatility in the terms of trade, reserves, and the balance of payments; poor economic growth rates; and low GNP per capita.²⁵

Table 4 presents the results of this analysis. Most of the economic variables have the expected effects, and many are significant. Strong influences are associated with terms of trade volatility and business cycles (both clearly exogenous to the decision to restrict current accounts), balance-of-payment difficulties (reasonably exogenous), and low reserves. But because reserves may be endogenous to the decision to restrict the current account, they are not included in model 1, the reduced form exogenous version. As seen in earlier analysis of the Article VIII countries alone, trade openness is al-

²¹ This solution takes advantage of the fact that annual time-series cross-sectional data with a dichotomous dependent variable are equivalent to grouped duration data. To take explicit account of the temporal grouping of the dependent variable, a counter vector was created, such that t=0 if a restriction is in place or if a country is in the first year of current account liberalization. Successive years of no restrictions are coded 1, 2, ..., n for each year beyond year one. Three cubic splines were then calculated based on this count according to a routine made available on Richard Tucker's website (http://www.fas.harvard.edu/~rtucker/papers/grouped/grouped3.html). The cubic splines were included as explanatory variables, but their coefficients are not reported here. The splines are important as a corrective for assuming that observations are time-independent in this time-series cross-sectional logit framework.

²² For a subset of countries that were IMF members by 1980, earlier

research shows a negative correlation between democracy and compliance with respect to restrictions on current accounts (Simmons 2000).

²³ This is completely consistent with archival research, which has uncovered evidence that stand-by arrangements are often accompanied by the temporary approval of restrictions in order to conserve foreign exchange.

²⁴ The same technique for time-dependence of observations is used as described above.

²⁵ The previous analysis suggests that Article VIII status itself is endogenous, but this endogeneity is not taken into consideration here. First, it is not obvious how to go about creating an instrument for Article VIII, given the structure of the data and the events analysis in the first phase of the argument. Second, a case can be made that one should avoid instruments in cases in which the instrument does not correlate very strongly with the endogenous variable (Bound, Jaeger, and Baker 1995). Third, an anonymous reviewer suggests that the observable variables in the compliance model are very likely to control for nonrandom selection into Article VIII status. For a discussion of controlling for selection on observables, see Heckman and Robb 1985, 190–1.

Pseudo-R ²	.64	.62	.62		

Note The results of a time-sense cross-section logit model are reported; the dependent variable is restrictions on current accounts, coefficients are robust standard errors. Three cubic splanes were included but not reported here. For model 3, Δ prob refers to the effect on the predicted probability of a restriction of an increase of two standard deviations in the variable's value (centered on its mean), with all other variables held at their means, with the exception of use of fund credits, years since last restriction, and the cubic splanes, which are held at 0. For use of fund credits, Δ prob is calculated moving from 0 to 1. For years since last restriction, Δ prob is calculated moving from 1 to 5. $^{*}p > |Z| = 0.6$

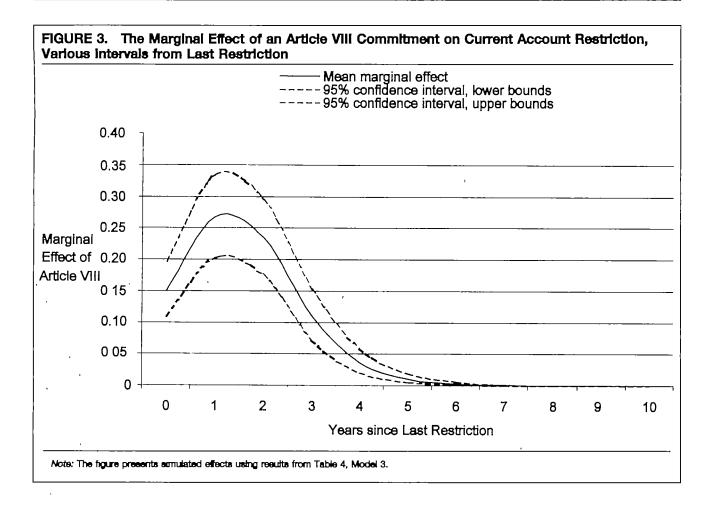

so likely to be associated with liberal policy choice, although certainty does not quite reach standard levels of significance (p < .10). Another interesting finding is that use of fund credits is consistently strongly associated with illiberal policy choice, which again provides evidence that these choices cannot convincingly be explained by fund pressure in the context of extending loans.

Most important for my purposes, however, is that controlling for every likely macroeconomic influence on the decision to implement current account restrictions, a formal declaration of adherence to Article VIII obligations consistently has a strong negative effect on the probability of imposing restrictions. In fact, controlling for all other economic variables as well as for policy inertia, 26 countries that continue to live under

the transitional Article XIV regime have an estimated probability of .87, according to Table 4, model 3, of implementing restrictions; the corresponding probability for an identically situated Article VIII country is only .69. Thus, commitment accounts for a percentage point difference of about 18 in the probability of imposing restrictions on current accounts for the sam-

simulation algorithms developed by King, Tomz, and Wittenberg (1998). These routines have the advantage of producing confidence intervals that take into account the uncertainty surrounding the logit parameters. Conventional methods for calculating probabilities from logit regression assume that the parameter estimates are perfectly estimated and, therefore, do not allow us to report adequately the uncertainty surrounding the probabilities. The simulation algorithms of King, Tomz, and Wittenberg, however, generate a full distribution of parameter estimates that can then be converted to probabilities, a mean can be calculated, and meaningful confidence intervals can be drawn.

Here I report the predicted probabilities as generated by a set of

ple of cases as a whole. Even when we control for the policies of other countries in the region, the legal commitment continues to matter greatly (model 1). Clearly, neither economic conditions nor imitative behavior alone can fully account for the decision to eschew restrictions. The legal commitment itself is an important part of the story.

Interestingly, the effect of the legal commitment is distributed unevenly over time.²⁷ The marginal effects of commitment reported in Table 4 assumed one year had elapsed since a country's previous restriction.²⁸ Figure 3 traces out the marginal effects of commitment on the probability of restrictions as a function of time since the last restrictions. It shows that commitment has the greatest effect in the first two or three years after lifting restrictions. Two years after a restriction, the marginal effect of commitment peaks at about .27, which is a truly significant effect of a legal commitment on behavior. For countries freed from restrictions for the past five years (76 cases), the probability of instituting them is .035 with an Article VIII commitment and .058 without, for a

marginal effect of about .023. There is virtually no independent influence on the legal commitment once a country is six years away from its last restriction.

This suggests that the legal commitment is crucial to policy choice in the first few fragile years of liberalization. That is likely to be a period in which the economy is not yet fully stabilized, and the bureaucratic capacity to intervene may still be available. These conditions provide a severe test of the commitment to maintain liberalization. Governments in Article VIII countries need to convince markets that they are serious about coming back into compliance in order to regain lost credibility. Article XIV countries have much less credibility in the first place. In the absence of reputational effects, there is little evidence that they strive as hard to retain any liberalization they are temporarily able to achieve.

It is not at all surprising that this initial effect should deteriorate over time. The longer a country is free from restrictions, the less likely it is to reimplement them. Over time the bureaucratic capacity to intervene is dismantled. Groups advantaged by the policy are likely to adjust their "portfolios" to the liberalized environment as time passes. This is not to say that a shock would not cause relapse; rather, policy inertia is real, and we should expect it to have a marked influence on outcomes. But this only serves to underscore the effects of the international legal commitment to keep current

²⁷ I have interacted Article VIII with years since last restriction and calendar years and have run analyses in both OLS and logit to see if the results are robust. Nothing changes substantially regarding the importance of making an Article VIII commitment. Additional analysis is available from the author upon request.

²⁸ Denoted as t = 0 for purposes of the counting vector upon which the cubic splines are calculated (Beck, Katz, and Tucker 1998).

accounts free from restrictions. This commitment is a significant factor in whether a liberal inertia has a chance to take hold.

These findings provide fairly strong evidence that legal commitment has a systematic effect on state behavior. It should be underscored that it was shown to affect the propensity to restrict current accounts after controlling for a wide range of economic conditions, the policies of other countries in the region, and the time dependence of observations (policy inertia). It is not easy to counter that these results are merely an endogenous reflection of the actions governments intended to take regardless of a formal commitment. Recall that adherence to Article VIII is a one-way commitment, and in the thirty to fifty years afterward there are certainly likely to be unanticipated occasions on which eschewing restrictions on current accounts proves inconvenient. Nonetheless, in a significant number of such cases, governments apparently decided that their best interests lay in abiding by their commitment to refrain from restrictive policies.

CONCLUSION

The effect of international law on state behavior should be a central concern of international relations scholarship, but few studies have systematically examined this issue. International legal scholars tend to view law compliance as the norm (Chayes and Chayes 1993; Henkin 1979), but political scientists are far more skeptical (Downs, Rocke, and Barsoom 1996; Mearsheimer 1994–95). In the face of daunting conceptual and methodological issues (Simmons 1998), very little evidence has been accumulated to assess basic propositions about why governments commit to and comply with international legal obligations, and whether this makes any difference to outcomes in which we are interested.

The legalization of some central aspects of the international monetary regime after World War II provides an opportunity to inquire into the conditions under which law can influence the behavior of governments in their choice of international monetary policies. In this issue area, we can be fairly precise about what constitutes obligation and compliance, using the IMF's own data. My strategy has been to model the factors that contribute to the rate of Article VIII acceptance, test a set of propositions regarding compliance with this commitment, and assess the effect of that commitment on behavior.

One of the most interesting findings is that the behavior of other countries, especially in one's own region, has far more influence on commitment and compliance than has generally been recognized. Indeed, there is more evidence of competitive policy convergence than of overt pressure from the IMF on borrowing countries. Especially intriguing is the finding that governments are positively influenced by the choices of others in their region. They are more likely to make and to honor a legal commitment if neighbors are doing so. This provides evidence that norms are set and reputations are assessed among groups of roughly

comparable countries, likely through international markets rather than international organizations. Although the IMF undoubtedly has significant influence on some countries at certain times, much more decentralized forces seem largely to be at play.

Among Article VIII countries, two domestic regime effects have clear consequences for compliance. Surprisingly for those who view the international behavior of democracies as somehow distinctive with respect to law and obligation, participatory democracy has little to do with the compliance issue. Regimes based on clear principles of the rule of law are far more likely to comply with their commitments. This indicates that rules and popular pressures can and apparently sometimes do have distinct consequences when it comes to international law compliance. Apparently, governments that provide a stable framework of law and system of property rights domestically are more likely to do the same for international economic transactions. One interpretation is that a credible commitment to a stable system of law is not divisible in the eye of the investor. A rule-of-law government may have even more to lose from noncompliance with an international legal obligation than a more capricious regime.

Perhaps no question has plagued scholars of international institutions as persistently as the challenge to demonstrate that such institutions have a direct effect on state behavior. Does international law order state action? How can we know that governments have not simply committed to do things that they would have done even in the absence of rules? How can we be sure that the rules are not epiphenomenal rather than a constraint on future behavior? "Proof" of such propositions may not be possible, but the evidence presented here addresses such skepticism. Once we control for most of the obvious reasons a government may choose to restrict its current account, Article VIII status still emerges as a truly significant influence on the probability of choosing to restrict. An Article VIII country facing external economic pressures and business cycle conditions matching those of a similarly situated Article XIV country manages much more often to avoid implementing restrictions to cope with these pressures, even if other countries in the region decide to restrict.

This is not simply due to IMF pressure attached to credits, and it is not an artifact of the exchange rate regime. A look at the timing of the estimated effect of commitment reveals something of the law's importance: Significant influence is concentrated in the first few fragile years after a restriction is lifted. Countries that have failed to live up to their obligations seem especially determined to reestablish their credibility. Law seems to matter at a defining moment: Legal commitments can push a country onto a behavioral trajectory of compliance from which it is decreasingly likely to deviate. We should continue to entertain alternative explanations, but these tests indicate that a legal commitment may carry decisive weight in determining some states' international monetary policy.

This article challenges researchers to design projects that will better expose the mechanisms that enhance international law compliance. Does formal commit-

ment trigger greater external reputational consequences associated with noncompliance than does the same policy in the absence of a commitment? Does a legal commitment have consequences in domestic politics that effectively constrain governmental behavior? Does decentralized "enforcement," whether domestic or international, explain patterns of compliance with other sets of rules to which sovereign governments commit? The answers that eventually emerge will have profound implications for both the theory and practice of international relations.

APPENDIX

Dependent Variables

Article VIII Commitment. The variable is scored 1 if a country has accepted Article VIII status, 0 if it remains subject to Article XIV transitional arrangements. Acceptance indicates the end of a "spell" for purposes of the Cox proportional hazard model. Source: IMF various years.

Restriction. Restrictions on payments in current account; scored 1 if restrictions exist; 0 otherwise. When this dependent variable is used only to analyze policies of Article VIII countries, it is interpreted as noncompliance. Source: IMF various years.

Explanatory Variables

Universality. This refers to the proportion of current IMF members, calculated yearly, who have accepted Article VIII status. Source: IMF various years.

Regional Norm. This refers to the proportion of current IMF members within each region who have accepted Article VIII status. Classification of economies by region (East and southern Africa; West Africa; East Asia and Pacific; Eastern Europe and Central Asia; rest of Europe; Middle East; North Africa; Americas) are based on World Bank categories. Source: IMF various years.

Surveillance. This dummy variable indicates whether the period up to and including (0) or after (1) 1977, when a comprehensive regime of IMF surveillance was instituted for all members, whether Article XIV or Article VIII status.

Use of Fund Credit. The variable is scored 1 if a country has made use of IMF credits during a given year, 0 otherwise. Source: World Bank 1995.

Exchange Rate Flexibility. This variable indicates the extent to which exchange rates are flexible (1) versus fixed (0). If the IMF describes a country's exchange rate as "par value applied" or a "unitary effective... fixed rate" (1966–73), I code the case fixed; otherwise it is coded flexible. If the IMF describes a country's exchange rate as "not maintained within relatively narrow margins" (1974–82), I code it flexible, otherwise it is coded fixed. If the IMF describes a country's exchange rate regime as a "more flexible arrangement" (1983–98), I code it flexible, otherwise fixed. Source: IMF various years.

Openness. The measure is imports (total value of goods and services: sum of merchandise f.o.b., imports of nonfactor services, and factor payments at market prices in current U.S. dollars) plus exports (total value of goods and services; sum of merchandise f.o.b., exports of nonfactor services, and factor receipts at market prices in current U.S. dollars as a proportion of GDP. Source: World Bank 1995.

Democracy. The score (ranging from a low of 0 to a high of 10) denotes the degree of democratic institutions within each country. Scores are derived from "subjective codings of the competitiveness of political participation, the openness and competitiveness of executive recruitment, and the level of constraints on the chief executive" (Jaggers and Gurr 1995, 411). Source: Jaggers and Gurr 1996.

Balance of Payments/GDP. The measure is the current account balance (the sum of net exports of goods and nonfactor services, net factor income, and net private transfers as a percentage of GPD, before official transfers) as a proportion of GDP for each country for the period under observation. Source: World Bank 1995.

Current Account Volatility. This is the log of the standard deviation of current account balance as a proportion of GDP (defined above). Source: World Bank 1995.

Reserves/GDP. The measure is central monetary authority foreign exchange reserves (including official holdings of gold valued at London market prices, SDR holdings, reserve position at the IMF) in current U.S. dollars as a proportion of GDP. Source: World Bank 1995.

Average Reserves/GDP. The measure is reserves as a proportion of GDP averaged by country for the period under observation.

Reserve Volatility. This is the log of the standard deviation of reserves/GDP. Source: World Bank 1995.

Terms of Trade Volatility. This is the log of the standard deviation of the terms of trade index, which is the relative level of export prices compared with import prices, calculated as the ratio of a country's index of average export price to the average import price (1987 = 100). Source: World Bank 1995.

World Interest Rate Shock. The measure is U.S. Treasury bill rates, annual average, interacted with non-OECD countries. Source: IMF 1999.

GDP Growth. The GDP average annual growth rate is calculated for the sum of GDP at factor cost and indirect taxes, less subsidies. Source: World Bank 1995.

Regional Noncompliance. This variable is the proportion, calculated yearly, of current IMF members within each region who have committed to Article VIII but who place restrictions on current accounts. For classification by region, see regional norms above. This explanatory variable is used only to analyze policies of Article VIII countries, and is interpreted as noncompliance. Source: IMF various years.

Rule of Law. The measure is a six-point scale that determines where a country's domestic polity falls regarding high (6) or low (0) respect for the rule of law. This variable "reflects the degree to which citizens of a country are willing to accept the established institutions to make and implement laws and adjudicate disputes." Higher scores indicate "sound political institutions, a strong court system, and provisions for an orderly succession of power." Lower scores indicate "a tradition of depending on physical force or illegal means to settle claims." Upon changes in government in countries scoring low on this measure, new leaders may be "less likely to accept the obligations of the previous regime" (Knack and Keefer 1995, 225). Source: International Country Risk Guide

Bureaucratic Quality. A six-point scale measures the extent to which a country's bureaucracy is very capable (6) or incapable (0) of carrying out a range of administrative tasks. For a full discussion of the conceptualization of this variable,

see Knack and Keefer (1995). Source: International Country Risk Guide 2000.

Years since Last Restriction. A vector was created using the STATA routine made available on Richard Tucker's website (http://www.fas.harvard.edu/~rtucker/papers/grouped/grouped3. html). This is coded 0 if the country restricts or is in the first year of lifting a restriction; otherwise, the years of no restrictions are counted.

Decentralization and Inflation: Commitment, Collective Action, or Continuity?

DANIEL TREISMAN University of California, Los Angeles

o political and fiscal decentralization make it easier or harder to control inflation? Statistical analysis of average annual inflation rates in a panel of 87 countries in the 1970s and 1980s found no clear relationship between decentralization and the level of inflation. Political decentralization, however, does appear to reduce change in countries' relative inflation rates over time. By creating additional veto players, federal structure may "lock in" existing patterns of monetary policy—whether inflationary or strict. Among the (mostly developed) countries that started with low inflation, inflation tended to increase more slowly in federations than in unitary states. Among the (mostly developing) countries that started with high inflation, inflation tended to increase faster in the federations. There is evidence that political decentralization locks in a country's degree of practical central bank independence—whether high or low—and the relative hardness or softness of budget constraints on subnational governments.

he pros and cons of political and fiscal decentralization are vigorously debated, but little is known conclusively about its relationship to inflation. Different theoretical premises, supported by different empirical examples, imply opposite predictions. According to one view, inflation is essentially the result of a commitment problem. Policymakers have an incentive to renege on promises of stable monetary growth because unanticipated inflation has a positive real effect. Only if they can restrict their future actions will their promises be credible and a low inflation equilibrium achievable (Barro and Gordon 1983; Kydland and Prescott 1977). Partial devolution of control over spending or monetary policy to lower levels of government may be one way to restrict the center's ability to renege, and competition among subnational jurisdictions to attract investment may reduce the incentive for regional governments to renege (Qian and Roland 1998). In federal systems, different levels of government can police one another, and the central bank may be better shielded from political pressures (Lohmann 1998). Under this logic, decentralization should reduce inflation.

A second argument attributes inflation to a collective action problem. Stable prices are a public good that will tend to be underprovided when the number of actors who must agree to contribute is large (Samuelson 1954). Although the advantages of low inflation are felt by all, the public spending and money creation that cause it accrue to particular beneficiaries. The more

actors there are with leverage over fiscal or monetary policy, the weaker will be the incentive for each to exercise restraint. Under this logic, decentralization, by dividing up authority among different levels of government and increasing the number of relevant actors, is likely to increase inflation.

Examples that support the commitment view are easy to adduce. In Germany and the United States, some scholars have argued, federal institutions and strong subnational governments have helped discipline central economic policymakers and preserve central bank independence (Lohmann 1998; McKinnon 1997). In Germany, a majority of members of the Bundesbank's policy-making council are selected by the Land governments, giving the state governments direct influence over monetary policy. In the United States, although state governments do not have any direct role in monetary policy, the representation of regional reserve banks on the Federal Reserve's policy-making committee may help to ensure that the interest of some regions in loose money is balanced by the interest of other parts of the country in stricter policy. But examples that make the opposite case are also numerous. In various Latin American countries, political decentralization seems to encourage higher public spending, foster excessive public sector borrowing, and weaken the one actor with an encompassing interest in price stability, the central government (Campbell, Peterson, and Brakarz 1991). The hyperinflationary last years of Yugoslavia serve as a particularly clear illustration of the "dangers of decentralization" (Prud'homme 1995).2

A third theory suggests that decentralization will not directly affect inflation but will lock in relative inflation rates, whether high or low, by making it hard to change monetary or fiscal policies and institutions. A federal structure increases the number of veto players whose agreement is required for a change in the status quo,

Daniel Treisman is Associate Professor of Political Science, University of California, Los Angeles, CA 90095-1472 (treisman@polisci.ucla.edu).

For comments and conversations, I am grateful to Miriam Golden, Susanne Lohmann, John Londregan, Ron Rogowski, Tom Schwartz, Andrei Shlerfer, Art Stein, José Tavares, George Tsebelis, Barry Weingast, and other participants in the UCLA political economy hunch, as well as Kenneth Arrow and other participants at the Hoover Institution Seminar on Collective Choice.

Decentralization is defined by various scholars in somewhat different ways. By "fiscal decentralization" I mean the allocation of greater revenue-raising authority and/or expenditure responsibilities to subnational levels of government. "Political decentralization" refers broadly to an increase in the scope of decision making over which subnational governments or legislatures have autonomous authority.

² During the 1980s, control over the Yugoslav central bank slipped progressively from a weakening federal government to the more assertive republics. This exacerbated pressures to inflate the money supply, which hastened the financial and political crisis that undermined the state (see, e.g., Treisman 1996).

and this should make current policy—whether inflationary or austere—more sticky (Tsebelis 1995). The macroeconomic effect of federal institutions will depend in this case on which initial policies are being reinforced. In countries with relatively high inflation, federal institutions will tend to perpetuate the fiscal pressures or politicized monetary system that cause the inflation, and durable stabilization is difficult to achieve. In countries with relatively depoliticized monetary policy and low inflation, federal structures will help perpetuate the underlying conditions.

Regardless of its influence on inflation, decentralization has much to recommend it. Politically, strong local governments are thought to encourage participation, foster civic spirit, and provide a check against central tyranny (Madison [1788] 1961; Tocqueville [1835-40] 1988; Weingast 1997). Economically, competition among subnational jurisdictions may lead to more efficient public good provision, and decision making can satisfy regionally diverse demands more precisely when it is decentralized (Oates 1972; Tiebout 1956). For these reasons, regimes that range from postapartheid South Africa, to postauthoritarian Latin America, to postcommunist Eastern Europe have placed decentralization high on their political agenda. These projects are "in the air" everywhere (Bird 1993); by one scholar's count, they have been adopted in about 85% of developing countries with a population of more than five million (Dillinger 1994). In the developed world, devolution of authority to the states has been a major theme in U.S. politics in recent decades, and Italy, France, and the United Kingdom have all embarked on major decentralization projects.

The benefits of decentralization are better understood than its economic or political costs. If its inflationary consequences are different in different settings, we need to know why and whether the negative ones can be avoided. This article examines that issue empirically. I analyze the relation between political and fiscal decentralization and average inflation rates in a broad sample of countries in the 1970s and 1980s, and I find support for the third view: Decentralization tends to lock in either relatively high or relatively low inflation. Whereas unitary states often change policies rapidly, going from high to low inflation and vice versa, decentralized political institutions make a change in macroeconomic policies, whether good or bad, more difficult. In some (mostly developed) countries, federal structure has helped entrench the practical independence of the central bank and low levels of central government lending. In other (mostly developing) countries, federal structure has served to perpetuate the political vulnerability of central banks and the tendency of central governments to bail out debtors.

In the next section I examine theories about the relationship between decentralization and inflation. I then present a statistical analysis. First, I show that the hypothesis that federal structure enhances the continuity of inflation rates is supported by the data, whereas neither the commitment nor the collective action theory is supported at all. Second, I outline a simple model of how different political and economic conditions as

well as aspects of the fiscal and monetary policy process affect inflation rates. I demonstrate that the key relationships postulated in the model are statistically significant in this data set. I then explore which aspects of fiscal or monetary policy—or political or economic conditions—are locked in by federal structure. Two variables that help determine inflation rates have significantly greater continuity over time in federal than in unitary states: the practical independence of central banks and the share of net lending in central government outlays. I interpret this as evidence that federal structure preserves the relative level of central bank independence, whether high or low, and the relative vulnerability of central government to demands for bailouts, whether high or low. In the last section I elaborate on the implications.

COMMITMENT, COLLECTIVE ACTION, AND CONTINUITY

Most economists and political scientists agree that price inflation is almost always a monetary phenomenon, caused by disproportionate increases in the money supply, and that high (although perhaps not moderate) inflation is both economically costly and politically unpopular. Yet, in scores of countries authorities expand the money supply at inflationary rates. Two views dominate the debate over why this is the case.³

The first attributes suboptimally high inflation to the inability of governments to commit credibly to monetary restraint. All governments press for a high level of monetary growth, regardless of the cost of inflation, for the simple reason that this is their dominant strategy (Barro and Gordon 1983; Kydland and Prescott 1977). On the one hand, if markets expect low inflation, then boosting the money supply has positive real effects; on the other hand, if markets expect high inflation, then it is still less costly in the short run to accommodate these expectations than to thwart them. High inflation occurs in equilibrium, although both markets and policymakers view it as an inferior outcome. Only some institutional mechanism that shields monetary policy from politics can stabilize prices. One that is frequently discussed is independence of the central bank, which has been found empirically to correlate with lower inflation rates.4

The second view associates high inflation with political fragmentation. The main idea is that monetary stability is a public good. If it is provided for one user of the currency, it is provided for all (nonexcludability), and one person's enjoyment of low inflation does not

³ A third set of models are not addressed here because their implications for decentralization are less clear. They attribute sub-optimally high inflation to asymmetric information and the competition among social actors to avoid bearing the costs of stabilization. The classic example is Alesina and Drazen 1991.

⁴ See Aleuna and Summers 1993; Cukierman 1992, Cukierman, Webb, and Neyapti 1991. Cukierman finds that in developed countries legal independence of the central bank is associated with lower inflation. In developing countries, legal independence appears to differ from actual independence, as proxied by a low frequency in turnover of the bank's governor. It is actual independence that significantly correlates with inflation.

diminish that of another (nonrivalness). How much monetary stability is provided depends on the extent to which each party with control over fiscal and monetary policy agrees to "contribute" by restraining its demands for increased public spending and newly created money.⁵ Public goods tend to be underprovided if the number of consumers is large and no single actor has an "encompassing interest" in providing them (Olson 1965). Weakening the central government's stake in lower inflation and increasing the number of other actors with leverage over policy should, by this logic, reduce the "amount" of price stability provided.

Empirically, there is some support for the view that too many fiscal cooks spoil the macroeconomic broth. Among OECD countries, those with more fragmented party systems and coalition governments tend to have higher public sector budget deficits (Grilli, Masciandaro, and Tabellini 1991; Roubini and Sachs 1989). Some scholars suggest that ethnic fragmentation also may reduce public good provision, inhibit financial system development, or have other undesirable economic consequences (Alesina, Baqir, and Easterly 1997; Easterly and Levine 1997). The argument in this work has been that political fragmentation increases the pressures on central policymakers to overprovide fiscal benefits and underprovide the public good of price stability.

These two perspectives have opposite implications for how political or fiscal decentralization should affect inflation. If inflation is caused by an inability of the central government to commit credibly to stable fiscal and monetary policies, then the subdivision of power may help. The checks and balances of a federal system may make it harder for central policymakers to renege on commitments, that is, boost deficit spending before elections or pressure the central bank to ease interest rates. At times, the autonomy of organizations (such as the central bank) can be enhanced by dividing authority over them among competing actors with conflicting interests, which hampers the ability of any one of them to dictate policy (Moser 1997; Persson, Roland, and Tabellini 1997). Dividing power over the central bank between central and subnational governments may strengthen the bank's ability to resist political pressures and increase the credibility of its monetary policy.

Lohmann (1998) argues that exactly such a decentralization helps explain Germany's low inflation in the postwar period. The independence of the Bundesbank was enhanced by the way it was embedded into the country's federal institutions. A majority of the bank's council members were appointed by the Land governments. Central and Land elections were staggered, and the parties dominating governments at the two levels often differed. The Lander were also represented in the Bundesrat, the upper house of parliament, which could veto changes to central banking legislation. These factors served to check attempts by central government to inflate the economy in order to buy popularity during electoral campaigns. Germany's inflation in this

period was among the lowest in Europe. Along these lines, Wildasin (1996, 324) argues that in South Africa "strengthening provincial and local institutions may create a credible institutional constraint on the exercise of the redistributive powers of the public sector."

If inflation results from a collective action problem, however, then the subdivision of power should make the situation worse. Increasing the number of (central and subnational) actors with influence over fiscal or monetary policy should exacerbate the collective action problem in the same way that increasing the number of parties in government or ethnic groups lobbying for benefits is thought to do. The central government is the only actor with an encompassing interest in price stability. Subnational governments have far less reason for restraint: The costs of inflationary spending are spread across all regions, but the benefits can be targeted to their constituents.6 Forcing the center to share power with partly autonomous subnational governments means that actors with more inflationary preferences are given a stronger say.7

In essence, these two arguments differ over the source of inflationary pressure. The commitment view places it with the central government. Because boosting the money supply is its dominant strategy, the central government prefers to inflate. The collective action view attributes the inflation motive to regional governments, which benefit from particularistic central spending programs whose costs are shared with other regions. Shifting the balance of power between central and regional governments will have opposite results depending on which of these assumptions about preferences is right. Of course, both may be correct, in which case decentralization will not have much effect on the inflation rate. And each may be correct in different settings, in which case the effect of decentralization is context dependent.

A more recent theory suggests a third type of relationship between political decentralization and inflation. Tsebelis (1995, 1999, n.d.) argues that major changes in central government policies will be rarer when the number of veto players—collective or individual decision makers whose agreement is necessary for a change in the status quo—is greater.8 Federal constitutions are a deliberate way to increase the number of veto players. They may provide subnational governments with the right to veto certain central policies within their jurisdiction and/or formal rights in central decision making, and they sometimes establish the courts as arbiter between levels of government, or chief veto player. Therefore greater continuity in monetary and fiscal policies—and in the relative inflation rates they generate, whether high or low-may be

⁵ For an application of this argument to China, see Huang 1996, chap. 9.

Weingast, Shepale, and Johnson (1981) show, in a similar vein, why the representatives of geographical constituencies in a legislature often favor excessive spending.

⁷ According to the World Bank (1997, 124): "Because decentralization increases the number of actors and of budgetary accounts, countries facing serious budgetary and inflationary pressures will be confronted with additional challenges and risks."

⁸ Franzese (1998) finds greater continuity in deficit and debt patterns in OECD countries that have a larger number of veto players.

expected in federal than in unitary states. In a sense, the commitment of the government to current policy is rendered more credible in this theory, but unlike the commitment view, no association is assumed between commitment and fiscally responsible policy. Bad policies are made more "sticky," too.9

Various contextual factors are thought to influence the way all three models work and complicate their implications for decentralization. Arguments, and in some cases empirical evidence, suggest that inflation rates may be affected by the level of economic development, political instability, import penetration, the exchange rate system, the political strength of the financial community, and the nature of the political regime (democratic or authoritarian). In the empirical analysis, I include indicators of these in a set of controls.¹⁰

The commitment, collective action, and continuity theories all appear to be based on valid logic, but their implications conflict. The more political power is shared among levels of government, the weaker will be the central government's capacity to inflate the economy unilaterally (the commitment argument); the weaker will be the government's ability to change the arrangements by which monetary and fiscal policy are determined, whether or not they are inflationary (the continuity argument); but the greater will be the capacity of subnational governments to press for inflationary central aid (the collective action argument).

When theories conflict, the most useful way forward is often an empirical approach. Should policymakers in inflation-prone countries decentralize political power and fiscal responsibility in the hope of insulating monetary policy? Or should they centralize power in order to avoid collective action problems in macroeconomic stabilization? Does the most auspicious strategy depend on whether they start from high or low inflation? To answer these questions, we need to know more about which logic predominates in particular settings. I turn now to an investigation of the actual patterns of

inflation in a broad selection of countries in the 1970s and 1980s.

EMPIRICAL ANALYSIS: DECENTRALIZATION AND INFLATION

Which of the various possible relationships between decentralization and inflation holds in practice? I analyzed average inflation rates of the Consumer Price Index (CPI) in 87 countries for four five-year periods in the 1970s and 1980s.11 The dependent variable is the log of average inflation over the five-year period, taken from the International Monetary Fund's (IMF) International Financial Statistics Yearbook, various years. The log is used, as in numerous other studies, to avoid giving excessive weight to observations of extremely high inflation; hyperinflation is widely thought to be generated by a nonlinear process. Averaging over five years also reduces the influence of episodic high inflation and seems appropriate since many of the independent variables change relatively slowly or are only available as multiyear averages (e.g., the indicators of central bank independence). The sample includes all countries for which data are available for the main independent variables.

The estimation strategy is least squares with dummy variables.12 Wherever possible, I use panel-corrected standard errors (pcse's) as recommended by Beck and Katz (1995) to correct for panel heteroskedasticity and contemporaneous correlation of the errors. In some cases, gaps in the data made it impossible to compute pcse's. In such cases, I corrected for panel heteroskedasticity and modeled the expected contemporaneous correlation directly by controlling for the average value of the dependent variable in all other countries (lagged one period to reduce problems of endogeneity). 13 To correct for serial correlation, I included a lagged value of the dependent variable, as recommended by Beck and Katz (1996).14 In each regression, I include three dummy variables for period (1975-79, 1980-84, 1985-89; the excluded category is 1970–74) and five dummy variables for region (Asia, Latin America and the Caribbean, sub-Saharan Africa, the Middle East and North Africa, Eastern Europe and the former Soviet Union; the excluded category is Western Europe and North America). I also experimented using different regional groupings to check that this did not affect the main results.15

Political decentralization is not the only way to increase the number of veto players: Various other constitutional devices may entrench the power of competing institutional actors. Also, the political fragmentation created by decentralization may be overcome in some cases by a cohesive, nationwide party that aligns the interests of actors in different power centers. Thus, one would expect a correlation but not a perfect correspondence of political decentralization with more veto players.

¹⁰ Some work suggests that inflation and other macroeconomic outcomes also may be related to a country's budget process and institutions. Various scholars believe that when the budget is formed by numerous spending agencies or levels of government submitting bids, which are then aggregated, fiscal discipline tends to be weaker than when the budget parameters are set by a central actor and then disaggregated downward (Alexina et al. 1996, Von Hagen and Harden 1996). No comprehensive indicator of cross-national differences in budget process is available, so I was unable to control for such differences systematically. A recent study provides comparative indicators for 20 countries in Latin America and the Caribbean (Alesina et al. 1996). It rates the relative power of finance ministries over other ministries in preparing the budget, parliament's authority to amend the budget, whether government regularly assumes the debt of public agencies, and whether state and local governments can borrow domestically without central restrictions. None of these correlates with federal structure.

¹¹ The choice of period was dictated by data considerations. Reasonably comprehensive information on central and local budgets is only available from the early 1970s onward.

¹² For a discussion of the technique, see Stimson 1985. The fixed effects for which I control are not for individual countries but for regions and periods.

¹³ I am grateful to Robert Franzese for suggesting this technique.
¹⁴ The analysis was done using STATA, with the xtpcse option. Beck and Katz (1995, 1996) show with Monte Carlo experiments that ordinary least squares (OLS) with panel-corrected standard errors, including a lagged dependent variable to correct for serial correlation, is generally preferable to either the Parks generalized least squares or Kmenta's approach to analyzing time-series cross-section data sets.

¹⁵ In particular, I tried using instead the IMF classification of

As a preliminary check, I first tried to replicate in this data set the results of various works on the causes of inflation. Different authors find evidence that inflation is reduced by greater central bank independence (Alesina and Summers 1993; Cukierman 1992; Cukierman, Webb, and Neyapti 1992), higher exposure to imports (Romer 1993), and pegged exchange rates (Ghosh et al. 1995; Giavazzi and Pagano 1988) and is increased by political instability (Cukierman, Edwards, and Tabellini 1992; Cukierman and Webb 1995; Edwards and Tabellini 1991).

Regressing log inflation on the region and period dummies along with a measure of each of these, I was able to replicate three of these findings (at least in regressions that did not include other controls). First, using the indices of Cukierman, Webb, and Neyapti (1992), I confirmed their finding that central bank independence is linked to lower inflation.16 Their indicator for the practical independence of central banks infrequent turnover of the bank's chief executive—is significantly associated with lower inflation (at p <.01).17 Second, I replicated the Ghosh et al. (1995) finding that countries with pegged exchange rates tend to have lower inflation than those with floating rates.¹⁸ Third, I found some limited support for the claim that inflation is higher in more politically unstable countries. I tested three indicators of political instability: (1) whether the country underwent a war with an external power during the decade, (2) whether it underwent a civil war, and (3) the number of revolutions or coups during the decade. 19 No indicator was significant in the complete sample, but civil war was significantly associated with higher inflation among the OECD countries.20 I did not find significant evidence that inflation was lower in countries with a higher share of imports in GNP; the coefficient was negative as expected, but the p level was only .16. This may, of course, be because the regression lacked appropriate controls.

I also tested for evidence in support of two other hypotheses. Posen (1995) and Cukierman (1992) argue that the strength of the financial sector should correlate with lower inflation because banking interests lobby for conservative monetary policy. I used two

countries. This grouped all industrialized nations together and grouped developing countries by location in Asia, Africa, Europe, the Middle East, and the Western Hemisphere. When this yields slightly different results, I so indicate in footnotes.

¹⁶ Since the indices of central bank independence are calculated only by decade, I use the same values for the two halves of each decade.
¹⁷ I did not find their indicator of the *legal* independence of central banks significant in any regression.

¹⁸ The variable I construct from their annual ratings takes the value of 3 for a pegged exchange rate system, 2 for an intermediate system, and 1 for a floating system. I use the average annual rating for the given five-year period. This variable may well be endogenous, so the question can still be raised whether pegged exchange rates reduce inflation, or high inflation prompts the adoption of pegged exchange rates.

¹⁹ The revolution or coup variable is the main one used to measure political instability in Barro 1991. All variables were taken from Easterly and Levine 1997. Data for war and civil war were compiled by Sivard (1993); the coups and revolutions variables were compiled by Banks (1994).

²⁰ This is entirely attributable to the high inflation of Turkey, which experienced civil war in the 1970s and 1980s

indicators of banking sector development employed in previous studies: total claims of deposit banks as a share of GDP and total claims of deposit banks on the private sector as a share of GDP (Demirgüç-Kunt and Levine 1995; Levine and Zervos 1996).²¹ I found that banking sector development is significantly correlated with lower inflation, using either indicator. The effect loses significance, however, if one controls for GDP per capita, so it is not entirely clear whether banking sector development or some other aspect of economic development leads to lower inflation rates.²²

In recent decades scholars have debated whether the type of political regime, democratic or authoritarian, affects the government's ability to control inflation. Some suggest that democracies are more vulnerable to popular pressures for inflationary government spending (e.g., Skidmore 1977), whereas authoritarian regimes are able to repress social forces in the interest of financial stability (e.g., Haggard and Kaufman 1992; O'Donnell 1973). Significant doubts—both theoretical and empirical—have been raised about the latter argument (e.g., Geddes 1995), but it seemed worthwhile to test whether democracies tend to have higher inflation rates than other regimes. I used as a measure the number of years in the relevant five-year period that the country was democratic.23 Democratic government turns out to be significantly related to higher inflation, controlling for economic development.

To test for the effects of political and fiscal decentralization, I used three admittedly imperfect indicators. The first is whether the state is classified by scholars as federal. I relied on Elazar (1995), but because my data end in 1989 I do not count as federal either Belgium or Spain, which some experts consider federal only in the 1990s. Political scientists debate the finer points of a definition of federalism, but there is basic agreement on the primary characteristic: a constitutionally guaranteed division of power between central and regional governments (see, e.g., Lijphart 1984, 170). In Riker's (1964, 11) formulation, a federal constitution has (at least) two levels of government for the same land and people; each level has "at least one area of action in which it is autonomous"; and this autonomy must be guaranteed in the constitution.²⁴

²¹ I chose the figure as of 1970 so as to minimize the danger of reverse causation—high inflation reducing the size of bank deposits. The variables were lines 22a-d and 22d, respectively, from IMF International Financial Statistics Yearbook, 1987.

²² The effect is also insignificant if the IMF's regional classifications—which group all industrialized countries together—are used for the regional dummies. Posen (1995) conjectures that federal states tend to have more developed banking sectors. This turns out to be true within the OECD. Among non-OECD states, however, the relationship between banking sector development and federal structure is negative (although not significant).

²³ The classifications were those of Alvarez et al. (1996).

²⁴ Obviously, constitutional guarantees are not always observed, so a constitutionally defined indicator of decentralization needs to be supplemented by alternative measures (such as the fiscal ones I also use) and the results checked for robustness.

Note: The dependent variable is the log average annual change in the CPI for successive five-year periods. Estimation is by least squares durminy variables; panel-corrected standard errors are in parentheses (adjusted for heteroskedastiotty and contemporaneous correlation). p < .05, p < .01, p < .00. For data sources, see the Appendix. To calculate panels for regressions in models 4, 5, and 6 it was necessary to exclude cases for which there were fewer than two observations available. For subsequent and/or previous period N varies across models because of gaps in the data for some variables. Each regression also includes durmines for period and for region (Asia, Latin American and Caribbean, sub-Seharan Africa, Middle East and North Africa, Eastern Europe and the former Soviet Union; the excluded outegory is Western Europe and North America). Coefficients on these (not reported) are available from the author upon request.

This is the definition I use.²⁵ It fits with Elazar's (1995) classification of countries.

The second and third indicators are the share of subnational governments in total government spending (compiled mostly from the IMF Yearbook, data taken as close to the midpoint of the five-year period as possible) and in total tax revenues. These fiscal variables have the advantage of being continuous, compared to the dichotomous federal structure dummy. All three variables are quite highly correlated in the country-years for which data are available (the two fiscal variables with each other at .90, both with federal status at .59).

Table 1 shows the regression of log inflation on federal status, subnational spending share, and subnational tax share for the full sample of country/periods.

All regressions include the already mentioned regional and period dummy variables as well as a one-period lag of log inflation. In each case, I show two models; one includes a set of controls based on the studies discussed above, and one does not.²⁶ None of the decentralization variables have noticeable effects, with coefficients close to zero. Based on this alone, it may seem that political or fiscal decentralization has little to do with inflation.

In Table 2 are test results for the third theory, that decentralization is not associated with either high or low inflation per se, but with greater continuity in either because of the perpetuation of policy and institutions. In other words, federal states with relatively low or high inflation are more likely than similar unitary states to remain in that condition, whereas unitary states with low inflation are more likely than

²⁵ Both India and Pakustan classify as federations under this definition. Article 26 of India's constitution stipulates that states have an exclusive right to legislate on any of a list of areas, including the state courts and local governments. Pakistan's constitution (Article 142) gives provincial assemblies exclusive authority to make laws on any matter not covered by two lists included in the constitution.

²⁶ Log per-capita GDP should capture in part the greater dependence of less developed countries on seignorage (the profit to the state from money creation) because they lack effective tax collection systems.

Note The dependent variable is the log average annual change in the CPI for successive five-year periods. Estimation le by least squares dummy variables; panel-corrected standard errors are in parentheses (adjusted for heteroekedastion) and contemporaneous correlation) p < .05, p < .01, p < .00. The data sources, see the Appendix. To calculate pose's for regressions in models 5 and 8 it was necessary to exclude cases for which there were fewer than two observations available. For submational tax share data, figures were also interpolated when data were available for subsequent end/or previous period. N varies across models because of gaps in the data for some variables. Each regression also includes dummies for period and for region (Asia, Latin American and Caribbean, sub-Saharan Africa, Middle East and North Africa, Eastern Europe and the former Soviet Union; the excluded category is Western Europe and North America). Coefficients on these (not reported) are available from the author upon request.

similar federal states to let the rate slide upward, and unitary states with high inflation are likelier than similar federal states to stabilize successfully. To test this, I include in the regressions in models 1 and 2 a term for federal structure and an interaction term for federal structure and log inflation in the previous period. (As before, I also control for the log of average inflation in the previous period.) If federal structure increases the continuity of either relatively low or relatively high inflation, then the interaction term should have a positive coefficient, and the coefficient on the federal dummy should be negative. If so, this means that inflation for a federal state (I_{tV}) , given low levels of

previous inflation, but higher than inflation for a unitary state, given high levels of previous inflation.

The reason is easy to demonstrate formally. Inflation is modeled as an exponential growth process. For federal states: $I_{tF} = a_p I_{(t-1)F}^{\ \ \ \ \ \ \ \ }^{bF} + [\text{other factors}]c$; for unitary states: $I_{tU} = a_U I_{(t-1)U}^{\ \ \ \ \ \ \ \ \ \ }^{bU} + [\text{other factors}]c$ (a_F represents the coefficient and bF the exponent on previous inflation for federal states; a_u and bU are the corresponding coefficient and exponent for unitary states; c is a vector of coefficients on other factors). My hypothesis is that at low levels of I_{t-1} , $I_{tF} < I_{tU}$, but at high levels of I_{t-1} , $I_{tF} > I_{tU}$. This will be the case if two hypotheses are both true: H1, bF > bU; H2, $a_F < a_U$. The equation estimated statistically is the following:

 $\log(I_t) = \alpha + \beta_1 \text{federal} + \beta_2 \log(I_{t-1}) + \beta_3 [\text{federal} \times \log(I_{t-1})] + [\text{controls}] \gamma + \epsilon_r$ From the estimates, we can derive: $a_F = 10^{(\alpha + \beta_1)}$; $a_U = 10^{\alpha}$; $bF = \beta_2 + \beta_3$; $bU = \beta_2$. H1 can be rewritten as $\beta_2 + \beta_3 > \beta_2$, or $\beta_3 > 0$; and H2 yields: $10^{(\alpha + \beta_1)} < 10^{\alpha}$, or $\alpha + \beta_1 < \alpha$ and $\beta_1 < 0$. This proved to be the case. Both the interaction term and the federal structure dummy are significant, or very close to significant, with the expected signs, whether or not the controls are included. The other columns of Table 2 show that this relationship also holds when subnational expenditure or tax share is used as the indicator of decentralization.

These findings provide some strong support for the continuity hypothesis. In general, average inflation rates tended to rise during the 1970s and 1980s in both unitary and federal states. Although there was a general upward drift, the rise was less in federations with low inflation in the previous period compared to similar unitary states, and the rise was greater in federations that started from high inflation compared to similar unitary states. The regression suggests a cutoff point around 7.5%. Federations with inflation higher than this five years earlier tended to have a faster rise than similar unitary states, and those with inflation lower than 7.5% five years earlier tended to have a slower rise than similar unitary states.²⁹ Figure 1 graphs this estimated relationship.

Another way to make the same point is to consider the correlations between current and earlier inflation. Among unitary states, the correlation is a respectable .55. Among federal states, it is .82. There is also a far tighter relationship in federal states between average inflation rates across long periods. The correlation between the log of average inflation in 1985–89 and in 1955–59 is .58 for unitary states but .93 for federations. The relationships are shown in Figure 2A and B.

I performed some additional checks in order to be sure that the results were not sensitive to the coding of certain countries on the federal dummy. For instance, some federations in the developing world are less politically decentralized than others. In India, Pakistan, Venezuela, Nigeria, and former Yugoslavia, state governors are appointed by the center rather than elected or selected locally. In Malaysia, some state governors are federally appointed and others inherit the office. I excluded these cases from the sample (both with and without Malaysia) and ran the regressions in Table 2

The estimates imply that a unitary state with milation above about 45% will on average see inflation decrease in the following period at milation (I_{t-1}) of 45%, the estimates from Table 2, model 1, with decentralization set at zero, imply that $I_t = I_{t-1}$. The estimates for federal states (without controls) suggest a tendency for inflation to increase on average from all starting points above zero.

(both with and without the controls). The results were very similar and often stronger than those reported in the table.³⁰

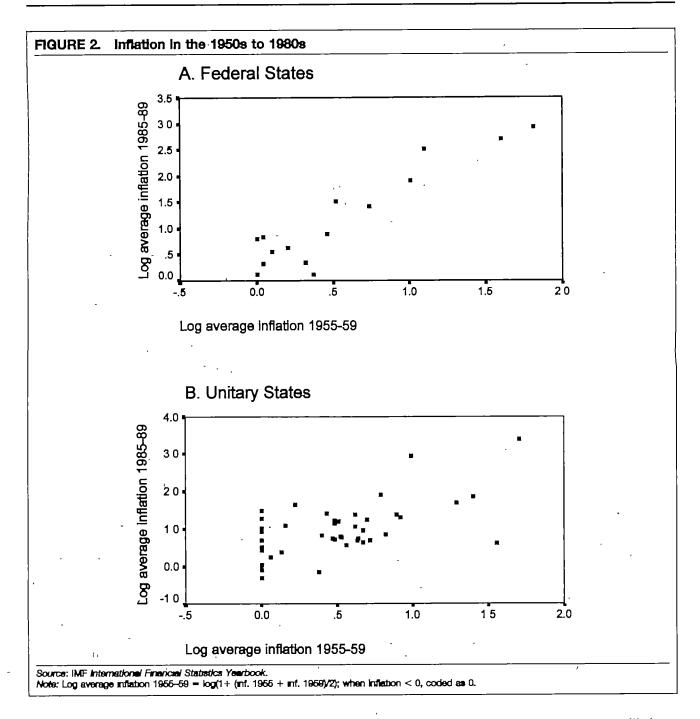

Since the rest of the article focuses on this result, it is worth repeating that it holds regardless of which of these three measures of political or fiscal decentralization is used. Each is imperfect in its own way. Coverage for the fiscal variables is much poorer, and the data may contain considerable measurement error. Furthermore, states that call themselves "federal" are not by any means equally decentralized politically. The fact that the same result appears regardless of indicator adds some confidence in the finding. In most of the analysis below, I use federal status as the primary decentralization indicator, since that information is available for a far larger number of cases than data on either of the fiscal variables, but where relevant I also use the other indicators.

²⁷ The estimated relationship for unitary states: $Log(I_t) = .71Log(I_{t-1}) + .48$, which yields $I_t = 3.02I_{t-1}^{-71}$. For federal states it is: $Log(I_t) = 1.03Log(I_{t-1}) + .20$, which yields $I_t = 1.58I_{t-1}^{-1.03}$.

²⁸ Including the controls, the federal dummy just misses the conventional .05 level of significance (p < 06).

²⁹ The 7.5% cutoff is implied by the estimated regression coefficients not including controls. Controlling for log per-capita GDP, central bank independence, openness to imports, exchange rate system, political instability, size of the banking sector, and democracy, the cutoff is around 10%. Obviously, these should be taken as only approximate estimates.

³⁰ One reviewer wondered whether the results might be influenced by the coding of India, Pakistan, and Germany as federal. He considers these far more centralized than "federal" suggests. I ran the regressions in Table 2 (using both, the dichotomous federal dummy and the continuous fiscal variables, both with and without controls) excluding Germany, Pakistan, and India. The results were virtually identical.

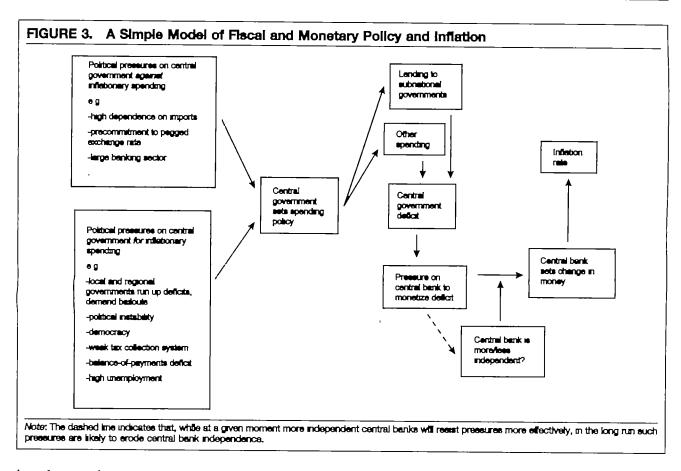

TRACING THE MECHANISMS

What does political decentralization perpetuate? What explains the persistently high inflation in some federal states (Argentina, Brazil, Mexico, Nigeria, and Yugoslavia) and the persistently low inflation in others (Austria, Canada, Germany, Malaysia, Switzerland, and the United States)? To answer this question, I proceed in two stages. First, I sketch a very simple model of how particular economic and political conditions as well as fiscal and monetary policies translate into inflationary outcomes. I show that the relationships assumed by this model are consistent with the evidence available in this data set. Second, I explore what elements in this policy process model are more persistent in federal than in unitary states. That con-

stancy may explain why inflation rates are likely to remain either relatively high or relatively low in federations over long periods.

Figure 3 outlines a simplified model of the causes of inflation. No claims for originality or completeness are made; the goal is merely to distill some of the important relationships assumed in the economics and political science literature. First, various economic and political conditions create pressures on the central government to indulge—or not indulge—in deficit spending. For example, strong regional and local governments that run up deficits and demand bailouts are one source. Political instability may prompt central politicians to spend unsustainably in the hope of retaining office. Some argue that the need to attract votes

in a democratic system may encourage incumbents to inflate the economy. By contrast, import dependence is a source of inflationary restraint, as spending might depreciate the currency and drive up import prices. Also, if a central government commits to keeping inflation low, perhaps by announcing a pegged exchange rate, the desire to maintain credibility is an incentive not to renege. Large and politically powerful financial sectors are also likely to lobby for financial stability.

These various pressures affect the fiscal policy choices of central government. They help determine how much the government spends, what proportion of the budget is devoted to lending (e.g., bailouts for subnational governments), and the size of the deficit. The larger the national deficit, the greater is the pressure from government on the central bank, ceteris paribus, to finance it through money creation. The degree of independence of the central bank will determine its resistance to increasing the money supply, which in turn affects the inflation rate.

Many other sources of pressure and possible links are excluded from this simplified outline. Furthermore, isolating the importance of particular links in the causal chain is extremely difficult (both theoretically and empirically), since each actor is strategic and makes choices based on expectations about how others will act at other points. Keeping these caveats in mind, the model provides a framework for exploring inflation performance in federal states.

In the following section, I seek empirical confirmation of the links in the model. Do the hypothesized pressures encourage central government spending, lending, and deficits? Does this lead, when central bank independence is sufficiently low, to an increase in the money supply? Does that lead, as the quantity theory of money predicts, to rising inflation? The empirical confirmation is partial, since data are not available for some variables in enough periods to permit causal modeling.³¹ Instead, I will only test for the predicted controlled correlations with time-series cross-section regressions, as before. Inferences about the direction of causation must be tentative.

Then I will test whether the greater policy continuity in federal compared to unitary states remains as one pursues the data backward along the modeled causal chain. Does federal status lock in particular monetary policies, the degree of central bank independence, the size of national deficits, the central government's level of spending and net lending, or specific political and economic pressures on central governments to spend more or less?

The Sources of Inflation

To assess how well the model depicted in Figure 3 fits the evidence in this data set, I ran a series of regres-

⁵¹ For instance, the Cukierman, Webb, and Neyapti (1992) measures of central bank independence are only available for (roughly) ten-year periods. Even using such data, Cukierman (1992) finds evidence of Granger causality running both from high central bank independence to lower inflation and from higher inflation to lower central bank independence. It was not realistic to attempt aimilar causal modeling here since data on the key fiscal variables are available only since 1970, which permits the use of only two of Cukierman's decade indicators of central bank independence.

sions to estimate the effect of each "upstream" variable (economic or political conditions, fiscal or monetary policies) on "downstream" variables (e.g., the inflation rate). The goal was to trace the hypothesized causal chain backward, from inflation rates to the monetary and fiscal policies believed to generate them. In each case, I controlled for all variables assumed to cause the explanatory variable in question, but not for those assumed to be caused by it. (For example, I control for central expenditure in a regression to assess the contribution of money growth to inflation, but not for money growth when estimating the effect on inflation of central expenditure levels.) Thus, the coefficients should be interpreted as estimating the additional contribution of the key explanatory variable in determining the dependent variable. In all cases, the "causally prior" control variables are those previously used: the share of imports in GDP, the exchange rate system, civil wars, revolutions or coups, log per-capita GDP, the size of the banking sector, and democracy. Each regression also includes region and period dummies as well as a one-period lag of the dependent variable.³²

The results, shown in Table 3, provide clear evidence for most of the links in the model. The first nine columns trace the causes of inflation backward along the hypothesized chain. (In each regression, the key explanatory variables are in boldface, to distinguish them from the causally prior controls.) First, I confirmed the quantity theory of money in this data set (column 1). Even controlling for central bank independence, central and subnational deficits, central spending, and the share of net lending in central outlays, higher money growth is very significantly related to a faster rise in inflation (coefficient of .65, significant at p < .01).³³ (Since the dependent variable is inflation controlled for its previous level, it makes sense to interpret this as a measure of the increase in the average inflation rate.) Second, as already replicated in an earlier section, the frequency of turnover of central bank chief executives (indicating lower independence of the central bank in practice) is positively associated with a faster rise in inflation (column 2).34

Are large national deficits associated with higher inflation? The estimated coefficient (.004), while positive as predicted, is not significant. Experimentation with an interaction term clarifies the relationship (see column 4). A large deficit when the central bank is very independent is not necessarily inflationary, but when the bank has little independence (i.e., frequent turn-

over of chief executive), a large deficit is significantly associated with a faster rise in inflation.³⁵ The politically weak bank cannot resist the government's pressure to increase the money supply.

Central governments that devote a large share of outlays to net lending tend to experience significantly larger jumps in inflation (column 5: coefficient of .02, significant at p < .01). Central governments with higher spending as a percentage of GDP tend to have larger deficits (column 11: coefficient of .24, significant at p < .01). When the central bank is less independent, higher central spending is strongly associated with a rapid rise in inflation (column 7: coefficient of .015 on interaction term), but this is not the case when the bank is more independent. Finally, larger subnational deficits are accompanied by greater increases in central government expenditure (column 14); an additional 1% of GDP in subnational budget deficits is associated on average with central government layouts about 1.65% of GDP higher.36 If the central government devotes significant resources to lending, sizable subnational deficits also lead to larger increases in the national deficit (column 13: coefficient of .10 on interaction term).37 When the central bank is less independent, subnational deficits also are associated with higher inflation (column 9: coefficient of .83 on interaction term).

The evidence in Table 3 suggests a plausible account of how inflation rates are determined. Fiscal pressures percolate upward through the system as expected; subnational deficits stimulate central spending, lending (presumably, in part, for bailouts), and deficits, which in turn stimulate money growth and inflation. These effects are moderated—and perhaps can even be eliminated—by a central bank that is in practice independent of government. Whether or not subnational deficits lead to central government deficits appears to depend on the extent to which the central government is in the business of extending loans.

This is a picture painted with broad strokes. The use of five-year averages limits the ability of regressions to fill in finer details, which remain to be explored with annual data, different specifications of the variables, and different lag structures. My goal is not to test each hypothesis as conclusively as possible but merely to establish empirical support for a model with which to explore the effects of political decentralization.

Two intriguing questions are left for future study. First, an independent central bank appears to act as a

³² Ideally, the regressions would also have controlled for unemployment, balance of payments, and quality of the tax collection system. Difficulties collecting systematically comparable data precluded this, however. Per-capita GDP should correlate with more effective tax collection and is included partly for that reason. Because neither unemployment nor the balance of payments is likely to correlate with decentralization, the results will not be biased.

^{33 &}quot;Money" here is demand deposits plus currency outside banks.
34 In this case, I am controlling for central and subnational deficits, central spending, and net lending share. It is possible that low central bank independence is not the cause of inflation but an effect of fiscal pressures that are themselves the true cause of high inflation (i.e., the dashed arrow in Figure 3). Yet, the significant negative relationship between central bank independence and inflation in Table 3 when indicators of such fiscal pressures are controlled suggests that central bank independence probably does have some direct effect.

³³ The significance of the interaction terms of fiscal variables with central bank independence also suggests that the influence of central bank independence on inflation will vary with the fiscal context (and underlying political factors). A given level of bank independence has a greater inflation-reducing effect when fiscal and political pressures to spend are weak. This point is demonstrated convincingly in Franzese 1999.

³⁶ Fornasari, Webb, and Zou (1998), analyzing annual data for 32 countries in the 1980s and early 90s, also find a significant relationship between subnational deficits and higher central government expenditures.

⁵⁷ Fornasari, Webb, and Zou (1998) find a significant relationship between subnational and central deficits and that this effect is larger in countries with less independent central banks.

Note: All regressions include the region and period durinties, a one-period lag of the dependent variable, and the following controle; log GDP per capita, pegged exchange rate, importa/GDP, cwil wer, revolutions or coups, acts of the native which is a defendent variable of the operation of the variable of the contract variable of the variable of variab

circuit breaker between fiscal pressures and inflation, but we do not know for sure what causes practical independence to be higher in some countries than others. Greater legal independence of the central bank is clearly not sufficient; in the Cukierman, Webb, and Neyapti (1992) study indexes of practical and legal independence of central banks are not positively correlated (r = .02), whether or not one controls for log per-capita GDP). A complete answer requires much additional research, but this data set offers some clues about where to look. As suggested in previous work, political instability is likely to undermine the bank's independence (Cukierman and Webb 1995), as is a large outstanding domestic currency debt, which the central government will seek to devalue by pressing the bank to inflate the currency. Fiscal pressures—and the inflation they stimulate—may themselves over time erode the bank's independence.38

As a preliminary test of these hypotheses, I regressed the Cukierman, Webb, and Neyapti (1992) index of the frequency of central bank executive turnover (decade averages for the 1960s through 1980s) on regional and period dummies, lagged executive turnover, legal central bank independence, log average inflation rates lagged one decade (as recommended by Cukierman 1992), revolutions or coups, civil war, and the domestic debt of central government as a percentage of GDP at the beginning of the decade. The results, presented in Table 4, strongly support the conjecture that political instability reduces central bank practical independence (the more revolutions or coups occur, the greater is the turnover of central bank governors) and weakly support the notion that governments with a large domestic currency debt are more likely to pressure the central bank to inflate it away (the coefficient is positive, as predicted, but only significant if one does not control for per-capita GDP). There is little evidence that inflation ten years earlier undermines central bank independence, although there might be a stronger effect with a different lag structure. I was able to reproduce Cukierman's (1992, chap. 20) finding that lagged inflation is related to central bank governor turnover when controls are not included, but the significance of the effect falls when region and period dummies are included and when other controls are added.

The second intriguing question is why different governments devote different shares of total outlays to net lending. When governments lend more, subnational deficits appear to get pushed upward, eroding central budget balance and worsening inflation. Central governments' lending share thus serves as a kind of proxy for soft budget constraints. But what causes this? Why, for instance, did Brazil and Egypt devote more than 10% of outlays to net lending in 1987, whereas Mexico and Romania had a net lending balance of almost zero? We do not yet know, although the literature offers plausible conjectures. More cohesive national parties may give central politicians greater leverage over regional officials demanding loans (Ordeshook 1996; Riker 1964), as may a constitution in which central government has the right to dismiss regional officials.³⁹ Interregional inequality may influence the strength of pressures on the central government to extend loans to poorer regions. Data are not available to test such propositions at this point, but that is a priority for future work.

What Does Federal Structure Perpetuate?

If the model of the causes of inflation sketched above accords with the evidence, then what aspect of the process does federal structure make more durable? Political decentralization may induce stickiness at several points. It may lock in either a high or low level of central bank independence by increasing the number of veto players who can block changes in the system of appointing bank members or the statutory definition of its role. It may increase intertemporal continuity in the size of central or subnational deficits by making it difficult to change status quo spending levels. It may lock in the level of central government lending, which in this data set seems to be a proxy for the readiness to bail out subnational units. Finally, it may lock in a particular level of exposure to imports or some other economic or political determinant of inflation.

To test each of these hypotheses, I ran a series of regressions of the following form: $\Delta X_t = \alpha + \beta_1 X_{t-1}$ + β_2 Federal + β_3 (Federal $\times X_{t-1}$) + $\beta_4(\Delta X)_{t-1}$ + β_5 regional dummies + ε_r . For each possible determinant of inflation, X, I regressed the change in that variable since the last period, ΔX_p on the lagged value of that variable, X_{t-1} , expressed as the deviation from the mean. I included an interaction term for federal structure and the lagged value of the main variable, Federal $\times X_{t-1}$, as well as the federal dummy and the region dummies. To correct for serial correlation, I included a one-period lag of the change in the main variable, $(\Delta X)_{t-1}$. As before, I used panel-corrected standard errors where possible, and where not I modeled the expected contemporaneous correlation directly and corrected for panel heteroskedasticity. The results are given in Table 5.

If the variable in question adjusts after a shock by regressing toward the mean, one would expect a negative coefficient on the lag of the policy variable in these regressions. Because this variable is expressed as the deviation from the mean, it will be negative when relatively low and positive when relatively high. A negative coefficient on the lagged policy variable means that the adjustment will be upward if the variable is relatively low (a negative coefficient times a negative variable produces a positive change), but downward if the variable is relatively high (a negative coefficient times a positive variable produces a negative change). The larger the size of the negative coefficient the faster will be the adjustment. The interaction term is included to test whether adjustment is significantly different in federal than in unitary states. If the variable adjusts more slowly—i.e., is stickier—in federal than in unitary states, one would expect a significant positive coefficient

³⁶ These hypotheses are found in Cukierman 1992.

³⁹ Dillinger and Webb (1998) see this as an important difference between Argentina and Brazil.

on the interaction term. That is, the positive coefficient on the interaction term when added to the negative coefficient on the lagged policy variable will reduce its size and slow down the pace of adjustment.

Of the seven variables examined in Table 5, two fit the pattern—a significant negative coefficient on the lagged value of the variable and a significant positive coefficient on the interaction with federal structure. These two variables adjust more slowly in federal states than in unitary ones.

First, the degree of practical central bank independence is stickier in federal than in unitary states (Table 5, column 1). (For this regression, I used the Cukierman, Webb, and Neyapti [1992] decade data going back to the 1950s.) In a unitary state with a high turnover rate for the central bank governor-perhaps one per year, or 1.0 on the Cukierman, Webb, and Neyapti index, above the mean—this rate would drop by the next decade, other things equal, to about .39 above the mean. In a federal state with a similar turnover rate, on average the reduction would be to about .74 above the mean.40 The effect of this slower adjustment can be seen clearly if one compares countries across long periods. The correlation between turnover in the 1950s and in the 1980s was .86 for federal structures but just .24 for unitary states. Thus, federalism appears to slow change in the degree of central bank practical independence, which in turn entrenches inflation rates.

Second, stickiness emerges in the extent of central government net lending (Table 5, column 4). Other things equal, in a unitary state whose central government devotes 20% more of outlays to net lending than the mean state in one five-year period, the share of net lending will drop by 8.8 percentage points in the next period (i.e., $20 \times -.44$). In an otherwise similar federal state, on average the drop will be no more than one or two percentage points.41 Sharp adjustments after episodes of heavy central lending are the norm in unitary states but are clearly the exception in federations. In unitary states, the share of central government outlays going to net lending can vary quite substantially from period to period; in federal states, it tends to stay either high or low. If, as suggested, this indicates in part the readiness of central government to bail out subnational units, the budget constraint in federal states appears to be generally either hard or soft but relatively constant.

The data do not support the conjecture that federal structure locks in larger or smaller central or subnational deficits. And there was no evidence that federal states adjust expenditure levels more slowly than unitary states. Federal structure might lock in some aspect of economic or political conditions that affect the strength of inflationary political pressures. The last two columns in Table 5 suggest, however, that neither the level of economic development nor the degree of exposure to imports is more persistent in federal than in unitary states. In both cases, the interaction term is

Note: The dependent variable is the Culoerman, Webb, and Neyapti (1992) index of turnover of central bank chief executive, over roughly ten-year penoda. Model 2 controls for log per-capita GDP Estimation is by least squares dummy vaniables; penel-corrected standard errors are in parentheses (adjusted for heteroskedestroity and contemporaneous correlation) "p < .05, "p < .01, ""p < .01 For data sources, see the Appendix. Penoda: 1960–71, 1972–79, 1980–89. Log average inflation previous decade is calculated as follows: 1960s = average of 1960 and (1965+59)/2, 1960s = average of 1960–84 and 1965–96, 1970s = average of 1970–74 and 1975–79, in each case, log of 1 + average inflation, all countries for which average inflation < 0 coded as 0. Domestio debt of central government is from IMF, *International Financial Statistics Yearbook*, 1994, lines 88b or 88a, as % of GDP, figures for 1990, 1970, and 1980. Log per-capits GDP in purchasing power parity terms, for 1960, 1970, 1980, is from Penn World Tables 5 8a

not at all significant. The discontinuous indicators of exchange rate system and political instability are not suitable for regression analysis. Instead, I compared

 $^{^{40}}$ The estimated change is .04 (i.e., the federal dummy effect) + (-.61 + .31) \times 1.

⁴¹ The estimates imply a change of $(-.44 + .43) \times 20 = -.2$.

the mean change in each indicator between periods for federal and unitary states (in absolute value terms). In the case of exchange rate, the figures are almost identical (.339 federal, .342 unitary). As for political instability, federal states had a larger average absolute value change in the number of revolutions and coups between decades, which suggests that the level of instability is not locked in by federal structure, although the difference is not at all significant.

What can we conclude about how federal structure entrenches either high or low inflation? I did not find convincing evidence that federalism systematically influences the stability of either central government deficits or spending levels. These wax and wane in both federal and unitary states. There does seem to be some influence on the relative degree to which fiscal imbalances pass upward through the system and induce change in monetary policy. This occurs at two key points in the process. First, governments in federal states apparently find it harder than those of unitary states to change the share of outlays they devote to lending, whether low or high. The problem is serious in the latter case, as subnational government deficits are pushed upward, adding to central deficits. Second, central banks that are in practice more independent are less likely to respond to fiscal pressures from large subnational or central deficits by increasing the money supply. Federal structure, by increasing the number of veto players required to change the system of control over central bankers, tends to lock in the degree of central bank independence, whether high or low. In the United States and Germany, where federalism has helped to preserve high central bank independence, this has served to keep inflation low, exactly as Lohmann (1998) argues. But in countries with weak central banks, federal structure makes it hard to reduce the inflation-causing politicization.

A few examples illustrate. Argentina and Brazil, two non-OECD federations, experienced high inflation rates in the 1970s and 1980s and had particular difficulty stabilizing (although both achieved some success in the 1990s). In both countries, the restraints on fiscal pressure afforded by low lending share and a strong bank were ineffective. Each had a high level of central lending, substantially above the median for developing countries, for most of the 1970s and 1980s.42 In that situation, subnational deficits tend to correlate closely with central deficits. Also, the extension of credit by the federal government or central bank was a major cause of inflation. In Argentina in the 1970s and 1980s, provincial governments borrowed heavily from provincial banks, which then discounted the loans to the central bank. In Brazil, the federal government bailed out subnational governments' debt to foreign investors and to domestic credit institutions, such as the federal housing and savings bank (Dillinger and Webb 1998).

Furthermore, throughout the whole postwar period, the governorship of the central bank in both countries turned over with far greater frequency than the average for developing countries. A Practical independence of the central bank was low in the 1950s and remained low in the 1980s. In each country, the central bank governor was particularly likely to be replaced during the six months after a change of government (Cukierman and Webb 1995). This article suggests why Brazil and Argentina had to struggle so painfully and ineffectively to stabilize an unbalanced fiscal and monetary system: Federal structure locked in the failures of the past.

Malaysia, by contrast, shows how a strong central bank can break the link between fiscal imbalances and inflation. In this case, federal structure may have helped preserve central bank independence. The country had large subnational deficits in the 1970s and 1980s (14.3% of subnational outlays in 1972), the central government devoted a relatively large proportion of outlays to net lending (11% in the early 1970s, 15% in the early 1980s), and central deficits were high (10% in the early 1970s, 16% in the early 1980s). Yet, despite fiscal pressures, monetary policy remained tight, and inflation stayed low (less than 10% in the 1970s and 1980s). The secret of success appears to be the high degree of central bank practical independence.44 In the 1970s, the Cukierman, Webb, and Neyapti (1992) index of turnover for Malaysia is zero, and in the 1980s it is .20. The Cukierman and Webb (1995) index of the political vulnerability of the central bank—the average number of changes in central bank governor during the six months after a change of government—for 1950-90 is zero.

To see how low central government lending can block the upward passage of deficits, consider Germany in the 1970s and 1980s. The deficits of Länder and localities in both decades were relatively high, reaching 2.1% of GDP in 1982, compared to a median that year of .5 for all countries in the data set. Yet, central government net lending did not exceed 2% of total outlays. Consistent with this relatively hard budget constraint, central deficits stayed low (a surplus of .7% of GDP in 1972, deficits of 2.1%, 2.0%, and 1.1% of GDP in 1977, 1982, and 1987, respectively; median central deficits those years were 2.6%, 3.6%,

⁴² Average annual share of net lending in central government outlays was 10.2%, 20.6%, 24.8%, and 46.8% in Brazil in 1972, 1977, 1982, and 1987, respectively. In Argentina, comparable figures were 2.1%, 7.9%, 11.8%, and 9.6% in 1973, 1977, 1982, and 1987 (1972 data were unavailable). The median share of net lending share among developing countries in the four periods was 4.8%, 5.0%, 4.9%, and 1.7%.

⁴³ For the 1950s, 1960s, 1970s, and 1980s, the Cuklerman, Webb, and Neyapti (1992) index of turnover had values of .71, 1.08, .88, and 1.00 for Argentina and 1.01, .50, .38, and .80 for Brazil, respectively. The median for developing countries in the four periods was .20, .26, .25, and .20

⁴⁴ Malaysia's access to credit markets also may have helped. Deficits were financed by heavy borrowing, first on domestic and then on foreign markets, before a sharp adjustment triggered by high interest rates brought the deficit down to manageable levels (Demery and Demery 1992). But credit may have been forthcoming in part because the markets believed in the central bank's conservatism. At the same time, that very high interest rates were sustained long enough to induce a major adjustment suggests the effective shielding of monetary policy from fiscal pressures.

The net lending share came to 1.3%, .64%, 1.1%, and .54% of central outlays in 1972, 1977, 1982, and 1987, compared to median values these years of 5.5%, 4.3%, 3.3%, and 1.2%, respectively, for all countries in the data set, and 5.3%, 4.2%, 2.8%, and .57% for the OECD countries.

4.7%, and 4.0% of GDP for all countries in the data set, and 1.5%, 3.4%, 4.8%, and 2.3% of GDP for just the OECD). The knowledge that the Bundesbank was highly independent and unlikely to monetize the national deficit may have helped focus the minds of central policymakers as they resisted fiscal pressures from below. German federalism also may have helped lock in the government's low lending policies. If an opposition majority in the Bundesrat could prevent the federal government from pressuring the Bundesbank to ease monetary policy and keep voters happy (Lohmann 1998), the same majority presumably could limit the government's freedom to lend irresponsibly to its allies in Land governments.

CONCLUSION

Scholars from Tiebout (1956) and Buchanan (1950) to Oates (1972) and Weingast (1997) have described the economic benefits to be expected from political and fiscal decentralization. Their work informs current efforts to restructure political and economic institutions in the postauthoritarian and postcommunist world. Recently, however, some scholars have raised fears that the widely understood benefits of decentralization may be accompanied by poorly understood but serious dangers (Davoodi and Zou 1998; Prud'homme 1995; Tanzi 1995).

One unresolved question concerns macroeconomic policy. There are several ways that decentralization may affect inflation in theory. On the one hand, decentralization may provide a useful restraint on central profligacy. On the other hand, it may create dangerous incentives for local fiscal free-riding. Or it may lock in current patterns of fiscal and monetary policy, whether profligate or conservative, by increasing the number of actors with a veto over changing the system of macroeconomic governance.

My empirical analysis finds support for the third hypothesis. In decentralized countries, average inflation rates tend to stay either consistently high or consistently low over quite long periods. In centralized states, by contrast, it appears easier for low inflation economies to slip into macroeconomic imbalance and for high inflation economies to stabilize. Average inflation in the late 1960s and the late 1980s correlates at .85 among federations, compared to -.02 among unitary states. In five of six tests, the difference is significant, whether an indicator of political decentralization (federal structure) or indicators of fiscal decentralization (the subnational expenditure or tax shares) are used, and controlling for numerous other possible causes of inflation. In some (mostly developed) countries, such as Germany and the United States, decentralization appears to lock in macroeconomic stability. In other (mostly developing) countries, such as Argentina and Brazil, decentralization has preserved high inflation.

Evidence from the 1970s and 1980s identifies two points in the fiscal and monetary policy process at which decentralization creates stickiness. I find that, as various scholars have argued, greater practical (not necessarily legal) independence of the central bank is associated with lower inflation. It turns out that the central bank's degree of practical independence is far more constant over time in federal than in unitary states. In Germany, for example, the division of power between central and regional governments has insulated the Bundesbank. Regional governments police the center, preventing any change to the established arm's-length relationship between the federal government and the central bank that would benefit federal politicians but not their regional counterparts. In other federations, such as Brazil, a norm of central bailouts of regional governments has developed, and regional governors use their considerable powers to defend the politicized nature of monetary policy.

The second point of stickiness in federal states is the degree to which central government uses its resources to extend loans—a plausible proxy for the hardness or softness of budget constraints. The share of government outlays devoted to net lending ranged in the late 1980s from −7% in New Zealand to 47% in Brazil. When net lending is high, large subnational deficits are associated with large central government deficits, which suggests that deficits are pushed upward for bailout. And when lending is high, so is inflation. The extent of central government lending is far more constant in federal than in unitary states. Some federal systems, such as Germany and Austria, were consistently low lenders in the 1970s and 1980s, but others, such as Brazil and India, were consistently high lenders. Political systems differ in their "fiscal conductivity"—the degree to which imbalances are pushed upward from local and regional to central budgets. Decentralization does not itself cause this, but it does appear to reduce change in the degree of conductivity, whether high or low. In countries like Brazil, with soft budget constraints, federal politics can hamper a shift to harder policy. In countries like Germany, with hard budget constraints, the status quo is preserved by decentralized political institutions that impede change to policies.

Developing countries tend to have weaker central banks and more central government lending than developed countries. As a result, decentralization correlates with lower inflation in the OECD but higher inflation among non-OECD members, although there are exceptions. In the federation of Malaysia, for instance, a very independent central bank apparently resisted fiscal pressures to boost monetary growth to inflationary levels in the 1970s and 1980s. Malaysia had average inflation of 1% in the late 1960s and 1.3% in the late 1980s. Low central bank independence in some developing countries is probably explained in part by their political instability. Revolutions or coups tend to be more frequent in poorer countries and are positively related to central bank director turnover. Malaysia, unlike a good number of Third World nations, experienced none of these events in the 1970s and 1980s.

Constitutional fragmentation is a major reason that political decentralization is associated with a persistent pattern of inflation, high or low. Decentralized systems increase the number of powerful political actors with influence over such areas as fiscal and monetary policy. But other ways of fragmenting political authority also exist. In Chile, for example, one of the more centralized developing countries, a system of elaborate checks and balances was set up by the Pinochet regime before leaving office. Some important administrative posts, including the head of the central bank, are insulated from control by elected officials, and a supermajority is necessary to overturn the laws guaranteeing that insulation (Londregan 2000). Such provisions arguably have helped preserve central bank independence and low inflation in Chile, without political decentralization. A study of whether kinds of political fragmentation other than those produced by decentralization also perpetuate macroeconomic policy would be valuable.

Constitutional fragmentation can be overcome if actors in the different power centers belong to a single cohesive party, and one might expect less policy persistence in federal states under that condition. This may explain the Menem regime's surprisingly successful reforms to the Argentine monetary system in the early 1990s. For the first time since democratization, the president, a majority in both legislative chambers, and a majority of state governors were all from the same party (Jones 1997). Exploring interactions between political decentralization and party dominance is an obvious direction for future research.

Several other questions await further study. First, is a high level of central government lending a symptom or cause of soft budget constraints? I suspect the answer is "both," but more the former than the latter. Second, the kinds of decentralization I was able to examine conflate decentralization to regions or states with decentralization to localities. The dangers created by strengthening intermediate units may be reduced if authority is decentralized even further, to the municipal level. Third, and most important, more research is needed to discover precisely how the institutions of specific federal systems impede changes in the degree of central bank independence or central government lending policies. This article establishes a general answer—the large number of veto players in federal systems—but the details of institutional mechanisms are likely to vary from case to case. Ultimately, the association of political decentralization with a large number of veto players, and of more veto players with more stable monetary policy, should be tested directly in a worldwide sample. This will require the construction of a data set, including both developed and developing countries, of the number of veto players with leverage over central policy enactment and implementation in specific areas. That is a gargantuan task, but an important one.

If my analysis is correct, important policy implications follow from it. Attempts to reduce inflation by introducing federal institutions into countries with soft budget constraints on subnational governments and a politically dependent central bank are likely to prove disastrous. Such institutions will not reduce inflationary pressures, and they will tend to lock in the existing politicization of monetary policy and make stabilization considerably harder. Lessons derived from lowinflation, developed federal states, such as Germany, Switzerland, or the United States, may have perverse consequences if applied in many developing world settings.

Furthermore, the order in which political and economic reforms are implemented appears to be extremely important. Successful stabilization of monetary policy followed by political decentralization can maximize the advantages of both. Political decentralization followed by macroeconomic stabilization is likely to fail and risks a speedier slide into hyperinflation. This parallels the logic of my game-theoretic treatment of decentralization and economic reform (Treisman 1999). Modeling the interactions between center and regions in two-level states, I found that the same political and economic reforms can have drastically different results when implemented in the opposite order. Political decentralization followed by an increase in the center's rate of public good provision can prompt a vicious cycle of fiscal redistribution, regional challenges, and increasing deficits, whereas the same reforms in reverse order can leave the state as fiscally solvent and peaceful as when they started.

Decentralization has many advantages, but my findings suggest at least caution in recommending it to developing countries that face major macroeconomic stresses. As Poland embarks on a plan to create stronger regional governments, South Africa struggles to impose financial discipline on its new provinces, and similar projects are debated in countries around the globe, these issues are likely to become increasingly important.

APPENDIX

Inflation Data: Average of annual inflation rates of CPI 1970–74, 1975–79, 1980–84, 1985–89. Unless otherwise indicated, from IMF, International Funancial Statistics Yearbook, 1994, 106–9 (line 64). Notes: Poland 1971–74; Czechoslovakia 1971–74; Hungary 1973–74; China 1971–74; Kuwait 1973–74; Nicaragua 1973–74; Romania 1971, 1973, 1974; Uganda 1981–84; Jordan 1985, 1987–89.

Subnational Expenditure Shares: Unless otherwise noted these are calculated as (state + local government total expenditures)/(consolidated central government total expenditures + state + local government total expenditures) 1972, 1977, 1982, 1987, from IMF, Government Finance Statistics Yearbook, 1977, 1978, 1979.

Subnational Tax Shares: Unless otherwise noted these are calculated as (state + local government total tax revenues)/(consolidated central government total tax revenues + state + local government total tax revenues) 1972, 1977, 1982, 1987, from IMF, Government Finance Statistics Yearbook, 1977, 1978, 1979, 1986, 1988, 1990, 1997.

Notes on Expenditure and Tax Variables

For 1972 Variables: Canada 1973, 1974 for expenditures; Netherlands 1973, 1974 for expenditures; USA 1973; Austria 1973; France 1974; Korea 1974; Jordan 1974 (budgetary central government); Chile 1974; Spain 1973, 1972 for expenditures; Italy 1973; Ecuador 1974 (tax variables 1975); Mexico 1974 for tax; Brazil expenditure 1974 from Garman, Haggard, and Willis (1996), tax 1972 from Shah (1991, 16);

Colombia 1974; India 1974; Kenya budgetary central government; Zaire 1973; Pakistan 1975; Cameroon 1975 and local revenue is all revenue, not just tax; Iran 1973; Indonesia 1975; Bangladesh 1974 for expenditures, for others 1975 (central is "budgetary central government," local is total revenue); Taiwan (ROC) 1973; Uruguay 1973 (total revenue instead of tax, both levels); Zimbabwe from World Bank (1997) for 1974; Japan 1975, from Shibata (1993, 145).

For 1977 Variables: Belgium 1978; Malaysia local revenue is total revenue, not tax revenue; note Greece unit change from 1972; Italy 1975; Uganda 1980 and "budgetary central government"; Bangladesh central is "budgetary central government," local is "total revenue"; Trinidad and Tobago 1979; Uruguay local is total revenue; Honduras 1976; Zambia is "budgetary central government"; Bolivia 1980; Philippines 1978; Japan 1974; Taiwan 1977; Uruguay both levels are "total revenue"; Japan 1975 from Shibata (1993, 145); Indonesia 1975–76 from Shah (1994, 196); Brazil tax 1977 from Shah (1991, 16).

For 1982 Variables: New Zealand 1981 "budgetary central government"; Poland 1984; Bolivia 1985; Uruguay local is total revenue; Ethiopia 1981; Italy 1985; Ecuador 1980; Italy tax 1985; Japan 1980 from Shibata (1993, 145); Mexico from Garman, Haggard, and Willis (1996); Argentina 1983 from Garman, Haggard, and Willis (1996); Brazil expenditure from Fundacion de Investigaciones Economicas Latino-americanas (1993), tax 1982 from Shah (1991, 16); Venezuela 1980 from Garman, Haggard, and Willis (1996); Taiwan from Statistical Yearbook of the ROC, 1995; Honduras from Nickson (1995), figures are for 1984; Indonesia 1980–81 from Shah (1994, 196).

For 1987 Variables: New Zealand 1987 tax figure is imputed from 1990 figure of 6.9 in World Bank (2000, 217). Switzerland 1987 tax figure is imputed from 1990 figure of 37.0 in World Bank (2000, 217). Malaysia 1988 tax figure used. Japan 1985 from Shibata (1993, 145). Argentina 1987 tax figure imputed from 1990 figure of 38.2 in World Bank (2000, 217). Colombia tax figure for 1986 used. Indonesia 1985-86 from Shah (1994, 196). Venezuela 1989 from Garman, Haggard, and Willis (1996); 1977 tax figure imputed from 1972 and 1982 ones. Pakistan and Nigeria from Shah (1994, 52). Kenya 1986. Taiwan from Statistical Yearbook of the ROC, 1995. Dominican Republic from Nickson (1995) for 1986. Nicaragua from Nickson (1995) for 1989. Peru is figure for 1990 from World Bank (2000, 217). Panama from Nickson (1995) for 1991. Costa Rica from Nickson (1995) for 1984. Brazil tax 1987 from Shah (1991, 16); expenditure for 1988, from Shah (1991, 18). Ethiopia 1987 tax figure is imputed from 1990 figure of 1.6 in World Bank (2000, 217). Costa Rica 1990 tax figure from World Bank (2000, 217) used for 1987; 1977 and 82 figures imputed from 1972 and 1990 figures.

GDP per Capita: From Penn World Tables 5.6a, ppp, 1970, 1975, 1980, 1985.

Imports: From IMF, International Financial Statistics Yearbook, 1994 and 1990, 1970, 1975, 1980, 1985.

Money Growth: Average annual money growth in % (IMF, International Financial Statistics Yearbooks, line 34); "money" = demand deposits + currency outside banks.

Central Government Budget Deficit (-), Surplus (+): As percentage of GDP 1972, 1977, 1982, 1987 from IMF, International Financial Statistics Yearbook, 1987 and 1994.

Central Government Expenditure: As percentage of GDP 1972, 1977, 1982, 1987 from IMF, International Financial Statistics Yearbook, 1987 and 1994.

Central Government Net Lending: As percentage of central government expenditure plus lending minus repayments, from IMF, Government Finance Statistics Yearbooks, 1972, 1977, 1982, 1987, or a close year.

Subnational Budget Deflett (-), Surplus (+): GDP from World Bank 1992; subnational deficit = deflect of state budgets plus deficit of local budgets, from IMF, Government Finance Statistics Yearbook, 1972, 1977, 1982, 1987.

Domestic Debt of Central Government: As percentage of GDP, domestic debt of government as of 1960, IMF, International Financial Statistics Yearbook, 1994, line 88b or 88a. GDP also from IMF, International Financial Statistics Yearbook, 1987 and 1994.

Revolutions and Coups: From Easterly and Levine (1997) data set. Yugoslavia coded as no revolutions or coups in 1970s or 1980s.

Legislative Professionalism and Incumbent Reelection: The Development of Institutional Boundaries

WILLIAM D. BERRY Florida State University
MICHAEL B. BERKMAN The Pennsylvania State University
STUART SCHNEIDERMAN Associated Press

It is well established that legislators from highly professionalized bodies are more likely to win reelection than members of less professionalized legislatures. We find that the effect of professionalization on incumbent electoral success is far more pervasive. As the level of professionalism of a legislature increases, the effects of external political and economic forces (such as coattails from higher level elections and national economic conditions) on a legislator's chances for reelection diminish in strength. This implies that legislative professionalization promotes institutionalization by establishing boundaries that insulate members from external shocks. We reach these conclusions by specifying and testing a district-level model of state legislative election outcomes, using as dependent variable the probability that an incumbent will win reelection. The model is estimated with probit using data for more than 42,000 state legislators from 1970 to 1989.

7 hat determines whether a legislator seeking reelection will win? We address this question by paying particular attention to the role of professionalization of legislatures in influencing the electoral success of members. We know that American legislators are highly likely to win reelection (Garand 1991; Jacobson 1987; King 1991). We also know that those from highly professionalized institutions have even better odds than those from less professionalized bodies, as the former have greater resources for travel to their districts (Holbrook and Tidmarch 1991), for casework (Cox and Morgenstern 1993, 1995; King 1991), and for devoting time and energy to campaign activities (Carey, Niemi, and Powell 2000). We maintain, however, that professionalism does more than boost the electoral prospects of incumbents; it changes members' relationships with the legislature's political and economic environment. In particular, professionalization promotes legislative institutionalization by establishing boundaries that shield members from external shocks.

William D. Berry is Marian D. Irish Professor of Political Science, Florida State University, Tallahassee, FL 32306-2230 (wberry@garnet.acns.fsu.edu). Michael B. Berkman is Associate Professor of Political Science, The Pennsylvania State University, University Park, PA 16802 (mbb1@psu.edu). Stuart Schneiderman is Manager of Market Research and Strategic Planning, Associated Press, New York, NY 10020 (sschneiderman@ap.org).

An earlier version of this article was presented at the annual meeting of the Midwest Political Science Association, Chicago, April 1998. We thank the participants in Gary King and Ken Scheve's Fall 1997 Advanced Quantitative Research Methods class at Harvard for their comments on our model and method of estimation. We also thank several colleagues for insightful comments on earlier versions of our article or argument: Paul Brace, Bill Claggett, Suzanna DeBoef, Mo Fiorma, Gary Jacobson, Aubrey Jewett, Sara McLaughlin, Glenn Parker, Eric Plutzer, Chris Reenock, Mitch Sanders, and Ron Weber. We refer in this article to an unpublished supplement, which is available at the APSR web site A replication data set has been deposited at the ICPSR's publication related archive (Berry, Berkman, and Schneiderman 2000).

PROFESSIONALIZATION AND THE ESTABLISHMENT OF INSTITUTIONAL BOUNDARIES

Professionalization is a model used predominantly in the literature on state legislatures and refers to the development of overall legislative capacity (Hibbing 1999). A professionalized legislature is one with abundant resources; in particular, Rosenthal (1996, 1998) refers to the five S's: space, salary, session length, staff, and structure. Institutionalization, in contrast, is a broader model of legislative development employed primarily in the literature on Congress (Hibbing 1999). Polsby (1968) suggests that institutionalized legislatures have three characteristics (see also Cooper and Brady 1981; Hibbing 1988; Squire 1992), two of which relate to internal operations; they are internally complex and rely on universalistic, rather then discretionary, criteria.1 The third and most critical characteristic-the "conceptual core" (Rosenthal 1996, 185) of institutionalization—is the presence of boundaries, the separation of the legislature from its political, economic, and social environment (Cooper and Brady 1981; Huntington 1965; Polsby 1968).

Scholars have set forth two requirements for a legislature to be bounded, both of which relate to the nature of elections. First, according to Polsby (1968, 145–6), in a bounded legislature "it is relatively difficult to become a member," and turnover is low. This implies elections in which incumbents have a high probability of victory. Second, in a bounded legislature, elections are insulated or buffered from the effects of external political and economic shocks (Chubb 1988; Hibbing 1999). Such elections are similar to those characterized by Jacobson (1997) and other students of

¹ Complex legislatures have "functions that are internally separated and parts that are not wholly interchangeable" (Rosenthal 1996, 183); universalistic criteria refer to standard, consistent rules (such as seniority to determine committee rank)

Congress (e.g., Herrnson 1998; Salmore and Salmore 1985) as candidate centered, because the insulation of elections from external forces makes incumbents personally "responsible for [their own] reelection" (Jacobson 1997, 33).

Our central thesis is that with legislative professionalism come the boundaries necessary for institutionalization. Although professionalization and institutionalization generally have been treated as distinct models of legislative development, several scholars have proposed this linkage (Hibbing 1999; Moncrief and Thompson 1992; Rosenthal 1998; Squire 1992). Their argument is straightforward. Professionalization changes both the incentives and capabilities of legislators because it gives them resources (e.g., "money, perquisites, staffers, information" [Hibbing 1999, 163]) that make a long career in the legislature attractive. At the same time, it provides the "electoral resources that members may use to insulate themselves from changing political tides" and make a long career possible (Squire 1997, 41). What has been lacking in the literature is a strategy for a decisive empirical test of the hypothesis that professionalization leads to boundaries essential for institutionalization.

We propose that this hypothesis implies two testable propositions, each related to one of the requirements for a legislature to be bounded. The first is the familiar assertion that incumbency advantage is tied to legislative resources: With all else equal, as the level of professionalism of a legislature increases, its members' probability of winning reelection also rises. This hypothesis has received much empirical support (e.g., Carey, Niemi, and Powell 2000; Cox and Morgenstern 1993, 1995; Holbrook and Tidmarch 1991; King 1991; Weber, Tucker, and Brace 1991).2 The second proposition is that as a legislature's level of professionalism increases, so does the extent to which legislative elections are insulated from external forces. Put differently, external political and economic shocks have their strongest effects on the probability that incumbents will win reelection when professionalism is low, and they have weaker effects when greater professionalism serves to buffer incumbents from these forces.

Support for this second proposition is less definitive. It is certainly consistent with the declining influence of national economic conditions (Campbell 1993; Erikson 1990; Radcliff 1988) and presidential coattails (Campbell 1986; Jacobson 1997) on congressional election outcomes, which occurred as members of Congress were acquiring greater resources to devote to constituency service (Jacobson 1990). Ultimately, however, this hypothesis is difficult to test with congressional data because the number of sessions to observe is

small, and numerous political and economic variables have changed colinearly with congressional resources (King 1991).

Chubb (1988) conducted the most extensive empirical analysis of the hypothesis and obtained mixed results: He found that a high degree of legislative professionalism fails to insulate state legislative elections from the effects of national economic conditions but does buffer them from coattail effects of higher level elections.³ His conclusions, however, are based on aggregate analysis of the shares of legislative seats controlled by the major parties and do not necessarily reflect the influence of external forces on the success of individual incumbents. For example, as Jacobson (1990, 80) notes, aggregate seat shares can "track [higher level election] results even though the [results are] a poor predictor of the . . . winner in any particular district."

A DISTRICT-LEVEL MODEL OF INCUMBENT ELECTORAL SUCCESS

Our primary theoretical focus is the proposition that legislative professionalization promotes institutionalization by creating boundaries that insulate members from external electoral shocks. Our strategy for testing this hypothesis requires us to develop a model explaining the probability that an incumbent legislator will win reelection. We incorporate a variety of factors identified by research on Congress and state legislatures as influencing the vulnerability of incumbents to electoral defeat. In addition to legislative professionalism, these include such individual/district-level characteristics of legislators as their margin of victory in the previous race, their term length, and the type of district in which they compete, as well as such contextual factors as redistricting, coattail effects from higher level contests, and national economic conditions.

We introduce an original proposition about economic conditions. Most previous studies advance a responsible party voting model, which assumes that voters hold the president's party responsible for the state of the economy and that all candidates of the party receive the same credit or blame (e.g., Jacobson 1990; Kramer 1971). In contrast, Hibbing and Alford (1981) offer what Stein (1990) refers to as the restricted in-party culpability thesis, which suggests that presidential party incumbents are held responsible for the economy, but nonincumbents of the same party are not. We propose a more complex differential responsibility model: Nonincumbents of the president's party are held responsible for economic conditions but to a lesser degree than incumbents.

We test our model using data for more than 42,000 state legislators from 1970 to 1989. Although our chief

² Except for Carey, Niemi, and Powell (2000), these studies find evidence of the role of legislative resources in protecting incumbents but do not directly assess the effect of resources on the probability that an incumbent will win reelection. Instead, they look at vote margins, margin-based measures (i.e., sophomore surge, incumbency advantage), or whether an incumbent is challenged.

³ Chubb (1988) refers more frequently to institutionalization than professionalization, but we argue that he blurs the conceptual distinction between the two terms so that they are treated as virtually synonymous.

theoretical interest is in professionalism's role in creating legislative boundaries, our large sample permits improved tests of many hypotheses from the elections literature. For example, there are sufficient degrees of freedom to measure separately presidential, gubernatorial, and senatorial coattails, and to measure these effects with a wide range of statistical controls.

HYPOTHESES

We begin by developing hypotheses about the effects on the probability of reelection of (1) a legislator's historical electoral strength, (2) the strength of candidates running higher on the ticket, and (3) national economic conditions, that should hold at any fixed level of professionalism. Then we turn to our central proposition—that legislative professionalism creates the boundaries necessary for institutionalization. We argue that this implies several hypotheses about the influence of professionalism on the probability of incumbent victory, including ones that specify interaction between professionalism and each of (1) historical electoral strength, (2) the strength of higher level candidates, and (3) economic conditions. We conclude the presentation of our model by considering the effects of various district election rules and redistricting on the probability of reelection.

Historical Electoral Strength

A candidate's strength in one election is a strong determinant of the chances of success in the next race (Garand 1991; Jacobson 1987). Someone who wins by a thin margin probably has significant personal weaknesses or a dearth of partisan supporters in the district, and these problems are likely to persist for the next election. In contrast, candidates who win impressively are likely to be perceived by potential challengers and contributors as secure in the next election (Krasno and Green 1988) and are less likely to attract a well-funded challenger of high quality. Lack of opposition is another sign of strength. This suggests that legislators who ran unopposed in their previous race have a greater probability of winning reelection than those who faced opposition. Yet, it is likely that there is some threshold vote margin at which a victory in a contested election becomes so decisive that it is more intimidating to potential challengers than even an uncontested victory.

HYPOTHESIS 1. Incumbents who were unopposed in their previous race have a higher probability of reelection than those who faced opposition and won with a "typical" margin. Only legislators who won by an overwhelming margin in their previous race have a higher probability of victory than those who were uncontested.

HYPOTHESIS 2. For incumbents contested in their previous race, the greater their margin of victory in that election, the greater is the probability of their reelection.

Coattails

The essence of the coattail proposition is familiar: A party's presidential, gubernatorial, and senatorial candidates influence the prospects of its congressional and state legislative candidates on the same ballot. Popular candidates for higher office bring party supporters to the polls, and candidates at lower levels enjoy a spill-over effect (Campbell 1993; Jacobson 1997). Therefore, in the case of state legislators:

HYPOTHESIS 3. When an election for higher office (presidential, gubernatorial, or senatorial) is being held simultaneously, the greater the vote percentage for that office received by the party of a state legislator, the greater is his probability of reelection.

Previous research on the relative strength of presidential, gubernatorial, and senatorial coattails has yielded mixed results (Campbell 1986, 53; Chubb 1988; Lowry, Alt, and Ferree 1999). We expect presidential coattails to be the strongest, based on the much greater visibility of the presidency in relation to the other two offices. Because there is no systematic difference in the visibility of gubernatorial and senatorial elections, it is less evident which of these should produce stronger coattails. It seems plausible, however, that the choice for state legislator is somewhat more likely to be influenced by the preference for governor than that for U.S. senator, since governors and state legislators deal with the same issues, whereas senators deal with often distinct national policy issues.

HYPOTHESIS 4. The coattail effect is strongest for presidential elections, weakest for senatorial races, and in between for gubernatorial contests.

Economic Conditions

A strong national economy helps congressional candidates of the president's party, and a poor economy hurts them (Hibbing and Alford 1981; Jacobson 1990; Kramer 1971). Governors, under some circumstances, are held accountable for state economic conditions (Leyden and Borrelli 1995; Lowry, Alt, and Ferree 1999), but state legislative candidates are not (Chubb 1988; Lowry, Alt, and Ferree 1999; Stein 1990). Chubb (1988) finds, however, that state legislators of the president's party are subject to the same influence of national economic conditions as members of Congress.

⁴ The share of voters within an incumbent's district who strongly identify with her party is another likely determinant of reelection probability. Our desire to test our model using all state legislative races over two decades makes it infeasible to collect data on district-level party strength. Our empirical analysis may overestimate the effect of victory margin in the previous election because its coefficient may be capturing some of the influence of party strength.

Most economic voting studies rest on the responsible party model, which assumes that voters deem the presidential party responsible for the economy and that all candidates of the party receive the same credit or blame (Chubb 1988; Jacobson 1990; Kramer 1971; Tufte 1975). Hibbing and Alford (1981) and Stein (1990) challenge this view; their restricted in-party culpability thesis assumes that incumbents of the president's party are held responsible for the economy, but nonincumbents (challengers and open-seat candidates) of the same party are not. Tests of this thesis have yielded mixed results (Fiorina 1983; Stein 1990).

We consider these assumptions about nonincumbents of the president's party too extreme and propose a third option, the differential responsibility model. We hypothesize that challengers from the presidential party are held responsible for economic conditions but to a lesser degree than incumbents. Voters recognize that a challenger cannot fairly be blamed for bad economic conditions (or credited for a good economy), but they may still want to punish (or reward) the party they hold responsible; if so, they may act as if challengers from the president's party have partial responsibility for economic conditions.

These three models of economic voting lead to similar expectations regarding incumbents of the president's party: Their probability of victory should be positively related to economic performance. All three models also assume that incumbents in the opposition party receive no credit or blame for economic conditions. This means that the influence of economic conditions on the probability that an incumbent of the opposition party will be reelected depends on the degree to which her challenger is held responsible for the condition of the economy. If the restricted in-party culpability thesis is correct, and thus the electorate does not hold her challenger responsible, then economic conditions should have no effect on the probability that she will win reelection. At the other extreme, if the responsible party model is right, and challengers from the presidential party are held as responsible as its incumbents, then good economic conditions should have a negative effect on the probability that an opposition party incumbent will win, and the magnitude of this effect should be the same as that of the positive effect of good economic conditions on the probability of victory for an incumbent of the president's party. Finally, if our differential responsibility model is correct, then good economic conditions should have a negative influence on the probability that an opposition-party legislator will win reelection, but the magnitude will be smaller than the positive effect of good economic conditions on the likelihood that an incumbent of the presidential party will win. The differential responsibility model leads us to propose the following.

Hypothesis 5. (i) For a legislator of the same party as the president, an improvement in national economic con-

ditions results in an increase in the probability of winning reelection. (ii) For a legislator of the opposition party, a similar improvement in economic conditions leads to a decrease in the probability of winning, but one of smaller magnitude than in part (i).

Our theory of the influence of economic conditions is depicted in Figure 1. At this point, we are not considering the role of legislative professionalism; therefore, restrict attention to the bottom two lines in the graph, in which professionalism is held constant (at a low level). In the figure, hypothesis 5(i) predicts that the slope of line AB is positive, whereas hypothesis 5(ii) suggests that EF has a negative slope smaller in magnitude than that of AB.

Finally, if incumbents of the president's party are held responsible for the economy, but members of the opposition party are not (as all three models of economic voting maintain), two other predictions should be met regardless of the degree to which voters hold challengers from the president's party responsible.

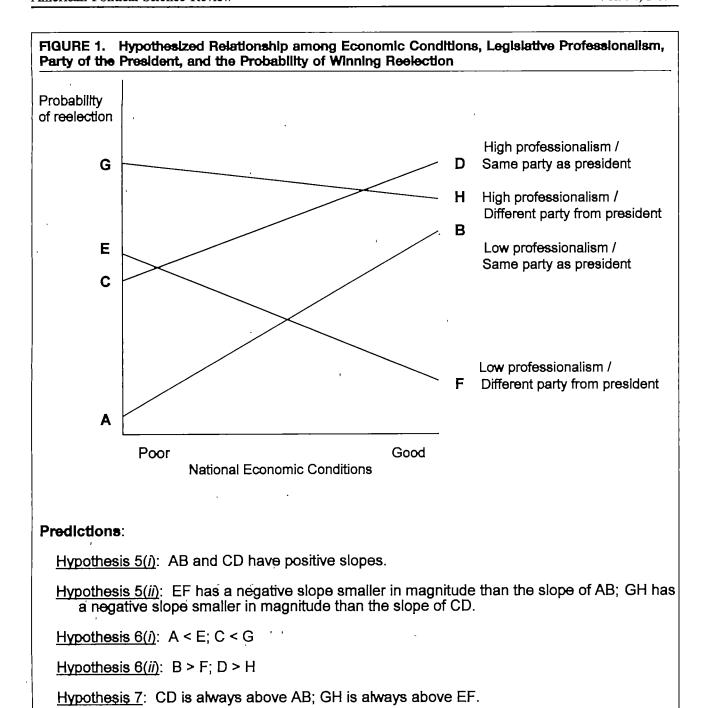

HYPOTHESIS 6. (i) When economic conditions are poor, the probability of reelection is lower for legislators from the president's party than for legislators of the opposite party. (In Figure 1, A < E). (ii) When economic conditions are good, the probability of reelection is higher for legislators from the president's party. (In Figure 1, B > F).

The Role of Legislative Professionalism

We have defined a bounded legislature as one in which two conditions are satisfied: Members have a high probability of winning reelection, and elections are insulated from the effects of external political and economic shocks. Professionalism promotes the establishment of boundaries by influencing the goals of legislators and by giving them resources that help them attain their goals.

The abundance of resources available in a highly professionalized legislature increases the incentive for members to desire a long career by giving them an attractive and productive work environment (Fiorina 1994; Moncrief 1999). Furthermore, these resources enhance their ability to achieve the goal of a long career. Large budgets permit extensive constituency service. Strong staff support enhances the governing capacity of legislatures and thus the ability of members to claim credit for policy initiatives. Both effective governance and constituency service heighten the popularity of members and their chances of reelection. Moreover, in highly professionalized legislatures members tend to be full time and have relatively large travel allowances. These advantages contribute to their public visibility and name recognition, which increase their probability of winning reelection.

Hypothesis 7. As a legislature's level of professionalism rises, its members' probability of winning reelection increases.

Legislators interested in a long career also have a strong stake in avoiding uncertainty by shielding themselves from the effects of external electoral shocks over which they have little control. Of course, such shielding insulates them not only from harmful forces (e.g., a weak presidential candidate on the same ballot) but also from beneficial ones (e.g., a strong presidential candidate). We argue that incumbents are willing to forgo the potential benefits in return for protection from potential costs. They recognize that since a huge majority of incumbents (more than 90%) are reelected,

Hypothesis 8(b): GH is not as steep as EF; CD is not as steep as AB.

there is a bias in their favor. As a result, they perceive the risk from "negative" external forces to be greater than the potential from "positive" forces. (In effect, given a probability of reelection greater than .90, there is much more room to fall than rise.) Because members of a highly professionalized legislature should be able to take advantage of the available resources to focus attention on themselves through both their legislative and campaign activities, they are more likely than members of less professionalized bodies to be able to shield themselves from external forces.

HYPOTHESIS 8. As the level of professionalism of a legislature increases, so does the degree to which elections are buffered from external political and economic forces. These forces have their strongest effects on the probability of winning reelection when the level of professionalism is low, and their effects become weaker as professionalism increases.

We hypothesized earlier that the probability of an incumbent's reelection is influenced by two types of external forces: the outcomes of higher level elections and national economic conditions. We now refine these predictions and hypothesize interaction between level of professionalism and these forces in influencing the probability of incumbent reelection, which yields two corollaries to hypothesis 8.

Hypothesis 8(a). As legislative professionalism increases, presidential, gubernatorial, and senatorial coattail effects decrease in magnitude (i.e., as the level of professionalism of an incumbent's institution increases, the positive effect of the percentage of the vote received by her party in a simultaneous higher level election on her probability of winning reelection declines in strength).

Hypothesis 8(b). As legislative professionalism increases, the magnitude of the effect of economic conditions on the probability that a legislator will win decreases in strength. (In Figure 1, GH is not as steep as EF, and CD is not as steep as AB.)

We apply similar logic to hypothesize that the effect of a legislator's previous margin of victory on his probability of reelection is buffered by a high level of professionalism. We have argued that highly professionalized legislatures are likely to attract career-oriented members with a great stake in being reelected. After surviving a close race, such members should direct much attention in the next term to overcoming the weaknesses that nearly cost them their seat. Moreover, members of highly professionalized legislatures have substantial resources to devote to this effort, which enhances the chance of success. In contrast, the future prospects of legislators with fewer resources are more likely to be determined by their previous success: Those who win big probably can repeat their success the next time around; those who win by a small margin are likely to remain vulnerable.

HYPOTHESIS 9. For incumbents contested in the previous election, as legislative professionalism increases, the positive effect of their margin of victory in the previous race on their probability of reelection decreases in magnitude.

District Electoral Rules

Although most state legislative elections are contested in single-member districts (SMDs), several forms of multimember districts (MMDs) can be found in some states. In free-for-all MMDs—also called true MMDsall candidates for the district's seats run against one another. In MMDs with positions—that is, post elections—candidates must specify the post for which they are running, and typically each post election will pit one Democrat against one Republican. Cox and Morgenstern (1995) found that the incumbency advantage emerged earliest in states with SMDs but then grew at a more rapid rate in states with true MMDs, so that by the 1980s, it was nearly equal in both. More recently, Carey, Niemi, and Powell (2000) found that incumbents in SMDs have a higher probability of reelection than those in either true MMDs or post elections, which is attributed to the "name recognition advantage" legislators in SMDs derive from their status as "monopoly providers of legislative representation for their districts" (pp. 683-4). Carey, Niemi, and Powell hypothesize, however, that although incumbents from true MMDs and post election districts face the same name recognition difficulties, challengers in true MMDs have better prospects for unseating incumbents because of the "larger numbers of candidates competing and smaller overall vote shares required for victory" (p. 684). This reasoning implies the following.

Hypothesis 10. Incumbents running in single-member districts have a higher probability of winning than those running in post elections, who in turn have a greater probability of victory than those in true multimember districts.⁵

Districts also differ in term length. In most states, the variation is by chamber; state senators serve longer terms than members of the lower house. This is not the case in all states, and we prefer to focus on variation in term length rather than variation in the nominal designation of the chamber as upper or lower, because we believe that term length reflects more theoretically meaningful variation. We predict that legislators who serve shorter terms should be less vulnerable to defeat. A shorter term increases the frequency of campaigning, which contributes to greater visibility for incumbents. Also, a longer term makes seats more desirable to challengers but creates fewer opportunities for candidates to run, which increases the probability that a high-quality challenger will emerge in any single race (Carey, Niemi, and Powell 2000).

Hypothesis 11. Legislators holding two-year terms have a higher probability of reelection than those with four-year terms.

Redistricting

Two conditions need to be satisfied for political parties to be able to manipulate the redistricting process to the

⁵ We consider MMDs with alternating years to be functionally equivalent to MMDs with positions, since they impose the same name recognition difficulties for legislators, and they both generally have one Democrat and one Republican competing for a single seat.

benefit of their candidates. First, the legislature and the governor—rather than the courts—must have primary responsibility for redistricting (Campagna and Grofman 1990).⁶ Second, a single party must control the governor's office and both chambers of the legislature.

HYPOTHESIS 12. In an election immediately following redistricting, a legislator has (i) the greatest probability of reelection if his party had full control over the redistricting process (i.e., the legislature and the governor had independent authority to draw districts, and the legislator's party had control of the governorship and both houses of the legislature), (ii) the lowest probability of winning if the other party had full control over redistricting, and (iii) an intermediate probability if the legislature and governor did not have independent control over redistricting or there was divided party control of the legislative and executive branches.

SPECIFYING THE MODEL AND OPERATIONALIZING VARIABLES

Together, the hypotheses developed in the previous section imply the following probit model:

$$WinNext_{t} = \Phi \left(\beta_{0} + \beta_{1} Profess_{t} + \beta_{2} Contest Prev_{t} \right) \\ + \beta_{3} \left[(Contest Prev_{t}) \left(Margin_{t-1} \right) \right] \\ + \beta_{4} \left[(Contest Prev_{t}) \left(Margin_{t-1} \right) \left(Profess_{t} \right) \right] \\ + \beta_{5} PresElecYr_{t} + \beta_{6} \left[(PresElecYr_{t}) (Profess_{t}) \right] \\ + \beta_{7} OwnPartyPresVote\mathcal{H}_{t} + \beta_{8} \left[(OwnPartyPresVote\mathcal{H}_{t}) \right] \\ \cdot (Profess_{t}) \right] + \beta_{9} GubElecYr_{t} + \beta_{10} \left[(GubElecYr_{t}) \right] \\ \cdot (Profess_{t}) \right] + \beta_{11} OwnPartyGubVote\mathcal{H}_{t} \\ + \beta_{12} \left[(OwnPartyGubVote\mathcal{H}_{t}) (Profess_{t}) \right] \\ + \beta_{13} SenElecYr_{t} + \beta_{14} \left[(SenElecYr_{t}) (Profess_{t}) \right] \\ + \beta_{15} OwnPartySenVote\mathcal{H}_{t} \\ + \beta_{16} \left[(OwnPartySenVote\mathcal{H}_{t}) (Profess_{t}) \right] \\ + \beta_{17} EconCondit_{t} + \beta_{18} \left[(Profess_{t}) (EconCondit_{t}) \right] \\ + \beta_{19} NotPresParty_{t} + \beta_{20} \left[(NotPresParty_{t}) (Profess_{t}) \right] \\ + \beta_{22} \left[(NotPresParty_{t}) (EconCondit_{t}) (Profess_{t}) \right] \\ + \beta_{23} \left[(AfterRedist_{t}) (OwnPartyRedist_{t}) \right] \\ + \beta_{24} \left[(AfterRedist_{t}) (OppPartyRedist_{t}) \right] + \beta_{25} Term2Yr_{t} \end{aligned}$$

+ $\beta_{26}SMDist_t + \beta_{22}PostDist_t$).

The unit of analysis is the state legislator seeking reelection, and Φ denotes the cumulative normal distribution function. The conceptual dependent variable, $WinNext_p$, is the probability that the legislator will win the election in year t. The observed dependent variable is dichotomous; it equals one if the legislator wins, zero otherwise.

The independent variable of greatest theoretical interest is *Profess*, the level of professionalism of an incumbent's legislature. We believe that operating budget per member—an indicator used by King (1991), Weber, Tucker, and Brace (1991), Van Dunk and Weber (1997), and others—is the purest measure of the total resources available to a legislature's members and is thus the best indicator of professionalism. For this reason, we use the size of the legislative operating budget per member in real dollars, linearly transformed (to facilitate interpretation) so that zero denotes the lowest value during the period of analysis, and one represents the highest.

One important aspect of the degree of professionalism of a legislature is the amount of compensation members receive. Yet, salary is a weaker measure of professionalism because a legislature that pays well but provides its members few additional resources should not be deemed highly professionalized. Nevertheless, we also estimate our model using average real legislative salary as the indicator of professionalism because that measure is frequently used (e.g., Chubb 1988; Fiorina 1994) and because Carey, Niemi, and Powell (2000) argue that, of the various resources available to highly professionalized state legislatures, a high salary is the most important contributor to incumbent electoral success. Our empirical findings change very little with this alternative professionalism measure. (See Table 2 in our unpublished supplement.)

⁶ We consider the elected branches to have primary responsibility unless the courts are formally charged with redistricting, or legislatures are operating under direct court order.

⁷ Cox and Morgenstern (1993, 1995) contend that operating expenditures should be measured per constituent rather than per member in order to reflect the resources available to legislators for casework. We concur that such a measure appropriately taps the potential for casework, but casework is just one of several avenues that highly professionalized legislators use to enhance their chances of reclection. For our purposes, a per-member measure is superior. (When we estimate our model using operating budget per constituent as the mdicator of professionalism, the results change from highly supportive of our hypotheses regarding professionalism to starkly inconsistent. [See Table 1 in our unpublished supplement.] Even the well-established result that as professionalism rises, so does the probability of reelection, is turned completely on its head when the per-constituent measure is used, with a finding that members of less professionalized legislatures have a better chance of being reelected. We believe this confirms our view that budget per constituent fails to tap well legislative professionalism as conceived in this study.)

⁸ The cases with professionalism scores at or near one are extreme outliers; the mean value of professionalism is .090, and the standard deviation is .115. Budgets for legislatures with biennial sessions vary enormously from one year to the next, and to make such budgets comparable to those for legislatures with annual sessions, we average the per-member budget during the year of the election and the same value during the previous year.

ContestPrev is a dummy variable indicating whether a legislator had an opponent in the previous election (1 = yes, 0 = no); when she did, $Margin_{t-1}$ is her margin of victory in that race (see Appendix A for details). EconCondit denotes national economic conditions. Following Kramer (1983) and Bloom and Price (1975), we operationalize economic conditions by the percentage change in real income per capita during the year before the election, adjusted for ease of interpretation (via linear transformation) so that zero represents the poorest observed conditions, and one denotes the best.9 To facilitate the specification of differential effects of economic conditions by party, we employ a dichotomous variable, NotPresParty, which indicates whether a legislator is from the party opposing the president (1 = yes, 0 = no).¹⁰

Coattail effects are specified using several variables. OwnPartyPresVote% equals zero if there is no presidential election in a given year; if there is, it equals the percentage of the two-party presidential vote received by the candidate's party in the state. OwnPartyGubVote% and OwnPartySenVote% refer to gubernatorial and senatorial elections and are defined similarly. PresElecYr (also GubElecYr and Sen-ElecYr) is a dummy variable that equals one if there is a presidential (gubernatorial/Senate) election in the year, zero otherwise. The effects of redistricting are modeled with three zero or one dummy variables. AfterRedist equals one for the first election following a statewide redistricting. OwnPartyRedist equals one for an election held in a district that was formed when a legislator's party had full control over the redistricting process. OppPartyRedist equals one if the district was established when the opposition party had complete control.

Finally, several dichotomous variables measure district electoral rules. Term length is measured by Term2Yr, which equals one if a legislator is serving a two-year term, zero for a four-year term. District type is measured by two variables. SMDist equals one if the incumbent is competing in a single-member district, zero otherwise; PostDist equals one if she is running in a post election, zero otherwise; incumbents from true MMDs are scored zero on both these dummies.¹¹

EMPIRICAL ANALYSIS

We estimated equation 1 using data for all major party state legislators competing in general elections between 1970 and 1989 for whom information is available

⁹ The comparison is based on the difference between third-quarter income data for the election year and the previous year.

from ICPSR (1992) (n=42,820).¹² In its original format, coding problems make this data set very difficult to use for testing our model. Individuals serving multiple terms are often identified differently across records (e.g., with and without middle initials, with and without nicknames), a problem compounded by numerous typographical errors. Thus, it is difficult to trace a particular legislator from election to election, which is essential for calculating margin of victory in the previous election. We "cleaned" this data set, establishing a common spelling for all names likely to indicate the same person.¹³

We employed two estimation strategies to deal with potential statistical problems relating to the pooling of observations across states. In one, we added a set of dummy variables for the states. In the other, we calculated Huber (robust) standard errors (White 1980). 14 The two estimations yielded nearly identical substantive conclusions. Although both models fit the data well, we report the results with state dummies because that model had a slightly better fit. 15 (Complete results for the alternative model are reported in Table 3 of the unpublished supplement.)

The estimates for the probit coefficients are reported in Appendix B. We have no direct interest in these coefficients, however, since they characterize the effects of independent variables on a hypothetical unbounded latent variable assumed to be measured by our observed (win/lose) binary variable (Aldrich and Nelson 1984). What interests us is the influence of independent variables on the probability that a legislator will win. Such effects can be estimated because the coefficient estimates in Appendix B can be used to compute the predicted probably of winning (and an associated confidence interval) for an incumbent legislator who had any combination of values for the independent variables (King, Tomz, and Wittenberg 2000). Then,

¹⁰ We restrict our sample to major party candidates. (Our replication data set [Berry, Berkman, and Schneiderman 2000] reports the full set of ICPSR party codes treated as Democrat and Republican.)

¹¹ Data sources for all variables are presented in Appendix A.

¹² We exclude Minnesota and Nebraska in those years m which they had nonpartisan legislatures because many of our hypotheses assume a partisan environment. We exclude Lousiana because its system of run-off elections results in no general election candidates in some districts in certain years.

¹³ We wrote several computer programs that implemented various algorithms for identifying when two similar but different names likely indicate the same person. The instances identified were then subject to visual screening by the authors and several graduate student assistants. To assess the success of our efforts, we took a random sample of 401 cases from those in the data set for incumbents competing in general elections. (Each case is a particular legislator in a particular year.) Of the legislators in our sample for whom there was at least one other observation in the data set, using "uncleaned" names, 35% had at least one instance in which their name was recorded differently. When "cleaned" names were used, the figure dropped to 6%.

¹⁴ We employed the *probit* procedure in *Stata* (version 6.0), specifying the state as the "cluster" variable.

is To measure fit, we used a procedure recommended by Beck, King, and Zeng (2000). It sorts observed legislators into "bins" based on their predicted probability of winning and then compares within bins the mean predicted probability of winning with the proportion of legislators who actually win. (See Document 1 in our unpublished supplement for details.)

for each independent variable, we can estimate the effect of that variable on the probability that an incumbent will be reelected by determining how much the probability of winning changes when the value of the variable is adjusted while all other independent variables are held constant at "central" or "typical" values. 16 By central values, we mean the mode for all dichotomous variables (except for the state dummies) and the average for all others.¹⁷ This means our "typical" legislator is competing for a two-year term, in a single-member district, in an election that does not follow a statewide redistricting; he is not of the president's party and is isolated from any coattail effects (due to the absence of any concurrent higher level elections). We compute all predicted probabilities assuming that a legislator is from what might loosely be termed the "median state" in our sample; by this we mean the state that has the median state dummy variable coefficient estimate (Vermont).

The estimates of effects derived from predicted probabilities are shown in Table 1.18 Column 1 presents probabilities of winning for legislators under various hypothetical conditions. Column 2 reports differences between probabilities for two legislators with different values on one independent variable—say, X—but the same value for the remaining variables; these probability differences measure the effect of X on the probability of winning. Finally, column 3 reports differences between two probability differences in column 2. These "differences of differences" are used to evaluate the support for hypotheses concerning interaction with legislative professionalism by assessing the extent to which the effect of a variable on the probability of winning varies depending on the level of professionalism.

In general, our model is well supported by the data. The only hypothesis that fails to receive any empirical support concerns district type (hypothesis 10). There is no evidence that legislators from SMDs have an easier time winning reelection than those running in post elections or MMDs. In fact, the predicted probability of victory is nearly identical in SMDs and post elections and just about .01 higher in MMDs. (To save space, we do not append to this assertion the phrase "when all other independent variables are fixed at 'central' values." All claims in this section about the response of one variable to a change in another are subject to this same condition.) Cox and Morgenstern (1995) found

that the advantage of incumbents running in SMDs over those competing in MMDs declined from the 1970s to the 1980s. When we modify our model to allow the effect of district type on the probability of winning to vary over time, we still find no appreciable influence of district type at any point during the period of analysis.¹⁹

We find support for hypothesis 11. Legislators serving two-year terms have a probability of winning that is .034 higher than those with four-year terms.²⁰ We also detect a redistricting effect: A party with complete control over redistricting seems to be able to use its power to bolster its members' chances of winning the next election. The members of such a party have a .029 higher probability of winning than legislators from the opposition party, which confirms hypothesis 12.

Our model permits us to assess the electoral implications of being unopposed in the previous election. A legislator without opposition in a given race has a .988 probability of winning her next race. She has a large advantage over a legislator who won his previous race by the barest majority, whose probability of winning is only .871. She even has a substantial advantage over someone whose previous margin of victory is at the median, who has a .946 probability of victory. Indeed, our probit results allow us to calculate the margin of victory that is the functional equivalent, in terms of a legislator's prospects in the next election, of having run unopposed previously. An incumbent who ran unopposed has the same probability of winning his next election as a candidate with a victory margin of .55 (e.g., someone who won a two-person contest 77.5% to 22.5%). Only when an incumbent's victory margin was overwhelming (i.e., greater than .55) is she better off than a legislator who ran unopposed. These results support hypothesis 1.

We now turn to our central hypotheses about the effects of legislative professionalism. Consistent with hypothesis 7, we find that for the typical state legislator an increase in the level of professionalism of his institution substantially increases his chances of reelection. When all other independent variables are held at central values, an increase in professionalism from its lowest value across states (.00) to a value two standard deviations above its mean (.32) yields an increase of .063 in the probability of winning. This suggests that members of highly professionalized legislatures are able to capitalize on the resources available to them to

¹⁶ In a probit model, the effect of each independent variable on the probabilities of the two outcomes varies depending on the values of all independent variables.

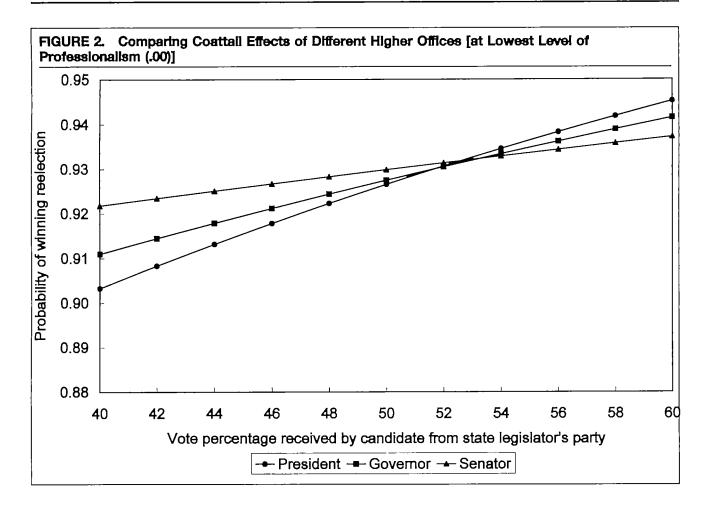

¹⁷ The central value is 0 for *PostDist*, *AfterRedist*, all election year dummies, and all coattail variables, 1 for *Term2Yr*, *SMDist*, *ContestPrev*, and *NotPresParty*, 090 for *Profess*; and .496 for *EconCondit*. *Margin* is skewed to the right, making the mean (.298) a somewhat deceptive measure of central tendency; thus, we treat the median (.228) as the central value.

¹⁸ There is extremely strong multicolinearity in the model; empirical tests showing that our results are insensitive to a variety of changes in model specification are summarized in Appendix A.

¹⁹ This is true whether we specify that the effect of district type interacts with (1) a year counter or (2) a dummy distinguishing the 1970s from the 1980s. (See tables 12 and 13 of the unpublished supplement.)

²⁰ In some social science applications, a probability difference of .034 would be considered very small. But bear in mind that incumbent defeats are extremely rare; 93% of legislators in our sample were reelected Thus, in a randomly selected group of 100 legislators, only 7 would be expected to lose. Our results imply that in a group of 100 legislators with four-year terms, 3 more are expected to lose than in a comparably sized group with two-year terms. Given the rarity of losses, this is a substantial difference.

lower their electoral vulnerability. But the effect of professionalism on the electoral success of incumbents proves to be much more pervasive. We find evidence that a high level of legislative professionalism insulates incumbents from the effects of higher level elections, economic conditions, and even their own historical weaknesses (as reflected in a low previous margin of victory). These results support our thesis: Legislative professionalization promotes the establishment of boundaries necessary for legislative institutionalization.

Let us consider our findings in greater detail. Not surprisingly, there is evidence that at any level of professionalism an incumbent's previous margin of victory is positively related with her chances of reelection (hypothesis 2). But, as hypothesis 9 suggests, the effect of previous margin declines substantially as the level of legislative professionalism rises. When professionalism is at its lowest value, an increase in previous victory margin from the narrowest possible to .40 increases the probability of winning by .127. But when professionalism is two standard deviations greater than the mean, the same increase in previous victory margin boosts the likelihood of winning just .054 (i.e., .072) less). At this high level of professionalism, even legislators who won their previous race by the barest of margins can overcome their historical weaknesses and win at a rate of 93.9%.

There is also strong support for our theory of coattails.21 Consistent with hypothesis 4, presidential coattails are the strongest, senatorial the weakest. Figure 2 provides greater detail than Table 1 by showing (for legislatures at the lowest level of professionalism) predicted probabilities that a state legislator will win across a range of higher office election outcomes, from 40% to 60%, for the legislator's party. The way the figure is constructed, the greater the slope of the curve associated with a higher office, the greater is the coattail effect of that office. The slope is greatest for presidential elections (for which an increase in party vote percentage from 40% to 60% yields an increase in the probability of victory of .043), just slightly weaker for gubernatorial races (for which the same increase in party vote percentage prompts an increase in winning probability of .031), and substantially weaker for senatorial contests (for which there is a probability increase of only .016).

The effect of legislative professionalism in buffering coattail effects, as predicted in hypothesis 8(a), is evident in Table 1. At the lowest level of professional-

²¹ There is just one inconsistency between our estimates in Table 1 and our hypotheses about coattails. Contrary to hypothesis 3, at a sufficiently high level of legislative professionalism, the effect of a senatorial election outcome on the outcome of a state legislative race drops to zero and then becomes negative as professionalism rises.

ism, an increase in presidential candidate support from 40% to 60% results in an increase in the probability of winning of .043. When professionalism is two standard deviations greater than the mean, an identical increase in presidential candidate support leads to an increase of only .004 in the probability of winning, for a difference in the amount of increase of .039. The comparable difference in increase is smaller, but still appreciable, for both gubernatorial races (.021) and Senate contests (.017) (see column 3 of Table 1).²²

We also find support for the hypothesized effects of economic conditions. Figure 3 shows for legislators of both the president's party and the opposition, and for those in both low- and high-professionalism contexts, how the probability of winning changes as economic conditions improve from their lowest value (.00) to their highest (1.00). The strong empirical support for our hypotheses about the effects of economic conditions is evident from the similarity of the graphs in figures 1 and 3.

At both levels of professionalism, when economic conditions are at their worst, legislators of the presi-

dent's party have a lower probability of reelection than legislators from the opposition party (hypothesis 6[i]). Consistent with hypothesis 5, however, a strengthening of the economy increases the probability of winning for legislators of the president's party and decreases the probability of victory for candidates from the opposition. And at both levels of professionalism, when economic conditions improve from worst to best, the resulting increase in reelection probability for a member of the presidential party (.117 in the low professionalism context, .057 with high professionalism) exceeds the magnitude of the resulting decrease in probability for a member of the opposition (.061 for low professionalism, .013 with high professionalism). This confirms hypothesis 5(ii): The effect of economic conditions on the probability of election success is stronger for members of the president's party than members of the opposition. This result is consistent with our differential responsibility model of economic voting, which assumes challengers from the president's party are held responsible for economic conditions by voters, but to a lesser degree than incumbents of that party. The result is inconsistent with both the dominant model in the voting literature, which suggests that such challengers share fully in the credit or blame given the presidential party, and Hibbing and Alford's (1981) model, which presumes that challengers are not held responsible at all.

Finally, for legislators from either the president's party or the opposition, the effect of economic conditions is dramatically weakened by a high level of

²² Ideally, the coattail variables should be based on the vote shares received by higher office candidates in the state legislator's district. Since those data are not available, we use statewide vote shares, which should tend to diminish estimated coattail effects in states where vote shares for higher level elections vary substantially across legislative districts. We would expect this in larger, more heterogeneous states. Since such states also tend to have more professional-need legislatures, our finding that coattail effects weaken with a rise in professionalism could partially be due to our use of state-level vote shares.

professionalism, which is consistent with hypothesis 8(b). This is evident in the differing slopes of the curves in Figure 3 and in the pattern of predicted probabilities in Table 1. For example, for members of the presidential party, an improvement in economic conditions from worst to best increases the probability of winning by .117 in the low professionalism context but by only .057 in the high professionalism context, a difference of .060. The comparable difference for members of the opposition is a similar .048.23

CONCLUSION

The large sample allowed us to test many extant hypotheses about legislative elections and to control for a wider range of variables than has been possible in previous research. We confirm Carey, Niemi, and Powell's (2000) finding that state legislators with shorter rather than longer terms are more likely to win reelection. We also corroborate several results observed primarily in studies of Congress. We find that control over redistricting allows a party to help its incumbents win reelection, although the advantage gained is not huge. We confirm, too, the importance of the historical strength of an incumbent: The margin of victory in the previous race has a strong influence on the probability of reelection. Indeed, we go even farther and establish that incumbents who are challenged and win big (i.e., by a margin greater than .55) have better electoral prospects than those who are not challenged at all.

Our research clarifies several lingering issues in the legislative elections literature. We now have a much clearer sense of the relative effects of different higher office elections: Presidential coattails are longest, followed by gubernatorial and then senatorial. We also see that the effects of economic conditions are not as straightforward as suggested by either the responsible party model or the restricted in-party culpability theory. Consistent with our differential responsibility model, voters hold challengers from the president's party responsible for economic conditions, but to a smaller extent than the party's incumbents.24

Most critically, our research shows in great detail

23 As stated in note 4, the estimated coefficient for the margin variable may capture some effect of the excluded variable, historical party strength. Furthermore, we acknowledge in note 22 that the interaction detected between the coattail variables and level of professionalism may be spurious due to our need to measure coattails with state-level vote shares. It is, therefore, comforting that there is strong empirical support for our hypothesis that the effect of economic conditions on the probability of winning weakens as level of professionalism increases. If our general argument about the buffering effect of professionalism (i.e., hypothesis 8) were wrong, and if we had found that coattails and previous margin interact with level of professionalism only because of measurement and specification errors, we would not expect to find that the effect of economic conditions on the probability of incumbent victory declines as professionalism rises.

²⁴ We can draw conclusions about challengers from the president's party without observing them directly because the competing hypotheses about the effects of economic conditions on such challengers predict different effects of economic conditions on the probability of reelection of incumbents from the opposition party, and these effects

can be estimated using our data (see page 4).

how legislative resources alter the dynamics of legislative elections. Members of highly professionalized legislatures have a greater probability of winning than members of less professionalized bodies. Moreover, a high level of professionalism buffers incumbents from external political forces and the effects of national economic conditions. Consider a year in which an incumbent Democratic president presiding over a strong economy wins reelection by a landslide. Because national forces strongly favor his party, Democratic incumbents will hold a distinct advantage over Republican incumbents in an unprofessionalized state legislature, and we can expect a substantially larger percentage of Republicans to lose. In highly professionalized legislatures, however, Democratic incumbents will have significantly less advantage over their Republican colleagues, because members of both parties are insulated from national forces and have a high probability of victory. We find that professionalism even helps protect incumbents from their own historical weaknesses by reducing the effect of their previous margin of victory on the probability of their reelection.

By identifying clearly the buffering role of legislative professionalism, our findings speak directly to a large literature on congressional elections that finds the effect of national forces, including both coattails and the economy, has weakened over time. The relatively limited number of congressional elections makes it difficult to confirm a causal link between legislative resources and this weakening, but our large data set shows that an increase in state legislative resources does mitigate the effects of both coattails and economic conditions on election outcomes. Our results strongly suggest that the declining influence of national forces on congressional elections has been caused by increases in congressional resources.

By conceiving of professionalism as a critical contextual variable, we contribute to the development of a general theory of American legislative election outcomes that can explain both congressional and state races. As legislatures professionalize, the relationships between members and the external environment changes: Elections are less likely to be affected by political and economic conditions outside incumbents' control. Thus, professionalism makes possible the development of boundaries that protect the membership from external shocks and changes. These boundaries are an essential element of legislative institutionalization.

These results offer strong but conditional support for Salmore and Salmore's (1993) contention that state elections have become more like congressional ones; we find that this is the case only when state legislatures are more professional and therefore look more like the Congress. For those state legislatures that continue to professionalize, we can expect further decline in the influence of national forces over state legislative elections, so that these will look even more like congressional elections.

On the surface, this projection may seem at odds with claims by Brace and Ward (1999) and Rosenthal (1998) that state legislatures are deinstitutionalizing.²⁵

²⁵ Some of what these authors call demstitutionalization (e.g., reduc-

Our findings imply, however, only that if legislative professionalism rises and all other factors influencing the level of institutionalization remain constant, the level of institutionalization will increase as legislative boundaries strengthen. In fact, certain forces are contributing to lower levels of professionalism in some state legislatures. In particular, citizens have imposed legislative deprofessionalization in some states via initiatives that limit legislative resources. For example, citizens in several states voted in the 1990s to restrict the length of legislative sessions, and in California Proposition 140 cut the legislature's budget and staff (Rosenthal 1998). Anti-institutional sentiment among citizens combined with the availability of the voter initiative in some states has reduced the level of legislative professionalism.

This same sentiment has led to voter-imposed term limits in some states, which directly contribute to legislative deinstitutionalization in several ways. First, virtually by definition, they weaken legislative boundaries by shrinking the probability of reelection to zero for some. Second, they reduce the attractiveness of a legislative seat to career-oriented politicians, thereby lowering the stake legislators have in erecting the boundaries that shield them from external political and economic shocks. Finally, we contend that, even in the absence of term limits, the mere existence of the initiative option weakens the boundaries of legislatures in some states by allowing the external environment to intrude in ways over which legislators have virtually no control. In these states, constitutional rules may make it impossible for the legislature to maintain strong boundaries in the face of anti-institutional sentiment among the public.

APPENDIX A

Operational Definition of Margin of Victory

A legislator's margin of victory (Margin) is based on the difference between his vote share and that received by the losing candidate with the most support in the district. In SMDs the margin is measured in the traditional manner: the proportion of the vote the winner receives minus the proportion garnered by the second-place candidate. (We treat districts that are multimember with positions as if they were SMDs because each candidate is competing for a single designated seat.) In true MMDs, Margon = (A - B)/(C/D), where A = the number of votes received by the legislator, B = the number of votes received by the losing candidate with the most votes, C = the total number of votes cast in the district's election, and D = the number of seats selected in the district. In effect, margin of victory in MMDs measures how "badly" an incumbent beat the strongest losing candidate, relative to the average number of votes cast for a seat in the district. Thus, in either a SMD or a MMD, Margon can be viewed as an indicator of how close a legislator came to losing.

Data Sources

tions in legislative salaries) we would describe as deprofessionalization. Of course, our theory would predict that deprofessionalization causes deinstitutionalization. **Profess.** Legislative budgets from State Government Finances, selected years. Number of members in legislatures from Book of the States, selected years. Nominal budgets converted to 1967 dollars using the Consumer Price Index for all urban consumers (U.S./all items), series CUUR000AAU, taken from the site: http://stats.bls.gov/cgi-bin/surveymost.

ContestPrev. Constructed from variable 17 from ICPSR (1992).

Margin. For candidates running in SMDs, variable 28 from ICPSR (1992). For those in MMDs, constructed from data in ICPSR (1992) as described above.

OwnPartyPresVote%, OwnPartyGubVote%, and OwnPartySen-Vote%. Scammon (1995). (For Vermont in 1968 and Virginia in 1973, we assume OwnPartySenVote% = 50 to make for a "neutral" coattail effect. In Vermont, the winning candidate had the nomination of both major parties. In Virginia, although there was no Democrat in the race, both the Republican and independent candidates had been Democrats.)

EconCondit. Real income in 1987 constant dollars from Survey of Current Business, September 1994, Volume 74, no. 9; population from 1995 Statistical Abstract of the United States.

NotPresParty. Constructed from variable 14 from ICPSR (1992) (see note 10).

AfterRedist, OwnPartyRedist, and OppPartyRedist. Information about redistricting in the 1960s and 1970s is from Book of the States (various years), Bushnell (1970), and Hardy, Heslop, and Anderson (1981); information about the 1980s is from Basehart and Comer (1991) and a table titled "1980s Redistricting Authority" based on a 1985 National Conference of State Legislatures (NCSL) survey provided by Tim Storey of NCSL on June 13, 1997. (See our replication data set for details about construction of these variables.)

SMDist, PostDist. Constructed from variable 10 from ICPSR (1992).

Model Specification and Multicolinearity

The presence in the model of numerous multiplicative terms involving legislative professionalism leads to very strong multicolinearity: Regressing Profess on the remaining independent variables in equation 1 yields an R^2 in excess of .99. Were it not for the huge sample size, this degree of multicolinearity undoubtedly would be crippling. Despite the multicolinearity, our results prove robust with regard to changes in model specification. There are three interactions involving professionalism in equation 1, with previous margin of victory, coattail effects, and economic conditions. We estimated equation 1 dropping all combinations of two of the three interactions at a time, so that only one interactive effect was specified, and all other effects were assumed additive. These "submodels" faced less severe colinearity and generated coefficient estimates with lower standard errors. But the coefficient estimates for the submodels consistently led to substantive conclusions about the interaction specified that are very similar to those based on the full model. (See tables 5, 6, and 7 in our unpublished supplement.)

To see whether our results were sensitive to the precise functional form of the interactions concerning legislative professionalism in equation 1, we estimated four additional models, each with a "second-order" product term involving the square of the professionalism variable: (ContestPrev) (Margin)(Profess²), (OwnPartyPresVote%)(Profess²), (OwnParty

GubVote%)(Profess²), or (OwnPartySenVote%)(Profess²). These allow the effects of previous victory margin and the coattail variables on a latent variable assumed to be measured by the win/lose dichotomy to vary nonlinearly with the level of professionalism. (Equation 1 constrains the effects of these variables to vary linearly with professionalism.) The conclusions about our hypotheses remain virtually unchanged in all four alternative specifications. (See tables 8 through 11 of our unpublished supplement.)

Xenophon's Philosophic Odyssey: On the *Anabasis* and Plato's *Republic* JACOB HOWLAND *University of Tulsa*

enophon's Anabasis, a military adventure interwoven with a story of philosophical self-discovery, is a companion piece to Plato's Republic. The Anabasis takes up in deed the two great political problems treated in speech in the Republic, namely, how a just community can come into being and how philosophy and political power may be brought to coincide. In addressing the first of these problems, Xenophon makes explicit a lesson about the limits of politics that is implicit in the Republic. He speaks to the second problem by clarifying the essential role of philosophical eros in his emergence, at the moment of crisis, as the founder and leader of a well-ordered community. Xenophon's self-presentation in the Anabasis, which makes clear his debt to Socrates, illuminates the nature of philosophical courage as well as the saving

Tt is safe to say that the name of Xenophon was much more well known to earlier generations of readers than it is to our own. In antiquity, Xenophon was widely admired as a man of considerable parts, whose virtues of intellect and character were displayed in a noble harmony of speech and deed. Romans and Greeks alike regarded him as an exemplary warrior, a model of political leadership, an eloquent orator, and an inspired author. Xenophon's abilities as a political thinker and leader were also quickly recognized when the study of Greek was revived in Europe at the end of the Middle Ages (Dakyns 1890, xl).

integrity of the philosophical soul.

Xenophon's reputation stemmed largely from the events related in the Anabasis, a tale of courage and endurance that did not fail to impress the most ambitious individuals of later ages. The Greek historian Polybius, writing in the second century B.C.E., suggests that Alexander's expedition into Asia never would have occurred apart from the example of the successful retreat of the Ten Thousand from Persia.1 Plutarch (1968) records that when Mark Antony's army was suffering from famine, fatigue, and sickness on campaign against the Parthians, "Antony, they say, often uttered 'O the Ten Thousand!' in amazement at those who were with Xenophon" (Antony 45.6). Dio Chrysostum (1950), a Greek author of the first century C.E., goes so far as to recommend Xenophon to aspiring orators on the ground that he "alone among the ancients, is able to suffice for a political man" (Discourse 18.14). Dio praises Xenophon's speeches in the Anabasis for their hortatory power, prudence (phronesis), and cunning, and he notes that the persuasiveness of his words derives from his "not having learned from hearing, nor having imitated others, but having done deeds as well as talked about them" (Discourse 18.17). The philosophical statesman Cicero (1952) and the orator Quintilian (1954) were no less impressed with Xenophon's mastery of the written word. The former calls his style "sweeter than honey" and records that "the Muses were said to speak with the voice of Xenophon" (Cicero, Orator 9.32, 19.62); the latter observes that "the Graces themselves seem to have molded his style . . . [and] the goddess of persuasion sat upon his lips" (Quintilian, Institutio Oratoria 10.1.82).²

Niccolò Machiavelli and Francis Bacon held Xenophon in similarly high esteem. Machiavelli seems to have regarded him as the wisest of the ancients with respect to the political things. It has been observed that he "mentions Xenophon in the Principe and the Discorsi more frequently than he does Plato, Aristotle, and Cicero taken together"; what is more, Xenophon's Education of Cyrus is the only book cited by name in the Prince (Strauss 1991, 103, n. 3; Nadon 1996, 361, n. 3). For his part, Bacon ([1859] 1963) holds up "Xenophon the philosopher" as a prime example, alongside Alexander and Caesar, of "the concurrence of military virtue and learning." He marvels at Xenophon's sudden transition during the march of the Ten Thousand from being an object of "scorn" to one of "wonder," and he concurs with the judgment of the ancient historians that Alexander's achievements rested "upon the ground of the act of that young scholar" (Bacon [1859] 1963, 313–4).3

After the Renaissance, the *Anabasis* became the primary text for beginning Greek students, and an Oxford professor writing as recently as 1949 found no need to review the story of the Ten Thousand because the *Anabasis* "has been read by generations of British schoolboys" (Howell 1949, 3). Such a claim could hardly be made today. Xenophon also is not read in translation as a matter of course by students of classical philosophy and political theory, perhaps because his writings meet the disciplinary expectations of the modern academy less clearly than those of other ancient authors (Wood 1964, 37–40). The virtues for which

Jacob Howland is Associate Professor of Philosophy, Department of Philosophy and Religion, University of Tulsa, Tulsa, OK 74104-3189 (jacob-howland@utulsa.edu).

I am deeply grateful to Ada Fmifter for her patience and professionalism, to the anonymous referees of *APSR* for their excellent critical suggestions, and to the students in my 1998 Xenophon seminar.

¹ Polybrus 1993, *The Histories* 3.6.9-11. See the comparison of Xenophon and Alexander in Arrian, *Anabasis of Alexander* 1 12.2-4. Against all odds, Xenophon led roughly ten thousand mercenaries back to Greece from the heart of Persia after the army failed to overthrow Emperor Artaxerxes.

² A detailed discussion of the classical critical tradition with regard to Xenophon is provided in Dakyns 1890, xvii—xvii.

³ Xenophon was probably a little less than thirty years old when he joined the expedition of Cyrus (Mather and Hewitt 1962, 23).

Xenophon was held in high esteem by the most discerning ancient and early modern students of politics have escaped the notice of most contemporary academicians (but see Strauss 1970, 1972, 1975, 1991). Recent interest in the Education of Cyrus suggests that the tide may be beginning to turn, but much of the new scholarship is marred by inattention to the "cutting nuances and subtlety" of Xenophon's writing (Nadon 1996, 362). The Anabasis, in any case, continues to be neglected by philosophers and political theorists alike. Thoughtful readers of this forgotten masterpiece will agree that "Xenophon is ripe for rehabilitation" (Goldhill 1998).

This article is rooted in the conviction that the Anabasis deserves to be rediscovered as a literary and philosophical classic. Xenophon invites the reader to join him in a voyage of philosophical self-discovery, the shape and meaning of which emerges most clearly when the *Anabasis* is studied as a companion piece to Plato's Republic. This approach, which to my knowledge has not been explored, is suggested by the recognition that Xenophon's text recapitulates the central themes and issues of Plato's most well-known dialogue. The parallels between the two works are further enriched by the use of Homer's Odyssey as a subtext in both. All three of these texts tell the story of a homecoming of the soul as well as the body, a homecoming that unfolds on an intellectual and metaphysical level as well as the literal level of physical reality. Although Xenophon's narrative also converses with the History of Herodotus, Aeschylus' Persians, and the *Iliad*, a full exploration of his literary debts is impossible in the present context. I propose instead to follow the most direct route into the meaning of the Anabasis, a route marked out by Plato's Republic.

The Anabasis is on one level the story of a military adventure that accidentally assumes the characteristics of the Republic's main theme: the creation of the good city. Xenophon takes up in deed the two great political problems treated in speech by Plato, namely, how a just polity can come into being and how philosophy and political power may be brought to coincide. Xenophon addresses the first problem by showing us the conditions for the emergence of an actual community, the retreating Ten Thousand, that is as nearly well ordered as a political community can be. But a well-ordered community is not necessarily a genuinely just community, such as the Republic's Kallipolis aspires to be, that is, a community in which devotion to the common good springs from the intrinsic virtue of its members. Xenophon makes it clear that the ephemeral unity of the Ten Thousand is rooted in nothing other than the urgent need for self-defense against external enemies; when this urgency fades, order inevitably gives way to factional strife. In explicating the fragility of order among the Ten Thousand, the absence of a common good that transcends self-defense, and thus the attenuated sense in which even this extraordinary political body exemplifies justice, the *Anabasis* makes explicit a lesson about the limits of politics that is implicit in the Republic. Yet, this lesson takes shape differently in each text. Plato's Socrates seems to be aware of the

limits of politics from the moment he proposes to found a city in speech, but Xenophon learns of them only through harsh experience and as a result of the actual outcome of events. His experiences, however, lead him to define these limits more sharply than Socrates does. In particular, the *Anabasis* repeatedly underscores the difference, and indeed the tension, between political order and justice, a theme only indirectly visible in the *Republic*.

The Anabasis is also, and most significantly, the story of Xenophon's intellectual and moral growth. It traces the path of his personal appropriation of the wisdom of Socrates, whom Xenophon leaves behind in Athens when he joins the expedition of Cyrus (Anabasis 3.1.4-7).4 It is furthermore in terms of his manifestation of Socratic or philosophical courage that we must understand Xenophon's response to the second great problem treated by Plato. At the center of the Republic, one encounters a seemingly intractable opposition between eros and thumos, or philosophical passion and spiritedness (especially as evinced in anger, and in the pursuit of honor and victory [Republic 586c-d]). Socrates invites us to ponder the relationship of these two dimensions of the soul when he makes it clear that the genuine philosopher will not wish to rule and, conversely, that the type of person who is attracted to ruling offices will not be inclined to philosophize. The Anabasis speaks to this problem by clarifying the critical role of philosophical passion in Xenophon's emergence as the founder and leader of a well-ordered community. Xenophon presents himself as a timely, and therefore admittedly temporary, solution to the problem of the relationship between philosophy and politics. The key to this solution lies in the fact that Xenophon's spiritedness, far from asserting itself as potentially antiphilosophical thumos, is indistinguishable from the energy intrinsic to philosophical eros. The power of the latter to overcome the partiality of thumos and to unify the soul is accordingly a central theme of Xenophon's self-presentation in the Anabasis. Xenophon emphasizes that his philosophical disposition graces his soul with a saving integrity. His political and military success is nevertheless merely the penultimate stage in this odyssey of self-discovery. His ultimate achievement of Socratic self-knowledge follows the decay of the community of the Ten Thousand and is anticipated by his eventual decision to exchange the seductions of military and political activity for the deeper pleasures of quiet reflection.

XENOPHON AND PLATO

A few preliminary observations about the relationship between Xenophon and Plato are in order. First, the existence of a Symposium and an Apology of Socrates in the corpus of both Xenophon and Plato constitutes prima facie evidence that these authors were acquainted with each other's writings. Ancient commentators took it for granted that this was the case. One

⁴ Unless another title is indicated, all subsequent citations are to book, chapter, and section numbers of the *Arabasis*.

ancient tradition holds that Xenophon wrote the Cyropaedia in response to the first books of the Republic; another maintains that the Athenian Stranger's remarks about Cyrus in Plato's Laws (694a-695b) were meant as a criticism of the Cyropaedia (Diogenes Laertius 1991, Lives of Eminent Philosophers 3.34; Aulus Gellius 1952, Attic Nights 14.3.3-4).

Second, the core of my argument is largely independent of chronological considerations. My thesis that the *Republic* and the *Anabasis* are companion pieces need not rest upon the assumption that the former was the earlier work. For example, Plato may have added passages to the *Republic*, or otherwise revised it, in the light of his reading of the *Anabasis*. It is less likely that Plato began to write the *Republic* after reading the *Anabasis*. Even so, both works can be viewed as variations on a common set of themes and issues, as meditations that are best appreciated in tandem, just insofar as one of them takes the measure of the other.⁵

Finally, although Xenophon's ancient readers do not explicitly link the *Anabasis* with the *Republic* as they do the *Cyropaedia*, the plausibility of such a connection is strengthened by the fact that all three works are essentially concerned with war, tyranny, and especially the relationship between erôs and thumos. Indeed, the latter problem stands, both literally and thematically, at the center of the *Cyropaedia* as well as the *Republic*.

The third "wave of paradox" of book 5 of the Republic, according to which political power and philosophy must coincide, breaks at the exact center of the text (Howland 1998, 633). This is said to be the "biggest and most difficult" of the three waves of paradox (Republic 472a4), presumably because it demands a reconciliation of a range of humanly fundamental oppositions, including those between spiritedness and erotic love, the longing for honor and the longing for wisdom, public welfare and private affection, the political production of civic order and the philosophical discovery of truth. Prior to the third wave's introduction of philosopher-kings, the city in speech is distinguished by the suppression of erôs and the rule of well-tempered thumos. Thus, the essential qualification for rule in books 3 and 4 is political (as opposed to philosophical) courage—steadfastness in preserving "right opinion" (orthe doxa), particularly the conviction (dogma) that one must do what is best for the city (cf. 412c-e with 429d-430c). Immediately after the third wave, however, the theme of erôs explodes into the dialogue: The philosopher is essentially characterized by an erotic passion for the whole of truth and wisdom, a passion that Socrates describes by borrowing the language of sexual attraction and consummation (474d-476d, 485a-b, 490a-b). The rulers of the just city must somehow overcome the oppositions that

come to a head in the third wave; they must, as Socrates says, be "best in philosophy and with respect to war" (543a5-6, emphasis added).

Similarly, Xenophon introduces the tension between thumos and erôs at the literal center of the Cyropaedia when he acquaints us (at the very end of book 4 and the beginning of book 5, in a text comprising eight books) with the character of Panthea, by reputation the most beautiful woman in Asia. Cyrus, whose governing desire is to rule a great empire, refuses even to gaze upon Panthea because he fears becoming a slave to erotic attraction (Cyropaedia 5.1.8, 12, 16). He wishes to avoid such slavery, in spite of its attendant pleasures, because it would prove fatal to his political ambitions. In Cyrus's view, erôs and thumos cannot cooperate within the soul: One must always be the absolute master of the other. Cyrus's manly pursuit of victory and honor therefore requires his utter rejection of the charms of beauty.

The story of Cyrus and Panthea dramatizes the issue at the heart of the problem of philosophical rule. The meaning of this story becomes clear when it is considered with a view toward the erotic philosopher of the Republic—to say nothing of a similar episode in Xenophon's Memorabilia (3.11), wherein Socrates, when told of the beauty of the courtesan Theodote, rushes off to see her. By turning a blind eye to beauty and a deaf ear to what he regards as the siren-song of erôs, Cyrus renders himself impervious to the educative power of music, which has everything to do with "love matters [erôtika] that concern the fair" (Republic 403c6-7), and so to philosophical music in particular. If this suggestion is well taken, then the Athenian Stranger's criticism that Cyrus "failed completely to grasp what is a correct education" (Plato, Laws 694c6-7) turns out to be one that Xenophon hopes thoughtful readers will have understood on their own.

THE REPUBLIC: POLITICS IN SPEECH

The Republic is narrated by Socrates and starts with a physical journey. Its first word is "I went down" (kateben). Katabasis, the noun meaning "going down," is the opposite of anabasis, or "going up"; the latter term refers specifically to a journey inland from the sea, or up country. The Piraeus, to which Socrates went down "yesterday" with Glaucon in order to observe the festival of Bendis (and from which presumably he has returned as of "today"), is the port of Athens. According to Socrates, his anabasis—his attempt to go back up to Athens from the sea—is interrupted by Polemarchus (Republic 327c-328b), and he ends up spending all night in the Piraeus in philosophical conversation with some young men. In the place of a literal ascent in deed, the Republic provides an ascent in speech to the just city and to the highest objects of philosophical inquiry, namely, the Ideas and the Good. In the course of this ascent, there is furthermore much talk of going down and going up. The theme of ascent and descent appears in the myth of Gyges' ring in book 2, in the famous cave image of education in book 7, and in the myth of Er in book 10, in which Er goes down to Hades

⁵ Xenophon's use of the imperfect tense at 5.3.7–10 indicates that at least this portion of the text was written after his expulsion from Scillos (Dakyns 1890, kvi, cxxxi). It is thus reasonably certain that Xenophon was still working on the *Anabasis* after 371 (Dillery 1995, 59 with 264, n. 1) According to the standard view of Platonic chronology, this means that Xenophon was still working on the *Anabasis* after the *Republic* was in all likelihood complete (Guthrie 1987, 437; Ross 1951, 2; but see the criticisms in Howland 1991).

and then returns to the land of the living. Finally, the theme of ascent and descent is reflected in the shuttling, dialectical movement of philosophy as depicted in the Divided Line—movement up to the Ideas and the Good and back down to concrete conclusions (*Republic* 511b-c).

As can be seen from the preceding list, the image of physical descent and ascent is meant to suggest motion on the level of the soul. It is in terms of this motion that we must understand both Socrates' katabasis at the beginning of the Republic and the action of the dialogue as a whole. Plato makes it clear that the Republic is a philosophical epic in which Socrates struggles to rescue his companions from a kind of living death, the condition of the unexamined life, within the horizons of which the practice of tyrannical injustice, whether open or disguised, seems indispensable to supreme happiness (344a, 362a-c). To begin with, the dramatic setting of the dialogue in the home of Cephalus in the Piraeus leaves little doubt that we are initially, as Eva Brann writes, "in the city of shades, the house of Pluto": in the name Piraeus (especially in the accusative phrase eis Pevaia, which Socrates employs in the first line of the dialogue) one hears peraia or "beyond-land"; Bendis is a deity of the underworld; and one ancient source indicates that Cephalus, who is said to be on the threshold of death (Republic 328e6), actually died at least twenty years before 421, the earliest dramatic date most scholars are willing to assign to the Republic (Brann 1989-90, 8-9). Furthermore, the dialogue takes place under a cloud of war and imminent tyrannical violence. Three of the ten characters who appear in the Republic—Polemarchus, Niceratus, and Cleitophon-will be murdered by the Thirty Tyrants who seize power in Athens in 404 (Krentz 1982, 79-81; Rahe 1977, 198).

Yet, although the conversation begins in the city of shades, it concludes with a return to light and life. The myth of Er ends when Er awakens on his funeral pyre at dawn (Republic 621b); as it happens, it is probably around dawn when Socrates finishes telling Er's tale at the very end of the Republic. The journey traced by the sun in the background of the dialogue as it moves below, and ultimately reemerges from beneath, the earth's surface seems to be a cosmic analogue of the movement of philosophy itself (Rosenstock 1983, 220-1). What is more, this imagistic depiction of education as the ascent of the soul from the land of the dead to the land of the living, from darkness to light, and from confusion to clarity, is well established by the time of Plato. It is the basic structure of the Greek religious rites of mystery initiation, such as those practiced at Eleusis (Burkert 1983, 248-97). It appears in Parmenides' famous philosophical poem, written perhaps fifty years before the birth of Plato. Most important, it is reflected in the Odyssey, in which Odysseus passes beyond the boundary of death and, renewed by ultimate wisdom, returns to the land of the living.6

THE ANABASIS: POLITICS IN DEED

The Anabasis, too, narrates a circular journey.⁷ As in the Republic, the motif of homecoming in the Anabasis is intertwined with the themes of a descent toward literal and spiritual death and a political and philosophical ascent. With regard to political matters, the plan of composition in the Anabasis is as follows: in books 1, 2, and 3, increasing danger and ascent from everyday political reality to the well-ordered regime; in book 4, the perfected warrior-community of the Ten Thousand; in books 5, 6, and 7, return to safety and descent from the well-ordered regime to everyday political reality. With regard to Xenophon's personal odyssey, the Anabasis describes an ascent toward self-knowledge. Let us now consider the shape of the Anabasis in more detail.

The full title of Xenophon's book is Kurou Anabasis, or Ascent of Cyrus; its subject is not Cyrus the Great, whose story is told in the Cyropaedia, but Cyrus the Younger. The title obviously has political overtones. Cyrus had hoped that his march up country to do battle with his older brother Artaxerxes, who succeeded Darius in 405, would conclude with his ascent to the Persian throne. The geographical going-up of Cyrus and his army of Persians and Greek mercenaries turned out to be a moral, political, and psychological going-down: Cyrus was killed at the battle of Cunaxa in 401; the Persians in his force abandoned the Greeks and went over to Artaxarxes; and the five main Greek commanders (including Clearchus, Proxenus, and Meno), together with twenty other officers, were murdered shortly thereafter through the treachery of the Persian commander Tissaphernes. The leaderless Ten Thousand found themselves surrounded by a vast army in the heart of enemy territory, an enemy whose hostility was intensified by two invasions of Hellas during the preceding century that ended in humiliating defeat at the hands of the Greeks. Xenophon and the Greek mercenaries had followed Cyrus straight down, so to speak, into a living hell. All of this is accomplished in the first two books of the *Anabasis*.

Tyranny

The Greeks are not, however, simply victims of circumstance. Xenophon makes it clear that the mercenary disunity of the army played an essential role in bringing about the extraordinarily dangerous situation faced at the end of book 2, and this disunity must in turn be understood in relation to the theme of tyranny. This point emerges most clearly when the *Anabasis* is compared with the *Republic*. Both books begin with the

wander about in a kind of moral and intellectual no-man's-land (Howland 1993, which develops Sogal 1978, cf. Lachterman 1990). The structure of the *Republic* also recapitulates that of the *Odyssey* in certain essential respects; see Howland 1993, 47–54.

Socrates is depicted in the Republic as a philosophical Odysseus: He attempts a homecoming of souls that have been blown off course by the stormy winds of appetite and ignorance and that consequently

⁷ Lossau (1990, 51) notes that the *Anabasis* relates a journey that begins and ends in the vicinity of Sardis, and the last words of the book, "Thibron . . . went to war against Tissaphernes and Pharnabazus" (7.8.24), recall the pretext of making war against Tissaphernes that Cyrus used to collect his army at the very beginning of the work (1.1.6).

orienting assumption that the tyrant (or the Persian equivalent, the oriental despot) is the happiest of men.⁸ This assumption is in the first place made by Cyrus, whom Xenophon represents as exercising absolute power and acting with license. Like the possessor of Gyges' ring, Cyrus sleeps with a married queen, takes what he wishes through violence, and puts to death whomever he wants (1.2.12, 19-20). As if to underscore what is revealed in these deeds, Xenophon quietly alludes to two myths that caution against hubris—the flaying of the satyr Marsyas by Apollo and the story of Midas—just before and just after mentioning that Cyrus was said to have slept with the Cilician queen (1.2.8, 13-14; on the greed of Midas, cf. Aristotle, Politics 1257b). Such allusions would find a receptive audience among Athenian readers, whose understanding of the Persians was decisively shaped by Aeschylus' depiction of Salamis and Plataea as the outcome of hubris nurtured by tyranny and luxury (Persians 800-42). Xenophon deliberately builds upon Aeschylus' politically foundational muthos, within which Greek freedom and independence come to light as the antithesis of the Persian character.9 By making it clear in his "eulogy" that Cyrus's tyrannical character was an outcome of his education (1.9), Xenophon in fact criticizes the Persian political culture as a whole.¹⁰

If Cyrus believes that tyranny is the most desirable life, he also supposes that the summit of tyrannical power, and so the apex of happiness, is achieved by the Persian emperor. To judge by its frequent appearance in the dialogues of Plato, this assumption is a commonplace in the Greek cities as well (Sophist 230d-e; Gorgias 470c; Apology 40d-e). For their part, the Greek mercenaries who join Cyrus's expedition suppose that the best things in life may come from being useful to a tyrant. Not surprisingly, in the first part of the Anabasis the Greeks act like nothing so much as a band of thieves. The army is a nest of quarreling factions, divided according to the home cities of the soldiers, and is composed of the kind of men who are ready to stone their own commanders when it seems to suit their self-interest (cf. 1.5.11-7 with 1.3.1-2).11 In these respects, the situation at the beginning of the Anabasis reminds one of the quarrelsome condition of the Greek army at the beginning of the Iliad. By the

same token, the obedience of the men in book 1—like that of the Achaean soldiers in Homer's *Iliad*—is won not by an appeal to the common good but by promises of increased personal wealth or power and by harsh discipline (or the threat thereof).¹²

In certain respects, Xenophon suggests, the army begins to undergo a transformation after Cyrus's death at the end of the first book. Yet, he also makes it clear that the army remains fragmented in a way that leads directly to even greater danger. Before Cyrus's death, the army functions simply as a mercenary band; its goal is determined by Cyrus, in whose pay it labors. After Cyrus's death, it can no longer function in the same way, for it is no longer in the employ of anyone. Unlike other armies in normal conditions, including those made up of citizen-soldiers, the Greek soldiers are now entirely independent and must henceforth determine their own goals. They are in this sense "a city on the move" (Cawkwell 1967, 55; Dalby 1992, 17), a "quasiepic warrior band" (Dillery 1995, 76), like that of Odysseus and his men on their way home from Troy. What is more, because the immediate danger to the Greeks increases with the death of Cyrus, the soldiers begin—at least intermittently—to recognize a new kind of authority. In particular, Xenophon writes that Clearchus, a notoriously harsh Spartan officer, is now willingly obeyed as the supreme commander because the soldiers "saw that he alone knew what sorts of things a leader ought to do, while the rest [of the generals] were inexperienced" (2.2.6). As the sequel makes clear, however, some men must even in these perilous circumstances be compelled to obey. Clearchus knew from experience how to employ a mixture of shame and force in motivating the troops. He shamed men into working harder by jumping into the mud himself when it was time to make bridges; at the same time, he commanded with a spear in one hand and a stick in the other, dealing blows whenever he found someone shirking (2.3.11–3).

In spite of Clearchus' leadership, "normal" mercenary disunity persists in the army even after the death of Cyrus. Most important in this regard is the perceived treachery of Meno. When Cyrus is killed, Ariaius, a Persian commander who was fighting alongside the Greeks, abandons them and flees with his men. Meno later leaves the rest of the army and stays with Ariaius (2.2.1). Clearchus, who had quarreled earlier with Meno (1.5.11-7), suspects that Meno is scheming to hand the Greeks over to Tissaphernes, a deed that would not be out of character for him (2.5.27-9; cf. 2.6.21–9). This is the bait Tissaphernes uses to trap the Greek commanders: He states that, if Clearchus will come to him, he will reveal those who are attempting by slander to undermine the position of the Greeks (2.5.24-6). Meno's apparent treachery and Clearchus'

The tyrant rules persons who regard themselves as citizens entitled to a share m political power, whereas the despot rules persons "more slavish in their characters than Greeks," for which reason "they put up with a master's rule [tên despotikên archên] without any ill-will" (Aristotle, Politics 1285a20-23). Yet, Persian rule seems to be despotism only in name: Although even Cyrus is referred to as the "slave" of Artaxerxes (1.9.29, 2.5.38), he is an unwilling one.

⁹ Compare Xenophon's remark to the assembled soldiers, "You bow down to no human being as master, but rather to the gods" (3.2.13), with *Persians* 241–2: "Who is it that is shepherd and master over their army? They [the Greeks] are slaves to no man, nor are they subjects." ¹⁰ The common assumption that Xenophon idealizes Cyrus (see, e.g., Delebecque 1947, 97) is undermined by the contradiction between his apparent praise in 1.9 of Cyrus's education and character and what he has plainly indicated in his prior account of Cyrus's deeds. ¹¹ The army is composed not so much of Greeks as of Thessalians, Boeotians, Megarians, Arcadians, Achaians, Lacedaemonians, and Athenians; as such, it is a miniature image of Hellas in its rivalries and jealousies (Delebecque 1947, 47–8).

¹² Clearchus punished his men severely, in accordance with the maxim that "the soldier ought to fear his commander more than the enemy" (2.6.10). On the use of promises of wealth and power, cf. 1.3.21 and 1.4.11–3 with 1.4.13–6 and 1.7.2–9. Note that the band of thieves furnishes the model for politics according to Thrasymachus (*Republic* 343b ff.; cf. 351c).

imprudent desire for revenge thus lead almost directly to the complete destruction of the Ten Thousand.

The mercenaries' initial assumption about the profit to be gained in associating with a tyrant is refuted practically, if not theoretically—by the death of Cyrus, whose head and hand are stuck on pikes by his brother (1.10.1), and by the subsequent betrayal, torture, and beheading of the five main Greek commanders. After these murders, at the end of book 2, the title of Xenophon's book takes on a different color. The goal of the Ten Thousand is now, first and foremost, simply to survive; with respect to the well-being of their bodies and souls they have nowhere to go, so to speak, but up. It now seems that the genitive Kurou in the title Kurou Anabasis is to be read not subjectively but objectively: the story is no longer one of Cyrus's ascent but of an ascent occasioned by Cyrus and his failed quest for power. Even more inviting is the possibility that Xenophon may mean something like ascent from (i.e., above or beyond) Cyrus, an interpretation that applies well to the story of his own development as a nontyrannical ruler.13 The ascent of the community of the Ten Thousand from disintegration and death occurs under the leadership of Xenophon, who, having watched and learned from the strengths and shortcomings of Cyrus, Clearchus, Proxenus, and Meno, rises suddenly to a position of command. Xenophon's political ascent goes hand in hand with the moral and psychological renewal of the community of the Ten Thousand. The turning point or peripeteia for the Ten Thousand occurs in book 3, in the course of the first, fitful night after the murder of the Greek commanders.

Community

Before book 3, Xenophon mentions himself by name only more or less in passing (1.8.14-7, 2.4.15, 2.5.37-42). It is at the beginning of book 3 that he chooses to speak more fully about himself and the events leading up to his journey into Asia, including in particular his consultation with Socrates. The mention of Socrates prepares us to hear the peculiar resonance of his language. Xenophon begins book 3 by observing that the Greeks were "in great perplexity" (3.1.2). The word he uses is aporia, which literally describes a condition of seeing "no way out"; it is also the hallmark of a philosophical encounter with Socrates (Xenophon 1959, Memorabilia 3.10.7, 4.4.5; cf. Plato 1979-82, Theaetetus 149a). Separated from their homeland by the impassable Euphrates and Tigris rivers and by a distance of more than ten thousand stades, surrounded by enemies, and without horsemen, a market, or a guide, all of them, including Xenophon, were demoralized or "spiritless" (athumôs: 3.1.3). Few of them ate or kindled a fire that night, and many, not even coming into the camp, just lay down by themselves wherever they happened to be. In sum, the army is at this point nothing more than a disorganized mass of individually helpless atoms.

"When the time of perplexity [aporia] came," Xenophon continues, he himself was restless but did manage to catch some sleep (3.1.11). It is in fact a propitious moment, if one considers that a confrontation with death can sometimes give birth to unprecedented insights. So it is with Xenophon, who dreams that lightning from Zeus sets his father's house ablaze. To Xenophon, this emphasizes the difficulties (aporiôn: 3.1.13) that face the Greeks and spurs him to action. He awakens and rises to give three speeches. The first is addressed to the captains (lochagoi) of Proxenus and the second to all the surviving officers. In the course of the second speech, Xenophon suggests a way to encourage the soldiers: "If we can turn their minds around [trepsê(i) tas gnômas], so that they may think not only of what they are going to suffer but also of what they are going to do, they will be in much better spirits [euthumoteroi]" (3.1.41). Xenophon then is elected a general (archôn) in place of Proxenus. The last speech, which is addressed to the whole Greek army, contains a radical plan of action and organization that is ratified by a general vote, and it proves to be the salvation of the Ten Thousand. Like the three waves of book 5 of the Republic, Xenophon's three speeches bring into being a new, saving regime (cf. Republic 497a) and introduce a leader whose claim to rule is bold intelligence.

The imagery Xenophon employs in his account of this long night is both familiar and powerful. The second speech, he tells us, takes place around midnight; the third, just as day is beginning to break (3.1.33, 3.2.1). He describes a movement from dark to light, from dreaming to wakefulness, from death to renewed life, from passivity to activity, from confusion to clarity, from perplexity to understanding. He deploys terms and images that structure the action of the Republic in general and the cave image and myth of Er in particular, terms that are themselves borrowed from the poetic tradition and the religious rites of mystery initiation.¹⁴ Xenophon's double task, moreover, resembles that of Odysseus: "to win his life [psyche, literally: soul] and the return of his companions" (Odyssey 1.5), to lead the way home from deep in hostile territory by concentrating his energies in a way that also makes possible the achievement of his own identity (on the connection between these two tasks in the Odyssey, see Dimock 1974). Not surprisingly, the adventures of this warrior band are several times explicitly compared to that of Odysseus and his men. As if to make clear the dependence of homecoming upon concentrated thoughtfulness, the first reference to the Odyssey occurs during Xenophon's first speech to the whole army, when he adverts to the fate of the lotus eaters (Odyssey 9.94 ff.), who ceased to think of their homeward journey (3.2.25). The Anabasis and the Republic share the same Homeric subtext (cf. Lossau 1990).

The regime brought into being by Xenophon's three speeches nonetheless originates in such a way as to raise important questions about the nature and extent

¹³ Cf. the example thanatou lusis, "release from death," given in Smyth 1980, § 1332.

¹⁴ On the turning of the soul to which Xenophon speaks at 3.1.41, cf. Republic 518c-519b.

of justice in any possible regime. In the Republic, Socrates suggests that the just community could come into being if everyone over the age of ten left the city, so that the as yet uncorrupted youth could be educated to justice. In practice, however, forced expulsion would be necessary, so that a massive act of injustice would be required in order for the just community to come into being (Bloom 1967, 409-10). For its part, the Anabasis supports this inference about the "Machiavellian" foundations of the ostensibly just community. In the city in deed of the Anabasis as opposed to the city in speech of the Republic, accident substitutes for deliberate action in the foundation of the community. Xenophon suggests that if men are taken deep into the uncharted territory of a vicious enemy, if they face overwhelming numbers, and if by some chance their leaders are killed, then one of two things will happen: They will either strain every nerve to work together as a team, always looking out for the common good, or they will all die a miserable death. The emergence in the Anabasis of an orderly, unified, independent community, marked by high morale and a common sense of purpose, is thus made possible only by the brutal murder of the Greek commanders—an injustice, we may note, that is itself provoked by Cyrus's wrongful attempt to overthrow a legitimate ruler. Insofar as the existence of a well-ordered community (to say nothing of a genuinely just community) depends on the prior existence of injustice, however, the Anabasis teaches at a minimum that such a community cannot deliberately be brought into being without compromising its claim to justice.

There is furthermore something Machiavellian in the way in which Xenophon seizes the opportunity presented to him by fortune. He appeals to external pressure in order to accomplish reforms akin to those brought about by the use of the Noble Lie in book 3 of the *Republic*, which helps persuade the warrior class that they must not possess private dwellings or private property beyond what is strictly necessary (Republic 416d–417b). In book 3 of the *Anabasis*, Xenophon uses the threat of imminent death—not a lie, but the truth—to convince the Ten Thousand to adopt virtually identical recommendations. His main advice to the soldiers is to throw away all the private wealth they have collected by pillage and keep only the tools of war; burn their tents and wagons; help the officers administer punishment when it is merited; and march together in a hollow square (3.2.27-32, 3.2.36-7). He explains that this plan will allow the army to move more effectively, but one suspects that these measures, like their counterparts in the Republic, are designed also to help unify the army by keeping attention focused on the common tasks of returning to safety. They may assist in doing so by minimizing the temptation and the opportunity to act for private gain or to divide into factions at the expense of the whole, by ensuring that the soldiers will be always in the public eye; and, insofar as individual soldiers, as in the Kallipolis (Republic 464e-465b), will have a hand in dispensing punishment, they will allow the troops to satisfy their aggressive instincts in a way that will least threaten the interests of the whole.

Be that as it may, it is striking that Xenophon cannot prevent the soldiers from collecting animals, women, and boys along the way, to such an extent that many men are diverted from the task of fighting and the army as a whole moves too slowly (4.1.12-4, 4.3.19). The restrictions against accumulating goods that are not essential to war are soon relaxed (if not altogether abandoned), even though the danger faced by the army has not significantly diminished; thus, the army at one point seizes a load of "fine apparel and drinking cups" from the Kurds (4.3.25). As will become still more evident in the sequel, Xenophon's attempts to subordinate the private appetites of the soldiers to the achievement of public good ultimately work no better than the Noble Lie. Even in the Kallipolis, Socrates finds it necessary to win the allegiance of the best soldiers by rewarding them with frequent sex, choice cuts of meat, and distinguished honors (Republic 459d-460b, 468c-469b; Howland 1998, 645-9). In these respects, the spirited warriors of the Kallipolis—like the Ten Thousand—never quite cease to resemble the self-interested Greeks of the *Iliad*.

In accordance with Xenophon's advice at the very end of book 3, the army goes up into the mountains of Kurdistan and through Armenia, toward the source of the Tigris and the Euphrates. This geographical anabasis in book 4 coincides with another kind of ascent: the education and seasoning, through harsh experience, of the Ten Thousand. During this part of the journey, which concludes when the Greeks reach the Black Sea, the army is compelled to make its way through snowcovered mountain passes and to fight on a daily basis against valiant foes, including Kurds, Chaldaeans, Taochians, Chalybeans, Phasians, Macronians, and Colchians. In the end, no more than two-thirds of the Greeks who began the expedition with Cyrus could endure the extreme hardships of battle, frostbite, snowblindness, disease, and starvation so as to make it to the sea.¹⁵ This extraordinarily tough regimen perhaps serves to purge the weak and disorderly from the army. At all events, it calls to mind the difficult education of the souls and bodies of the Auxiliaries in the Republic, who are compelled to confront many "labors, pains, and contests" (413d4), insofar as it seems in Xenophon's initial estimation to provide an adequate training for citizenship. It is with the surviving soldiers, all "very fit [hikanous] through long practice," that he dreams of founding a city (5.6.15-6).

Disintegration

Book 4 is the central book of the *Anabasis*, and it describes the period in the career of the Ten Thousand in which the community achieves maximum order and harmony. The unity in book 4 is sufficient to overcome, at least temporarily, the extreme suspicion and hostility between Athenians and Spartans that obtain after the

¹⁵ At 1.2.9, we are told that Cyrus's Greeks number approximately 13,000. At 5.3.3, a review at arms yields a count of 8,600.

end of the Peloponnesian War and that erupt in the subsequent books. The playful banter between Xenophon and the Lacedaemonian Cheirisophus, for example (4.6.14-7), suggests remarkable confidence and energy, a point underscored by the friendly rivalry in virtue described at 4.7.8-12 and especially by the athletic games the Greeks hold to celebrate arrival at the Black Sea (4.8.25-7). These exuberant contests put one in mind of the games in which Odysseus participates when visiting the Phaeacians (Odyssey 8.100 ff.). This parallel is confirmed by the remark of Leon the Thurian at the very beginning of book 5, who now proposes, since the Greeks have finally reached the sea at the Greek city of Trapezus, "to cease from toil...and to arrive in Hellas stretched out, like Odysseus" (5.1.2). The allusion is to the journey from the island of the Phaeacians to Ithaca, which is accomplished while Odysseus sleeps in the boat (Odyssey 13.75–124).16

In alluding to the beautiful city of the Phaeacians, Xenophon also implicitly invites us to recall the noble and beautiful city of the Republic (Howland 1993, 52-3). But these allusions ultimately underscore the evanescence of the dream of the ideal polis. First, the island of the Phaeacians is not Odysseus' final destination; like the Kallipolis, it is an unplanned detour from the main path. No less important, the athletic contests of spirited warriors in book 4 of the Anabasis bear at least as much resemblance to the games in *Iliad* 23 as to those in *Odyssey* 8. The former games provide only a brief moment of relatively peaceful and well-ordered competition in a world of chaos. In repeatedly comparing the Ten Thousand to the quarrelsome warriors of the *Iliad*, Xenophon never quite lets his readers forget what he himself seems to have forgotten for a time.

Once at the Black Sea, the Greeks no longer have a sense of immediate external threat. The beginning of book 5 marks the start of a parabasis, a "going along" the coast toward the Hellespont, which extends through book 6. This geographical parabasis, however, is concurrent with a moral and political katabasis. Leon the Thurian's remark is a sign that a decisive transition has occurred, namely, the beginning of a return to ordinary political reality from a brief period of extraordinary order and unity. The remark is itself a virtual act of rebellion: Leon announces publicly that he is tired of discharging the duties of a soldier (Delebecque 1947, 56). Additional signs of disintegration appear almost immediately. Liberated by the apparent lessening of danger, the troops feel free to shout down Xenophon's suggestion that they make contingency plans to go by road (5.1.13-4). Xenophon finds it necessary to warn them about keeping good discipline, and he repeats this warning after some soldiers are killed while pillaging (5.1.8-9, 5.4.20). He nonetheless begins to dream of founding a "great" city (5.6.15-6; cf. 6.4.1-6). Because this dream contrasts starkly with the emerging political situation, it further emphasizes for the reader

the incomplete, fragile, and ephemeral nature of the order and unity achieved in book 4.

It is in fact Xenophon's Platonic ambition to craft a city from an army that brings him afoul of the soldiers: in confiding his dream, he falls victim to the greed of a seer, Silanus, and of two rival officers, Timasion and Thorax (5.6.17–26). For the first time, Xenophon is obliged to defend himself against accusations before the assembled troops (5.6.27), and he must do so again when the soldiers, reacting to slander against him spread by another officer, threaten to stone their commanders (5.7.1-33). Book 5 concludes with a public scrutiny of the behavior of the generals, equivalent to the Athenian practice of *euthuna*, or public accounting after a term in office. For the third time, Xenophon must undertake an apologia in the face of public accusations of injustice (5.8.1-26). The three defensive speeches in book 5 seem to present a reverse image of the three speeches by which Xenophon unites and energizes the Ten Thousand in book 3.

The situation parallels Socrates' account of the inevitable decline of the Kallipolis in book 8 of the Republic, which begins, perhaps not coincidentally, with a reference to the burning of the Achaean ships by the Trojans in the Iliad (Republic 545d-e; cf. Iliad 16.112 with Bloom 1968, 467 n. 4). Socrates explains the emergence of timocracy as the outcome of a quarrel between aristocrats and oligarchs, or lovers of virtue and lovers of money; these are precisely the terms in which Xenophon presents his conflict with Silanus, Timasion, and Thorax (cf. his references at 5.6.21 to what is "noblest" [kallista] and "best" [arista], together with 5.6.18, 5.6.21, and 5.6.25-26).¹⁷ The compromise that results from this quarrel is a regime ruled by war-lovers who secretly covet gold and silver (Republic 547c-548b). This is a fairly good description of the orientation of the Ten Thousand after they have been liberated from the fear of imminent death.

The parabasis along the Black Sea continues in book 6, toward the end of which the Spartans take control of the army (6.6.5). In book 7, the story returns in more than one sense to the place from which it began. As noted above, the conclusion of the Anabasis finds Xenophon in Pergamus, near Sardis, the city where Cyrus collected his troops and from which the march up country began (7.8.8; 1.2.5). More important, a new Cyrus comes into the picture in book 7. The remaining Greek force, now numbering 6,000 (7.7.23), is for the second time employed by a barbarian prince, Seuthes the Thracian. He proposes to use Greek mercenaries for the same purpose that Cyrus had in mind, namely, to conquer a kingdom that he regards as rightfully his (7.2.31–4). Like Cyrus, Seuthes lives by plundering his own lands (7.2.34). Like Cyrus, he wins the allegiance of the Greek troops by making promises of pay and territory that he ultimately cannot (or will not) fulfill (cf. 7.2.36–8 with 7.5.4–5 and 7.7.48–57; 1.2.11, 1.3.21, 1.4.13, 1.7.5-8). Most important, he is, like Cyrus, a tyrant. Under his rule, the lot of the Thracians is

¹⁶ Lossau also identifies Trapezus with Scheria, the island of the Phaeaccians, and notes the parallel between the games in both texts (Lossau 1990, 47).

¹⁷ Xenophon is nonetheless not insensitive to the attractions of money, as is clear from his robbery of the Persian Asidates (7.8 22–3).

slavery (douleia); they are "subjects" (hupêkooi) who obey him only out of necessity and who would attempt once again to become free were it not for their fear of him (7.7.29, 7.7.32). Cyrus punishes "most mercilessly" (apheidestata: 1.9.13), and Seuthes kills "without mercy" (apheidôs: 7.4.6); both men inspire fear in those they wish to rule by burning the land (1.4.10; 7.4.1, 7.4.5).

Xenophon's narrative comes full circle: It returns in the last book of the Anabasis to a world governed by a tyrant and guided by the assumption that such a man must be the happiest of human beings. This circularity emphasizes the intransigence of political reality and places in the broadest perspective the political significance of the adventures of the Ten Thousand. Xenophon makes it clear that what came into being all too briefly in the Anabasis was, after all, neither a fullfledged city nor a truly just and well-ordered community, although it was as well ordered, and reflected as much devotion to the common good, as any political community we are likely to encounter in the annals of history. As in the Republic, the ideal city—a city in which human beings are devoted to the common good at all times, not just when exigency compels such devotion, and in which the common good transcends self-preservation—must ultimately merely the wish of good men (cf. Republic 592a-b). The Anabasis, like the Republic, lets us see the limits of politics.

XENOPHON'S PHILOSOPHICAL COURAGE

The Anabasis shows that the well-ordered community of the Ten Thousand comes into being only through Xenophon's own activity as a political founder and ruler. In the Republic, Plato makes it clear that the paradoxical figure of the philosophical ruler must be understood in terms of the relationship between thumos and erôs. It is this seemingly vexed relationship that stands at the center of the Republic and, I submit, of the Anabasis as well.

Xenophon begins to speak about himself in the first portion of book 3, immediately after describing, at the very end of book 2, three of the Greek leaders murdered by the Persians. This is a clear invitation to the reader to compare his nature with the very different natures of Clearchus, Proxenus, and Meno. In what follows, I propose to show that the contrast between Xenophon and these three companions may best be understood in terms of Socrates' characterization of philosophical and nonphilosophical souls in the Republic. Although Xenophon provides no explicit discussion in the Anabasis of the nature of the soul in itself, his description of his three companions answers to the account of the tripartite soul Socrates sets forth in book 4 of the Republic, and his actions in book 3 of the Anabasis seem to amplify and develop an important Socratic hint about the difference between political and philosophical courage (Republic 430c).

The Anabasis tells the story of the emergence of a philosophical ruler. Xenophon's leadership in the army is philosophical because it is informed by the knowl-

edge of that which lies beyond the horizons of nomos (custom or convention) and because it is oriented by a good that is transpolitical. Xenophon's saving intelligence is first and foremost expressed in the speeches of book 3, speeches that give heart to the soldiers, establish good order in the ranks, and focus the energies of the army on a well-defined goal and plan of action. Yet, it is something more than intelligence that allows Xenophon to find his voice in the first place. As he makes clear in the story of his dream "from Zeus," he is sustained in the moment of crisis by great courage. It is his courage in the face of terrifying obstacles that opens up a space within which calm and collected reflection may occur. Courage is thus the indispensable precondition for Xenophon's philosophical rule. But what is the nature of this courage?

In book 4 of the Republic, courage is "officially" presented as the virtue of thumos, which stands in between the appetitive (epithumêtikon) and calculative (logistikon) parts of the soul (442b-c). Yet, this account of the soul is deficient to the extent that it abstracts from the love of wisdom, which enters fully into consideration only with the introduction of philosophical eros in book 5. Socrates indicates there is another kind of courage that transcends the "political" courage described in book 4, and I believe Xenophon manifests precisely this higher, philosophical courage. Political courage consists in clinging fast to orthodox opinion under adverse conditions and so exists only within the horizons of nomos, whereas Xenophon's courage comes into play in response to the destruction of these very horizons. Also, Xenophon's deeds in the moment of crisis are not motivated essentially by the thumotic longing for victory or honor or by indignation against the Persians. Rather, the interior energy upon which he draws is essentially erotic; one could just as well say—following his suggestion that he is spurred to action by a light from Zeus (3.1.12)—that he is drawn by it. Furthermore, Xenophon's philosophical erôs orders and guides his soul as a whole; hence his response to the dream is simultaneously spirited and intelligent, passionate and reflective. This complexity reflects the saving integrity of his psyche, which he pointedly displays in book 3 against the backdrop of the three partial or fragmented characters he describes at the very end of book 2. Finally, Xenophon's introduction of Socrates at the beginning of book 3 is meant to clarify the philosophical origins of his exemplary wholeness. In courageously saving himself and his companions, Xenophon displays in deed the Socratic wisdom he first acquired through speech.

Xenophon could not have predicted that his journey away from home and hearth would bring him back to his intellectual father. The circularity of the *Anabasis* as a voyage of self-discovery is described in a penetrating epigram composed by Diogenes Laertius (1991) and set forth in his *Lives of Eminent Philosophers* (2.58):

Not only on account of Cyrus did Xenophon go up [anebên] into Persia,

But rather because he sought whatever path might lead up [anodon] into the region of Zeus.

For, having shown that Hellenic deeds [Hellenika pragmata]

were the outcome of his education [paideia], He recollected how noble and beautiful [kalon] was the wisdom of Socrates.

Diogenes situates Xenophon's adventures in the Anabasis in the context of a journey of the soul, and he offers a matrix of pregnant oppositions within which to consider the significance of this journey. Xenophon seeks the way to "Zeus," or to that which is highest and best. He sets out for Asia thinking that Cyrus, the political figure par excellence, may be the path to this Zeus. His experiences, however, confirm the supreme merit of the philosophical path of Socrates, a point underscored by Diogenes' rhetorical juxtaposition of the phrases "region of Zeus" and "wisdom of Socrates." At the end of his journey, Xenophon is able to see in the clear light of hindsight what was already there at the beginning: His practical experience, including moments of failure as well as success, allows him fully to appreciate the excellence of his Socratic education (Bruell 1987, 111-4; Higgins 1977, 91-2). Indeed, in looking back Xenophon sees, not Socrates' philosophia (love of wisdom), but his noble and beautiful sophia (wisdom). Paradoxically, he recognizes that his quintessentially Hellenic political deeds are the outcome of Socratic, philosophical speeches. Finally, Diogenes leaves it open whether Xenophon reaches the goal of his journey in doing great deeds or in achieving the wisdom that comes to him through reflecting on the significance of his actions. The same ambiguity is present in the image of Xenophon as a sitting eagle that comes to him as an omen from Zeus at the outset of his voyage (6.1.23). The eagle is the king of birds and the sign of Zeus, but sitting or standing still is the posture of philosophical meditation (cf. Plato, Symposium 174d–175b, 220c–d).

Diogenes' insights into Xenophon are borne out by the text of the Anabasis. Let us first consider the inception of Xenophon's odyssey as related at the start of book 3. After an introduction that is both classical and biblical in wording ("There was in the army a man named Xenophon, an Athenian"), Xenophon tells us that he received a letter from his friend Proxenus, inviting him to accompany the Greek mercenaries and offering to introduce him to Cyrus, "whom he Proxenus] himself, he said, believed to be better [kreittô, literally: stronger] than his own fatherland [tes patridos]" (3.1.4). A few pages earlier, Xenophon offers a eulogy of Proxenus that begins by stating he was someone who, "ever since his youth, longed to become a man capable of doing great deeds" (2.6.16). To this end, he studied with the sophist Gorgias, after which, "thinking that he was capable of ruling," he went to Cyrus, with whom "he believed he would acquire a great name, and great power, and many possessions" (2.6.17). Xenophon does not tell us what his own motives were in wishing to join Proxenus, but it is evident that he, too, sees in connection with Cyrus something that seems to promise more than both Athens and Socrates can offer him. He chooses to go with Cyrus despite Socrates' warning that doing so will anger the Athenians, inasmuch as Cyrus had "eagerly

joined with the Lacedaemonians in making war against Athens" (3.1.5).

It has been argued that Xenophon, unlike Proxenus, was "not interested in ruling" and joined Cyrus not out of "any love of the political life" but for "frankly utilitarian considerations," namely, "as a means of gaining wealth and, perhaps, a safe haven in a world of a considerable amount of turmoil." From this point of view, Xenophon was "more or less compelled to take an interest in political rule [after the death of Cyrus], if only to save himself along with his fellow Greeks" (Ruderman 1992, 129–30). Xenophon's motivation in joining Cyrus was not that of Proxenus, but the latter interpretation does not square completely with what is revealed in the Anabasis. Xenophon consistently manifests an interest in power that seems to be at least partly philosophical, as well as a desire to become involved in important decisions.

Just before the battle of Cunaxa, Cyrus goes out in front of his army to survey the situation, and Xenophon rides out to ask whether he has any orders to convey (1.8.14–7). Strictly speaking, this is unnecessary, since Cyrus is surely capable of giving orders on his own or of making it known that he desires to do so. What is more, Xenophon arguably oversteps his bounds: It would be appropriate for Cyrus to convey any orders he might have through an officer, whereas Xenophon is, as he tells us later, "neither a general, nor a captain, nor a soldier" (3.1.4). His gesture may indicate a desire to serve the prince after the fashion of a lieutenant, or perhaps he wishes simply to observe Cyrus more closely so as better to understand him.

Subsequent passages confirm Xenophon's interest in participating in military and political decisions (2.4.15-8, 2.5.37-42). His thinking when he is offered sole command of the army in book 6 reveals an attraction to honor as well: "Xenophon in one way desired these things, believing both that greater honor would come to be his in the eyes of his friends, and that his name would be greater when it should reach his city, and also that he might chance to be the cause of some good for the army" (6.1.20). Xenophon is tempted above all by the reputation associated with the position of plenipotentiary commander, although his special concern with how he is seen by his friends indicates a more philosophical attitude toward honor than that of the most ambitious political men (cf. the discussion in Strauss 1991, 88, of the contrast in Xenophon's Hiero [1956] between Hiero's desire to be universally loved and Simonides' desire to be admired by "the competent minority"). The "chance" that Xenophon could benefit the army occurs to him almost as an afterthought. On the negative side of the ledger, moreover, Xenophon mentions only the possibility that he might lose the reputation he has already acquired (6.1.21).

In sum, Xenophon suggests that he goes with Cyrus because he is drawn to the splendor and honor of the political life (cf. Bruell 1987, 111; Higgins 1977, 91). Following Diogenes, however, we may suppose that his attraction to politics is more open-ended or experimental than that of Proxenus, and he is motivated essential.

tially by the possibility that along this path he may discover that which is highest and best. This understanding of Xenophon's initial motivation helps make sense of his behavior with respect to Socrates. Xenophon responds to Proxenus' invitation the way any ambitious young man would: He ignores the sober advice of his "father" concerning perhaps the most important decision he will ever make. Socrates tells him to consult with the Delphic oracle, but Xenophon, having already decided to go, asks only about the god to whom he should sacrifice in order that his journey might be a success; the answer is Zeus (3.1.5, 6.1.22). As is appropriate in a story about crossing the threshold of maturity and independence, Xenophon's headstrong decision coincides with the loss, to him, of his intellectual father: Socrates is executed while he is away.18

With respect to the difference between Socrates and Xenophon, Strauss (1975, 124) observes that "Xenophon was a man of action: he did the political things in the common sense of the term, whereas Socrates did not, but Socrates taught his companions the political things with the emphasis on strategy and tactics." Strauss (p. 139) asks: "Does not knowledge of rule need some iron alloy, some crude and rough admixture in order to become legitimate, i.e., politically viable?" Xenophon's departure from Athens stems from his longing for important action, and it is the spiritedness intrinsic to this longing that adds iron to his Socratic awareness.19 Yet, Xenophon's journey follows a pattern already established by Socrates. It is no accident that his odyssey begins from Delphi-and, in a deeper sense, from the repetition (through the dream sent by Zeus) of the opportunity to encounter the sacred that he effectively avoids at Delphi—for Delphi is the origin of Socrates' own Heraclean philosophical labors or wanderings (cf. 6.2.2 and 6.2.15 with Plato, Apology 22a).

One thing Xenophon brings with him to Asia is the Socratic openness that makes genuine learning possible. He accordingly writes the *Anabasis* as if it were a record not only of events but also of his realization of the significance of these events. This is especially apparent in his description of Clearchus, Proxenus, and Meno, which is offered immediately before he goes on to speak at length about himself (2.5.1–29). These men are all warriors by nature, which is to say that they all exemplify thumos, the goals of which are identified by Socrates as "the satisfaction of honor, victory, and

anger" (Republic 586d1). Yet, each represents a distinct inflection of thumotic ambition, answering to the three parts of the soul and city distinguished in book 4 of the Republic (440e-441a). Meno's thumos is associated with *epithumia* or appetite, the lowest level of the soul, and is directed at material gain, the object of the lowest part of the city: "It was clear that he strongly desired [epithumôn] to be rich, that he desired [epithumon to rule so that he might get more, and desired [epithumôn] to be honored in order that he might gain more" (2.6.21; cf. Aristotle 1979, Nicomachean Ethics 1159a17-21). Clearchus stands at the second level of the soul and city. He was, as it were, pure thumos: A harsh and vengeful man, he was "warlike and a lover of war to the ultimate degree" (2.6.1), and his aim was victory for its own sake. Proxenus embodies the highest part of the soul as it is understood in book 4 of the Republic, or before the introduction of philosophical intelligence in the third wave of book 5; at this stage of the dialogue, the ruling part is identified simply as logismos, or "calculation" (439d). Proxenus effectively put his trust in logos, insofar as his primary preparation for rule consisted in studying with the rhetorician Gorgias (2.6.16-7). He was a gentleman who desired above all the splendor of virtuous accomplishment: He sought great honor, power, and wealth, but "he thought that it was necessary to obtain these things with justice and nobility, but without them, not [to obtain them] at all" (2.6.18; cf. Republic 443e).

It is important to reiterate that Meno, Clearchus, and Proxenus exemplify the parts of the soul or city only as these are understood before the introduction of philosophy as a ruling principle in book 5 of the Republic. Each man is therefore in his own way deficient, both with regard to the order and integrity of his soul and with regard to the insight necessary for leadership at the highest level. It is philosophical erôs that binds the parts of the soul together into a well-ordered whole (cf. Republic 485a-487a), and it is philosophical insight that alone makes possible independent and authoritative judgment in situations of the most extreme exigency.

Let us again consider each of the three deceased commanders. Meno was ruled by an appetite for wealth unconstrained by justice or piety (2.6.21, 26). He prided himself on taking advantage of those who considered him a friend, and he sought to win the allegiance of his soldiers by participating in their wrongdoing (2.6.23–7). As already noted, Meno's divisive behavior had made Clearchus suspicious and so helped Tissaphernes lay a trap for the Greek commanders. Whereas the vicious Meno was ineffective at winning the trust of decent men, the virtuous Proxenus had the opposite problem: "He was able to rule gentlemen [kalôn men kai agathôn], but was not capable of putting respect or fear of himself into the soldiers" (2.6.19).20 Proxenus relied too much on the power of speech to guide men; by the same token, he

¹⁸ His decision may also have resulted in the loss of his fatherland, as Socrates seems to have warned (3.1.5); he is ultimately exiled from Athens (5.3.7), although scholars disagree as to whether the reason was his service to Cyrus or to the Spartan king Agestlaus (Anderson 1974, 147-9; Higgms 1977, 22-4).

¹⁹ The line between eros and thumos becomes blurred insofar as spiritedness is intrinsic to strong erotic attraction. Consider the story of Episthenes, a lover of boys, who appears before Seuthes in an attempt to spare the life of a young prisoner of war. Xenophon intercedes, citing Episthenes' past bravery in the company of handsome young men; Episthenes then offers his own life in exchange for that of the prisoner (7.4.7–11). He exemplifies on the level of ordinary experience the spiritedness intrinsic to Xenophon's extraordinary, philosophical eros.

²⁰ Meno, too, had been a student of Gorgias (Plato, *Meno* 71c-d), a fact that speaks to the moral indeterminacy and incompleteness of sophistry in comparison with Xenophon's Socratic education.

cared too much what others said and thought about him. On the one hand, he believed that the obedience of the men he commanded could be won by praise and blame alone; on the other, he feared incurring the hatred of his soldiers (2.6.19–20). With regard to Clearchus, Xenophon notes laconically that "it was said that he did not very much like to be ruled by others" (2.6.15). Thumos, however, is properly ruled by philosophical intelligence, and it is the lack of such ruling intelligence in Clearchus that leads directly to the murder of the Greek generals. Like the Guardians whom Socrates distinguishes from the Auxiliaries at the end of book 3 of the Republic, Clearchus was both older than the other generals (he was "about fifty years old" when he died, 2.6.15) and was characterized by great courage (cf. Republic 412c-e). Civic or political courage is the power to hold fast to governing orthodoxy, much as well-dyed wool keeps its color even under the most adverse conditions (Republic 429d-430c). Clearchus exemplified this kind of courage both in exhibiting bravery in the face of danger and in clinging to the ways and customs of his homeland. In particular, he was very pious; he even left an important meeting with the ambassadors of Artaxerxes in order to attend to the sacrifices (2.1.9). It was precisely this piety, however, coupled with his thumotic desire for revenge against Meno, that blinded him to the trap set by Tissaphernes. It did not occur to him that Tissaphernes swore a false oath of friendship, or that he was lying when he denounced those who are willing to perjure themselves before god (2.5.3, 2.5.21).

Whereas the ill-fated generals embody the three parts of the soul in abstraction from philosophical eros, Xenophon exemplifies the power of erôs to unify and guide the psyche. He underscores the essential difference between himself and the three generals in subtle ways. At 2.3.16, in the context of a discussion of edible plants that cause headaches (kephalalges), he observes that the whole palm tree withers when its pith—the part of the tree that is "in its head" (ho engkephalos)—is removed. This observation anticipates the Persian strategy of removing the heads or leaders of the army so as to destroy the whole (3.2.29). But this remark also appears to be a pun on the name of the *Republic*'s Cephalus, the head of a family and father of Polemarchus and Lysias: The pious Clearchus, we are meant to see, is the Cephalus of the *Anabasis*. In the Republic, Socrates moves into the center of the discussion when Cephalus goes off to sacrifice (331d). A similar substitution occurs in the Anabasis when Xenophon, who ultimately becomes a "father" in the eyes of his soldiers (7.6.38), takes over the role played previously by Clearchus and the other generals. Xenophon alone is able to transcend the horizons of custom or convention (nomos) that limit the vision not only of Clearchus but also of Meno and Proxenus. Meno is utterly conventional in his worship of wealth, and Proxenus pursues the more respectable but equally conventional goal of a good name. Having spent time with Gorgias, Proxenus "straightaway believed [nomisas hêdê that he was capable of ruling" (2.6.17). The verb nomizein properly signifies belief in accordance with nomos. Proxenus accordingly puts his trust in the good opinion of other men, and he regards the study of logos not as a route to philosophic wisdom but as a mere instrument for the acquisition of reputation and power.

Xenophon stands apart from the three deceased generals in that he is able to see beyond the horizons of custom and convention and into that which is by nature. His leadership reflects a knowledge of both the nature of the human soul and the nature of political community. His political intelligence furthermore reflects an integration of the three parts of the soul that were separated in the personalities of his colleagues. He combines the nobility of Proxenus with the toughness of Clearchus, without forgetting the necessary appetites that are so forcefully represented by Meno. Xenophon's rhetorical strategy is not to dwell simply upon what is needed for survival; rather, he emphasizes the nobility of the great deeds that the Greeks are now called upon to perform (Ruderman 1992, 132). He nonetheless leads with both eyes open, so to speak, always keeping one eye on the noble and the other on the necessary.

Two examples of Xenophon's open-eyed toughness stand out. The first is his forceful suppression of Apollonides, the man who objects to the plan of action Xenophon proposes during his first speech to the captains of Proxenus. Apollonides points out the overwhelming advantage enjoyed by the Persians and recites the numerous difficulties (aponai) that confront the Greeks (3.1.26). Xenophon quickly cuts him off, implies that he is both stupid and cowardly, declares that he shames all of Hellas, and proceeds to suggest that he be demoted and made to serve as a slave. The result is that Apollonides is directly expelled from the group (3.1.27–32). In this instance, Xenophon appeals to the noble (the self-respect of his fellow Greeks) so as to accomplish the necessary (the complete silencing of negative voices), and he does it all with Clearchean ruthlessness. The political understanding displayed here is profound: The freedom of speech that characterizes the community of soldiers after Xenophon's ascent (see esp. 4.3.10) is made possible only by the prudent use of force to suppress dangerous speech at the moment of founding.²¹ The second example of Xenophon's open-eyed toughness is his comment on a guide who ran away after being beaten. Xenophon points out that Cheirisophus struck the man but did not tie him up afterward, and he quarreled with Cheirisophus about "the ill-treatment of the guide and the carelessness" (4.6.3). We may infer from this that Xenophon would not have beaten the man in the first place, but had he done so, he would have made sure to tie him up.

Xenophon's philosophical transcendence of nomos

²¹ Xenophon's harsh treatment of Apollonides and its unifying consequences are reminiscent of Odysseus' violent response to criticisms of Agamemnon by Thersites during an early assembly of the troops (*Iluad* 2.244–77, cf. Daiby 1992, 21). Compare the joke by Polemarchus about the use of force at the beginning of the *Republic* (327c) (Polemarchus jokes that if Socrates is not willing to join their party, he and his companions will use force to compel him to do so).

is also, and most important, the central theme of the dream that comes to him at the time of greatest perplexity. The dream seems to him a sign from Zeus, as if in answer to his experience of aporia (3.1.2, 11). In his own mind, the dream offers a second chance to learn from an encounter with the sacred, which Xenophon was not ready to do when he went to Delphi but for which he has perhaps been prepared by subsequent dangers and hardships. The connection between the dream from Zeus and the oracle at Delphi is strengthened by the dream's ambiguous character: Like an oracle, it responds to an (unvoiced) question ("Seeing no way out, what am I to do?"), which it "answers" indirectly and only according to the manner in which it is interpreted.²²

The dream is simply this: "There was thunder, and lightning fell on his father's house, and as a result everything was set ablaze" (3.1.11). The image conveys Xenophon's complete abandonment: He can expect help from no city, no general, no teacher, and henceforth he must rely only on himself (3.1.14). On a deeper level, the image reflects the collapse of the Greek horizons in a strange and profoundly hostile world. The very gods seem to have abandoned the Ten Thousand, as the Persians have broken their oaths with apparent impunity. Under such circumstances, the ways of one's father—the "house" destroyed in the dream—can no longer offer shelter and protection. The only hope lies in building a new political dwelling from the ground up. This task, which involves fashioning new nomoi, calls for a genuinely original or foundational intelligence. By the same token, it also calls for a kind of courage that is not defined by steadfast adherence to nomos.

Xenophon responds to the crisis in a way that leaves no doubt about his foundational intelligence. He succeeds in introducing a new goal for the community (i.e., returning to Hellas, 3.2.26), passing new decrees (including burning the wagons, tents, and superfluous baggage, 3.2.27–8), establishing a new marching order (3.2.36), and awakening a new ethos of responsibility (3.2.31). These saving deeds, however, are made possible by his extraordinary courage, the nature of which comes into view in his immediate response to the dream. One is especially struck by the optimism of Xenophon's first thought upon waking: "He judged the dream in one way good, because in the midst of labors and dangers he seemed to see a great light from Zeus" (3.1.12). But because "the fire seemed to blaze all about," he was also "afraid . . . lest he might not be able to escape from the King's country" (3.1.12). Although the dream portends death, Xenophon seizes the inherent promise of the moment. Lesser men might have been blinded and paralyzed by the dream holocaust, but this frightening vision affects him in exactly the opposite way. In his remarkable interpretation, the terrible fire becomes a meaningful sign from the highest divinity. Xenophon feels fear and is well aware of the dangers at hand; yet, his response to the dream is not courageous in any ordinary sense, because all that sustains him is the "light" coincident with the destruction of the very horizons that inform political courage. Zeus's light, furthermore, signifies nothing more than the promise of intelligibility; it is at best an invitation to reflection, not an answer in itself. On the basis of this promise alone, Xenophon regards the dream as a good omen. His courage thus seems to be a function not of thumos (as is political courage) but of his philosophical erôs: His interpretation of the dream manifests the confidence he feels in his power to find a way out of even the most challenging aporia.

As the promise of intelligibility, the light from Zeus ambiguously expresses both the power of Xenophon's intelligence and the intrinsic visibility of the solution to the problem he confronts. Understood thus, Xenophon begins to see the light from Zeus at the moment he identifies divine illumination as the central feature of the dream. It is in this light of intelligibility that he also proceeds to interrogate himself. Xenophon's intellectual training comes to the fore when he responds to his perplexity by initiating a process of Socratic questioning:

Why am I lying here?... If we fall into the king's hands, what prevents our seeing all the most cruel sights, and experiencing the most terrible sufferings, and being put to death violently? No one is making preparations or taking care as to how we will defend ourselves... What about me? What general, from what city, do I expect to do these things? What age am I waiting to attain for myself? For I will never be any older, if I give myself up this day to our enemies (3.1.13-4).

As this passage makes clear, it is through internal dialogue that Xenophon is able to arrive at an understanding of what must be done. To see in the light from Zeus is thus to reflect upon perplexity after the fashion of Socrates, calmly and courageously pushing a line of inquiry to its ultimate conclusions. This relentless dialogical process burns away all that is inessential and irrelevant so that the very heart of things is finally exposed to view. It is this clear vision of the hard truth that saves Xenophon and the Greeks.²³

In the last analysis, the light from Zeus in which Xenophon thinks his way out of aporia in the moment of crisis bears a strong resemblance to the light of what Socrates, in book 6 of the *Republic*, calls the Good. The sunlike Good illuminates the path of philosophical reflection, and it is the Good toward which the philosopher is drawn by his erôs. Xenophon's erôs for what is highest and best makes him receptive, in the dream sequence, to an inner, guiding vision, much as Socrates was guided by his daimonic sign (Xenophon, *Memorabilia* 1.1.2; Plato, *Apology* 31d, 40a). And it is Xenophon's philosophical divination of that which Socrates calls the Good—"that which every soul pursues, and for the sake of which it does everything" (*Republic*

²² The appearance of the character named "Apollonides" mmediately after the dream (3.1.26) reminds us of the god at Delphi and may further suggest that the dream is, so to speak, the mask of Apollo.

²³ If Xenophon is the "young man" of 2.4.19 (as the context may suggest: cf. 2.4.15–8), he has already manifested the ability to fight fear with logic Compare Socrates' reasoning about death in Plato, *Apology* 40c–1c.

505d11-e1)—that directs him, in the end, to ascend beyond politics by recollecting the noble and beautiful wisdom of Socrates.

CONCLUSION: XENOPHON AND SOCRATES

I have attempted to show that Xenophon's Anabasis can most fruitfully be read as a companion piece to Plato's *Republic*, and I have suggested that Xenophon's reason for writing in this manner was to engage Plato in a dialogue about the nature of Socratic philosophizing. Plato's Republic presents a paradox. It centers upon the opposition between the thumos of the political man and the eros of the philosopher, but the philosopherking of the Kallipolis is nevertheless supposed to overcome this opposition. The *Anabasis* speaks to this paradox by displaying the roots of Xenophon's saving political leadership. Xenophon showed both spiritedness and courage, qualities that are ordinarily assigned to thumos. My examination of the Anabasis suggests, however, that Xenophon's spiritedness is indistinguishable from his philosophical desire, and his courage is, by the same token, a function of his philosophical eros. The highest human souls, Xenophon suggests, are the strongest and most resourceful ones, precisely because they are most ardent in the pursuit of wisdom. In them, eros binds together the parts of the soul and guides the whole soul in such a way that the parts are transformed. The vocabulary appropriate to speech about nonphilosophical souls is no longer appropriate in the case of someone like Xenophon. Socrates' characterization in the Republic of the role of thumos within the soul does not apply to philosophical natures, in whom courage is an expression of passionate intelligence or of the energy with which the whole soul is drawn toward wisdom.

Seen in the light of the Anabasis, the conflict between erôs and thumos is not intrinsic to the Socratic philosopher; it is rather a consequence of the fragmentation of lesser psyches. This insight makes it possible to understand the relationship between Xenophon's philosophical nature and his political activity. Although his decision to go to Asia is on the surface a rejection of Socrates' abstention from what Strauss calls "the political things in the common sense of the term," Xenophon does not, as Diogenes realized, go beyond Socrates in the most fundamental sense. To "go beyond" Socrates in such a way as to become oneself is in any case, as Kierkegaard (1985, 111) has suggested, the quintessentially Socratic deed.

Disaggregating and Explaining Corporate Political Activity: Domestic and Foreign Corporations in National Politics

WENDY L. HANSEN and NEIL J. MITCHELL University of New Mexico

orporate political activity is usually operationalized and analyzed as financial contributions to candidates or political parties through political action committees (PACs). Very little attention has been paid to other dimensions, such as lobbying, in a systematic way. On a theoretical level we address the issue of how to conceive of PAC contributions, lobbying, and other corporate activities, such as charitable giving, in terms of the strategic behavior of corporations and the implications of "foreignness" for the different types of corporate political activity. On an empirical level we examine the political activities of Fortune 500 firms, along with an oversampling of U.S. affiliates of large foreign investors for the 1987–88 election cycle.

¬he business community, which extends beyond national boundaries, is one of the most important sources of interest group activity. Domestic and foreign corporations as well as trade associations account for the preponderance of politically active groups in the United States. There are various dimensions to corporate political activity, but scholarly research has focused almost entirely on financial contributions to candidates through corporate political action committees (PACs). Although it is acknowledged that other dimensions merit analysis, it is argued that "corporate PAC donations are important in themselves, but they also should be understood as one quantitative indicator of a range of other corporate political activity" (Su, Neustadl, and Clawson 1995, 23). Scholars of citizen participation once adopted a similar position: "Almost all measures of political involvement and participation are highly correlated with one another and for analytical purposes, interchangeable" (Berelson, Lazersfeld, and McPhee, quoted in Verba and Nie 1972, 44). But Verba and Nie (p. 45) disagree: "Our view differs. . . . There are many types of activists engaging in different acts, with different motives, and different consequences." Because PAC contributions are a convenient measure of activity and because scholars have used contributions as a general indicator, there has been very little systematic analysis of other dimensions of corporate political activity. We directly address this deficit and examine the determinants of a collection of activities that constitute business political participation.

We examine political activity directed at public preferences through sponsorship of the arts and charitable donations, at candidates in election campaigns through financial contributions made by PACs, and at policymakers through lobbying, and we explore what accounts for interfirm variation in activity. At a minimum, it is necessary for political scientists to include

Wendy L. Hansen (wlhansen@unm.edu) is Associate Professor of Political Science and Neil J. Mitchell (nmitchel@unm edu) is Professor of Political Science, University of New Mexico, Albuquerque, NM 87131.

The authors thank Robert Biersack, Kishore Gawande, Nolan McCarty, Michael Munger, participants of Harvard University's Workshop in Political Economy, and the anonymous reviewers for their helpful comments on earlier drafts of this paper.

these other dimensions if they want to move toward a more complete picture of the political activity originating from corporations. Furthermore, analysis of activity at the local and international as well as national level is required.

Earlier research on business efforts to influence politics, the literature not only on PACs but also on regulation (e.g., Stigler 1971), suggests concentrating on the resources and coercive powers of government as they differentially affect the interests of firms in order to understand the varying propensities of corporations for political activity. Motivated by questions surrounding the foreign penetration of the American economy, we modify the standard profit-maximizing model to account for the institutional complexity of corporate political activity. Noting in particular the sensitivity to foreign business political activity, we draw out the implications of "foreignness" for the standard profitmaximizing model and examine the effect of domestic versus foreign ownership on political strategies. As Rehbein (1995, 54) argues, "future studies need to develop data sets consisting of both foreign-owned and domestic firms, so that similarities and differences can be tested directly." We take this step by identifying and comparing the political activities of foreign and domestic corporations.

Empirically, we examine a range of political activities, beyond PAC contributions, that originate from both foreign-owned and domestic corporations. Theoretically, we modify the standard profit-maximizing model of PAC contributions to include institutional effects (North 1997), extend the theory to new dimensions of corporate political activity, and extract the theoretically interesting properties of these new dimensions in contrasting domestic and foreign firms' propensities for political activity. We first discuss earlier research and our theoretical approach. We then describe the operationalization and measurement of our variables and the results of our empirical analysis.

EARLIER RESEARCH

The most important factors identified in the literature on business PAC formation and spending are firm size, the degree of government regulation of a firm or its industry, and the importance of government sales to a firm or its industry. In addition, the profit-maximization approach generally includes measures of the free-rider incentive (Andres 1985; Boies 1989; Grier, Munger, and Roberts 1994; Humphries 1991; Masters and Keim 1985; Wilson 1990) in an attempt to explain the formation and donations of corporate PACs.

Underlying this research is the assumption that corporate efforts to influence politics are perceived by managers to produce benefits for the firm, such as a friendlier regulatory environment or additional government contracts. The related literature that explores the consequences of PAC contributions and the links between contributions and legislative payoffs has produced mixed results (Frendreis and Waterman 1985; Grenzke 1989; Hall and Wayman 1990; Romer and Snyder 1994; Snyder 1992). The evidence suggests that when the payoff is defined narrowly in terms of committee or floor votes, PAC contributions have less influence. But voting, because of its visibility, is the most difficult of a representative's activities to influence. When the payoff is defined more broadly, analyses tend to support the assumption that businesses do get something in return for their political activities (Hall and Wayman 1990).

Political scientists have focused heavily on PAC formation and donations. Because data on lobbying activity are less accessible, corporate lobbying has not received comparable attention. Yet, some sociologists (Himmelstein 1997; Useem 1984), business scholars (Smith 1994), and economists (Navarro 1988) have taken a more comprehensive view of business political activity. Navarro (1998, 90) recognizes that charitable contributions may be part of "an overall lobbying strategy" and argues that profit maximizing is an "important motive driving contributions." Useem (1984, 116-8) maintains that charitable contributions should be considered a political activity and linked to both corporate and "classwide" considerations. Survey data suggest that corporate managers employ a political vocabulary to think about giving. In a survey of 400 heads of large U.S. corporations, the two most important reasons given for supporting the arts were "corporate citizenship" and the "business environment" (p. 125). Corporate giving to the arts is likely to have a disproportionate effect on elite perceptions of the corporation and may serve to increase access, in social settings, to policymakers.

Charitable giving doubtless enhances the corporate self-image for managers and employees, but the direct economic benefits are to a large extent intangible. Anecdotal evidence suggests that corporate donations to charity are used to influence public and elite perceptions of the institution and hence policy in relation to that institution. (In particular, regarding Japanese corporate activity in the United States, see Choate 1990, 142–3). According to Craig Smith (1994, 108), Arco, the oil company, "had been using philanthropy strategically since 1971, when it began funding and forming alliances with environmental groups."

A firm-level measure of U.S. corporate charitable donations was not available to Useem. We propose a systematic analysis of the motivations behind charita-

ble giving (see also Mitchell 1989) and argue that it is theoretically appropriate to treat this activity as a form of corporate political activity. If we find that the set of firms that contribute to charity is similar in some important respects to the set that lobbies and contributes to elections, then empirical confidence in this argument increases.

Policymakers respond to direct contacts and to electoral and public opinion pressures. The different activities that constitute corporate participation represent complementary options in a campaign to influence the policy process. We assume a decision structure that permits the coordination of these resources. Research on corporate PACs suggests that the company's chief executive officer (CEO), public or governmental affairs officers, and representatives in its Washington, D.C., office are key personnel in the running of the PAC (Sabato 1984, 34-5). According to Sabato (p. 126), "most PAC officials...will admit to having lengthy discussions or sharing information with their organization's lobbyists when it comes time to endorse candidates." Schlozman and Tierney (1986, 228) show that the great majority of corporations running PACs do so with "input from the Washington Office," which supports this conceptualization. Public affairs officers, CEOs, and senior managers generally determine the corporation's charitable contributions (Himmelstein 1997, 9; Siegfried, McElroy, and Biernot-Fawkes 1983). The location of campaign contributions, lobbying, and philanthropic decision making among this narrow group presents the opportunity for coordination.

THEORY AND HYPOTHESES

We begin with the standard profit-maximizing framework for explaining the different dimensions of corporate political activity. Specifically, we will analyze and compare models that predict PAC contributions, lobbying activities, and charitable donations. (See Grier, Munger, and Roberts 1994 for an "organizationally constrained profit-maximizing" model; but see Martin 1995 for related on work on the formation of firm preferences. Martin argues that various institutional factors, rather than economic interests alone, influence preferences on health policy.) Within this theoretical context, corporations are expected to use political activity to secure sales and avoid or modify costly regulations. Whereas Grier, Munger, and Roberts analyze aggregated industry contributions, our focus is on individual firms.

In their most basic form, corporate profits can be modeled as a function of revenues (which depend on prices and quantity produced) minus costs (which depend on the prices and quantities of inputs). Firms make choices about how much to produce and the combination of inputs to use based on their goal of maximizing revenues minus costs. In other words, to maximize profits, firms want to increase revenues and decrease costs. As we move from an ideal perfectly competitive market system to the realities of the current political economy, many factors affect a firm's revenues and costs, and in turn its profits. More

specifically, firms will engage in political activities to enhance revenues and minimize costs, and various factors will affect their profit-maximizing abilities and strategies.

On the revenue side, political activities may be targeted at procuring government contracts or price supports and tariffs. On the cost side, political activities may be targeted at reducing regulatory or labor costs or securing tax relief. As the different types of political activities are not equally instrumental in enhancing revenues and reducing costs, the significance of factors may vary across the types of activities. For example, lobbying is the most instrumental act, whereas charitable giving is at best an indirect route to securing benefits, such as a government contract.

As a first step, we model corporate political activities as a function of factors that directly and indirectly affect a firm's revenues or costs and hence its profits, and we derive a number of testable hypotheses based on the goal of profit maximization. Specifically:

Corporate Political Activity = $\beta_0 + \beta_1$

 \times Concentration + $\beta_2 \times$ Size + β_3

 \times Government Procurement + β_4 \times Foreignness

 $+ \beta_5 \times \text{Countermobilization} + \beta_6 \times \text{Visibility} + \beta_7$

× Government Regulation.

We expect that the performance of these factors, and the model as a whole, will vary in importance across the dimensions of political activity, as we show in the discussion of the hypotheses below.

Following the standard profit-maximizing model and consistent with earlier research (Andres 1985; Boies 1989; Grier, Munger, and Roberts 1994; Masters and Keim 1985), we argue that the likelihood of corporate political activity depends on the availability of the necessary resources and degree of government involvement. We hypothesize that, in general, political activity will increase with corporation size, government regulations, sales to the government, and industry concentration, but these factors may differ in their degree of importance across the dimensions. (High industry concentration lowers the incentives to free ride, assuming actors share a common and industrywide goal, and lowers information costs.)¹

We argue that this standard model may be improved by incorporating institutional influences on the incentive to participate. Drawing on insights from the participation and group literatures, we represent these influences with measures of the visibility of the corporation, the foreign or domestic source of corporate activities, and the degree of political countermobilization. We hypothesize that the likelihood of corporate political activity will increase as institutional visibility increases because the corporation is likely to attract the attention of other interests and of policymakers, which could raise (regulatory) costs and negatively affect

profits. In order to counter the threat of a public policy backlash, all forms of corporate political activity will increase as visibility increases.

Visibility is an important factor for the corporation as an institution, and it is also a theoretically important concept for the analysis of political activities. Lobbying is a less visible activity than federally monitored campaign contributions and charitable giving. Generally, corporations prefer less visible rather than more visible methods of influence (Schattschneider 1960, 40). Visible activity may generate opposition and stockholder concerns, and unlike membership-based interest groups, these institutions do not have to rely on widely publicized successes to recruit members and raise funds (Gais and Walker 1991). Moreover, the visibility of political activities is a particular consideration for foreign firms.

The conventional wisdom is that foreign corporations commit more resources to political activities than do domestic corporations (Choate 1990; Prestowitz 1988; Tolchin and Tolchin 1988). We theorize that foreign affiliates adapt to the host political economy (Mitchell 1995; Mitchell, Hansen, and Jepsen 1997; Pinto-Duschinsky 1981; see also Rehbein 1995). The forces that produce political activity by domestic firms will do so for foreign firms (for an alternative theoretical argument, see Pauly and Reich 1997). If foreignness does make a difference, we hypothesize that it will affect PAC activity and to some extent charitable giving, rather than lobbying. Given the greater visibility of PAC contributions, foreign firms will be, ceteris paribus and contrary to the conventional wisdom, less likely to contribute because of concerns about the perception of interfering in the politics of another country. Although PAC contributions from U.S. affiliates of foreign corporations are formally permitted under campaign finance regulations, legitimacy questions arising from foreign ownership constitute an informal institutional constraint, which amounts to observing a norm of behavior (North 1997, 6). This institutional factor should be less salient for less visible political activities, such as lobbying. Charitable giving is not very obviously a self-interested activity, but it still may be perceived as interference and so is more risky for foreign firms; again, we hypothesize that foreign firms will be less likely to contribute to charity than domestic firms.

Another theoretically important characteristic of political activity is its instrumentality in communicating a narrow goal. The greater the visibility of an activity, the greater is the difficulty of tying it to narrow, "private," interests. Lobbying conveys most information to policymakers concerning policy preferences, is most instrumental, and is most likely to result in an exclusive benefit, such as regulatory relief or a government contract (analogous to citizen contacting; see Leighley 1995). The expected benefits of PAC contributions are broader, as the noncontributing corporation cannot be excluded from the benefits of electing a probusiness candidate. If the contribution is targeted at a candidate who has the prospect of an important committee assignment, then it may result in improved policy

¹ For additional insights into understanding economic approaches to corporate political activity, particularly lobbying, see Alt et al. 1999.

access and a narrower benefit for the particular corporation. Yet, both giver and receiver must at least pretend a broad not narrow benefit. Charitable contributions convey little information about policy preferences, have an indirect effect on policymakers, and are not likely to influence firm-specific contracts and regulations. Because lobbying is the least visible and the most instrumental of the different activities, foreignness should make the least difference with respect to lobbying.

An additional difference among these activities is that, in contrast to lobbying, PAC contributions and charitable donations may be solicited from the corporation as well as initiated by it. Solicitation should affect which candidate or charitable organization receives a contribution but not the overall resources the corporation allocates to these activities.2 We are modeling the overall amount the corporation contributes, not the choice among candidates or causes. For example, AT&T's PAC conforms to this dual process: Separate committees are responsible for the PAC funds and their disbursement (Mutch 1994). For charitable contributions, Smith (1994) describes changes in corporate allocations for philanthropy as a function of internal decisionmaking and market conditions, not solicitation pressures. He illustrates the importance of those pressures for disbursement decisions, however: AT&T "caved in to demands from the Christian Coalition to deny funding to Planned Parenthood" (p. 110).

We also consider the degree to which there is potential or actual political countermobilization. In an analysis of the Bork nomination, Austen-Smith and Wright (1994) show that lobbying, even by "friendly" legislators, will increase to counteract the efforts of opposing groups. Mobilization of competing interests may differ across types of industries (e.g., according to degree of unionization, type of products, environmental effects, or the like). Corporate political activity is likely to increase to offset the potential costs of mobilization (Martin 1991; Truman 1951, 79; Vogel 1989, 293; Wilson 1990).

DATA AND MEASURES

We focus on large firms potentially interested in national politics. These may vary considerably in size, from sales of \$91 million to \$121 billion (\$500 million for the smallest Fortune 500 company). Data on Fortune 500 corporations were used in earlier analyses of domestic corporate political activity (e.g., Boies 1989; Humphries 1991; Masters and Keim 1985, 1986). We examine financial contributions, lobbying, and charitable donations of Fortune 500 companies for 1988. In addition, we include the largest U.S. affiliates of foreign firms listed in Forbes (1989), which covers the financial and service sectors as well as manufacturing. For our purposes, we limit foreign firms to those in manufacturing to ensure comparability with the Fortune data. Corporate PAC contributions to federal election candidates is for the 1987-88 cycle (Almanac of Federal PACs 1990; Federal Election Commission 1989; Makinson 1992). Data on PAC contributions by domestic affiliates of foreign corporations are available from the Congressional Research Service, but only for the 1987–88 cycle (Walke and Huckerbee 1989). The Congressional Research Service report provides a useful means of verifying the identification of politically active affiliates.

Appendix A provides a detailed description of the data. More specifically, Table A-1 lists each variable, how it is measured, and the sources of data. Table A-2 gives statistics for all dependent and independent variables:

For lobbying, we collected 1988 data on the number of corporate representatives in Washington, D.C., offices as well as the number of consultant or counsel offices retained by the corporation in the capital. These data measure the potential for lobbying by each firm.³ We also collected data on corporate testimony for congressional hearings. Annual financial data on charitable contributions by company are available in the *Corporate Giving Directory* (1991). Major charitable contributions (more than \$500,000) include both company and foundation giving as listed under the "How much they give" category. For entries that state a range (e.g., \$500,000 to \$1,000,000), the lowest figure was used.⁴

For the independent variables in the explanatory model, we use firm size as an indicator of political visibility. The larger the firm, the more likely it is to attract the attention of government regulators as well as other institutions and groups, and regulation can affect a firm's costs. More generally, and particularly for large data sets that include firms smaller than the Fortune 500, firm size is an indicator of resources. Firm size is measured as the log of dollar sales and is available in the annual "Fortune 500, The Largest U.S. Industrial Corporations" (Fortune, April 24, 1989, 10-30) and "The 100 Largest Foreign Investments in the U.S." (Forbes, July 24, 1989, 313-8). In addition, we use the number of company citations in the Wall Street Journal and the number of negative articles, available through WESTLAW and Lexis-Nexis, as measures of visibility. Specifically, we use the log of the number of times the company name appeared in the story and title of an article during 1983–87 and the log of the number of negative articles for 1987. The effect of free-rider incentives is measured using industry concentration ratios. Higher concentration lowers organization and information costs and should have a positive effect on political activity.

For corporation sales to the government, which

² We thank a reviewer for drawing this process to our attention.

³ Ideally, we would like to use actual lobbying expenditures by firms. Although these data are available under the Federal Regulation of Lobbying Act of 1946, evidence suggests that there is gross underreporting. A recent General Accounting Office study compared lobbyist registration under the 1946 Act and the modified Lobbying Disclosure Act of 1995; it found 10,612 organizations and individuals registered in 1996 under the later act who had not been registered in 1995 under the earlier act (GAO, Comparison of Lobbyists' Registrations B-274543.)

⁴ Since charitable giving is highly skewed, we use the log of dollar contributions.

enhance firm revenues and hence should be positively related to political activity, we use the log of the dollar amount of defense contracts and, at the industry level (based on U.S. Bureau of the Census four-digit SIC codes), the log of the dollar amount of industry sales to the federal government weighted by total industry sales. Regulations generally raise a firm's costs, which induces political activity to counter those costs. Regulation is measured at the firm level by corporate interactions with the federal courts in regulatory cases and with major regulatory bodies (EPA, OSHA, CPSC, FERC, NLRB, FDA, FTC, and the Antitrust Division of the Department of Justice). The SIC pollution abatement expenditures for 1988 are used to measure regulation at the industry level.

There are 31 foreign firms among the *Fortune* 500. In addition, we oversampled for foreign firms by collecting data on 70 U.S. manufacturing subsidiaries listed in *Forbes* (1989). Foreign firms are identified in the analysis with a dummy variable.⁶

Countermobilization typically increases costs for a corporation, 50 firms have an incentive to counter with increased political activity of their own. The mobilization of countervailing interests is measured at the firm level by union PAC and lobbying activity, matched to firms by examining bargaining agreements. Because of multicolinearity problems, we combined the PAC and lobbying measures in a countervailing power index that used each firm's share of total union PAC money and each firm's share of total union lobbying. At this stage we do not have data on environmental and consumer groups (Vogel 1989, 293). Finally, for charitable donations, the number of plant locations is included as a control variable; philanthropy is not necessarily focused on the national level, in contrast to PAC and lobbying activity, and it is likely that corporations with facilities in multiple communities will make more donations.

ANALYSIS AND RESULTS

Of the 565 firms in our data set, 72.6% engage in some form of measurable political activity at the national level. Lobbying is the most common—54.6% have representatives in Washington or retain counsel there. Roughly half (292 corporations, 51.6%) have PACs, and 215 firms (38%) gave \$500,000 or more to charity. Restricting the analysis to the domestic Fortune 500, 56.4% lobby, 54.6% have PACs, and 42.2% give to

6 The 495 Fortune 500 companies (data are missing on five) plus 70 foreign affiliates total 565 corporations in the analysis.

charity. Because earlier research did not examine the other modes of participation, only the PAC figure can be compared, and it is in keeping (Boies 1989, 821; see also Andres 1985, 213). Contrary to the popular view, foreign firms are not hyperactive politically. Compared to domestic firms, foreign-owned affiliates lobby less (38% versus 56%) and are less likely to have PACs (32% versus 55%), and fewer give to charity (13% versus 43%). Foreign-owned firms are less likely than domestic firms to engage in any of the three activities, with the differences more pronounced for PAC and charitable giving, the more visible activities.

Scholars have commented, particularly with regard to PAC formation, that it is surprising how many Fortune companies are not politically active. Sabato (1984, 32) terms these the PAC holdouts. In addition to noting the variation in government involvement across industries, Sabato reports the results of a telephone survey of Fortune 500 companies without PACs and identifies a mix of motives, including concerns about perceived corruption, hostile public reactions, the belief that business should not be involved in politics, and reliance on trade associations for such activity (pp. 32–3; see Makinson 1992 for data on trade association PAC contributions).

Although there is considerable variation in size among the Fortune 500, almost all the 200 top ranked are involved in some form of political activity. The nonactive firms are concentrated in the bottom threefifths of the list. Among the top 100, not until number 67, Hanson Industries, does one find neither PAC, nor lobbying, nor charitable contributions. Hanson is foreign-owned, has no defense contracts or shipments to the government, and has no measured interactions with federal regulators. The next total "holdout" is Agway, at Fortune rank 124, which also has no defense contracts or government shipments and no measured interactions with federal regulators. Both operate in industries with relatively low concentration and low expenditures on pollution regulation compliance, and both had relatively few Wall Street Journal citations.

Among the politically active firms, General Electric and Philip Morris are near the top on all dimensions. The former, which ranks fifth among the Fortune 500, is very visible as measured by Wall Street Journal citations, is highly concentrated and highly regulated, and has large defense contracts and shipments to the government. The same is true for Philip Morris, which ranks tenth, in terms of visibility, concentration, and regulation. It was the largest of the PAC contributors in the 1987–88 election cycle, distributing a total of \$623,380. General Electric has the largest number of lobbyists

⁵ In creating this variable, we used WESTLAW's online electronic database to gather information on the total number of interactions of each corporation with the federal courts, the Antitrust Division, and each of the seven major regulatory agencies: Environmental Protection Agency, Occupational Safety and Health Administration, Consumer Product Safety Commission, Federal Energy Regulatory Commission, National Labor Relations Board, Food and Drug Administration, and Federal Trade Commission. By "interaction" we mean court actions and a number of different types of regulatory agency actions, including adjudicative decisions, consent orders, interlocutory orders, and opinion letters regarding requests, such as legal exemptions.

⁷ We also compared the means of our independent variables for active, inactive, and partially active firms. For example, for size and regulation, corporations that engage in only one activity lie in between those active on all dimensions and those that are inactive. Average sales for firms active on all three dimensions are \$9.5 billion, inactive firms have average sales of \$980 million. Firms giving only to PACs have average sales of \$1.4 billion, those that only lobby have average sales of \$1.8 billion; and those that only give to charity have average sales of \$1.7 billion Results are similar for the regulation variable.

TABLE 1. Top Ten Most Politi Corporations among Fortune 5 Affiliates, 1988

(34 representatives in the Washington office, consultants, or counsels retained); Philip Morris is second with 28. IBM is the largest of the contributors to charity.

Even when the focus is restricted to the top ten most active corporations in each category, as shown in Table 1, there is the suggestion of overlap among the forms of activity. Including all the firms in the analysis reveals that those active in one category are likely to be active in the others.

To examine the overlap among the forms of political activity, Table 2 presents cross-tabulations of firms with PACs and those with lobbyists, firms with PACs and charitable contributions, and firms with lobbyists and charitable contributions. As can be seen in Table 2A, many more firms with PACs have a lobbying presence in Washington than do firms without PACs, and the 42% difference is easily large enough to reach statisti-

TABLE 2. Cross-Tabulations of Lobbying, PAC Formation, and Charitable Giving by Fortune 500 and Foreign Affillate Corporations, 1988 A. cal significance. Firms with PACs are also more likely to make charitable donations—55% compared to 20% for firms without PACs (Table 2B). A similar, statistically significant relationship holds between lobbying and charitable contributions (Table 2C).

To "understand" one activity as a "quantitative indicator of a range of other corporate political activity" (Su, Neustadl, and Clawson 1995, 23) would be mistaken. Although the activities are not perfectly correlated, however, the forms of activity are clearly associated. The results for charitable contributions provide empirical support for the claim that this should be considered a form of political activity. We are interested in the relationships among these activities both as components of a campaign to influence politics and policy and as outcomes of the economic and political forces at work on the firm.

Through multivariate analysis, we investigated the amount of participation in the three forms of political activity. The regression models in Table 3 display the findings.⁸ For each dependent variable, a substantial number of firms decided not to participate politically. These nonparticipants present a problem of sample selectivity. A solution is to use the Heckman (1976, 1979) correction, as suggested by Grier, Munger, and Roberts (1994). The procedure adds another regressor, known as the inverse Mill's ratio, which is obtained

 $^{^{8}}$ N=555 because ten foreign firms had missing values on the sales data and were excluded.

from probit models. We define the new regressor, λ , as $f(Z_i)/F(Z_i)$, where $Z_i = X_i\beta$ from probit models. As Table 3 shows, λ is significant in all three models, which suggests the need to correct for self-selection.⁹

Consistent with earlier research on PAC contributions, the variables that constitute the standard profitmaximizing model influence all forms of political activity. Firm size (Size), operationalized as the log of dollar sales, is a significant positive influence on all three forms of political activity. This is similar to the PAC contribution findings of Andres (1985), Boies (1989), Humphries (1991), and Masters and Keim (1985). In addition to size, measures of government

involvement with a corporation are included in the standard profit-maximizing model.

Corporation sales to the government, measured at the firm level by the log of the dollar value of defense contracts (*Defense*), have a significant positive influence on decisions about how much to give to candidates and on how much to lobby, but they are insignificant in predicting charitable contributions. When government procurement is measured at the industry level by government shipments as a ratio of total shipments (*Government Shipments*), it is also significant in the PAC and lobbying models. Government procurement offers the most individualized of benefits to firms, encouraging them to focus on the more "instrumental" forms of political activity, rather than charitable giving.

There is evidence to support the influence of government regulation, whether measured at the firm or the industry level. Company interactions with regulatory agencies and courts (*Regulation*) and the industry-level measure (*Pollution Expenditures*) are positive and

⁹ Heckman's two-step correction is most appropriate for the model on PAC giving, but it could be argued that Tobit is more appropriate for charitable giving, which is consored data (we only observe contributions of \$500,000 or more). Green (1993, 697) suggests that Heckman's two-step correction is a consistent alternative to maximum likelihood estimation. We also obtained the Tobit results for each model for comparison. These were largely identical to the Heckman models, so for brevity and ease of comparison we present only the Heckman results.

significant in explaining both PAC giving and lobbying. Neither regulation measure is significant in the charity model, contrary to expectations. This may again reflect the difference in instrumentality among the different types of political activity.

An interesting mix of results for industry concentration emerged in earlier research. Andres (1985), Grier, Munger, and Roberts (1994), and Masters and Keim (1985) found a significant relationship between industry concentration (or number of establishments in an industry) and PAC activity. Boies (1989), Humphries (1991), and Rehbein (1995) found that industry concentration does not have a significant effect on PAC formation and activity. Even though there is a severe measurement problem because firms in our sample are often active in multiple industries but are constrained to one industry concentration value, we find that industry concentration (Concentration) is significant in the lobbying model but not for PAC contributions or for charitable giving. ¹⁰

The combined effect of union PAC contributions and lobbying efforts (Union Activity) has a significant positive influence on PAC contributions and amount of lobbying, but it is not significantly related to charitable giving. Visibility, as reported in Table 3, is measured by the log of the total number of Wall Street Journal citations (Wall Street Journal). This variable is significant for lobbying and charitable donations but not for PAC contributions (see Appendix B for a discussion of the potential for endogeneity, particularly regarding PAC giving). Firm size, too, can be interpreted as a measure of visibility as well as resources. Given the nature of our sample, all the firms are likely to have the resources to become politically active. There is a strong correlation between Wall Street Journal citations and firm size (.58).

Foreign ownership, a dummy variable with the value of 1 for U.S. affiliates of foreign companies and 0 for domestic firms (Foreign Ownership), significantly decreases the likelihood that a firm will give PAC contributions to candidates for federal elections, but it has no effect on lobbying. The insignificant difference between foreign and domestic corporations regarding lobbying fits with our hypothesis that foreign-owned firms adapt to the local political environment in the less visible forms of activity.

For charitable donations, the number of plant locations is included as a control variable (*Number of Plants*). It is likely that corporations with facilities in multiple communities will make more donations. In the regression analysis, number of plants is not significant

in explaining charitable contributions (although it is significant, $p \le .001$, when a Tobit model is used).

In disaggregating the dimensions of business political participation, we isolated the theoretically interesting properties of visibility and instrumentality and expected the importance of the different variables to vary across these dimensions. The results support this expectation. Overall, our modified profit-maximizing model explains most variance $(R^2 = .64)$ when the dependent variable is lobbying, the most instrumental and least visible activity. For the least instrumental activity, charitable giving, the "narrow" interests of the firm measured by defense contracts, government shipments, regulation, concentration ratios, pollution expenditures, and countermobilization have no significant influence. The varying effect of foreign ownership is another component of this argument, based on the view that foreign firms prefer to avoid visible activities. They are as likely to lobby as domestic corporations but are less likely to contribute to campaigns, and there is some evidence that they are less likely to give to charity.

Finally, we test and correct for endogeneity in three of our independent variables. Specifically, our measure of countermobilization, the *Wall Street Journal* citations, and regulation variables all pose a potential problem of endogeneity. Appendix B describes the various techniques that we use. The *Wall Street Journal* and regulation variables are affected in our PAC model, but overall the correction generally improves the performance of our model and lends support to our theoretical argument (see Appendix B and Table B-1).

One possible weakness in our results stems from the fact that we measure corporate readiness for lobbying activity rather than actual lobbying. We do not have a dollar measure of lobbying comparable to that of PAC and charitable contributions. As a further step to confirm our findings, we looked at one other measure, the number of appearances by firms at congressional hearings to lobby for or against legislation. These results largely substantiate our other findings and further support our theoretical expectations.

The model of congressional hearing appearances in Table 4 performs comparably to our other models. Size remains important. Government procurement at both the firm and industry level is significant. Both firm and industry measures of regulation are significant, as is our measure of countervailing power. Most interesting is the negative and significant coefficient for foreign ownership. We have argued that foreign firms will behave in a similar way to domestic firms in terms of lobbying, which is a narrow benefit, low visibility activity. For other modes of political participation, which might give the appearance of interfering in the politics of the host country, foreign firms are less likely to be active. This measure of lobbying provides results that support the general argument about the importance of institutional factors. Because appearing at a congressional hearing is a far more public and visible form of lobbying than hiring a Washington lobbyist, foreign firms are less likely to engage in this type of behavior. Lobbying is itself a collection of activities.

¹⁰ This problem is also present for government shipments and the pollution expenditures measure, as they rely on SIC codes.

¹¹ It is plausible to expect that negative publicity, rather than the total number of articles, is what drives business political activity, but when we included visibility measured by the number of negative articles in the same models, it had no significant effect. The correlation between the number of citations and the number of negative articles is .50. If we only use our measure of negative publicity, it is also insignificant in all models.

¹² In the Tobit model, foreign ownership also significantly decreases the likelihood of charitable contributions $(p \le .001)$.

CONCLUSION

We began by suggesting that corporate political participation includes various dimensions of activity, one dimension of activity is not necessarily a good proxy for all forms, and the different dimensions have differences in the theoretically interesting properties of visibility and instrumentality. We argued that firms engage in political activities to exploit political opportunities to enhance their revenues and reduce their costs. But other interests also mobilize to influence the use of government resources and coercive powers that influence firm profits. The size (and therefore the visibility) of the firm increases the likelihood of public attention, mobilization, and policy activity. Our examination of

the amount and type of political activity by corporations was motivated in particular by questions surrounding foreign penetration of the American economy.

Lobbying, PAC activity, and charitable donations linked to foreign corporations are politically significant issues that have attracted considerable attention in recent years (Choate 1990); there are even fears of a "fifth column" (Graham and Krugman 1989). Although it was a key issue in the 1996 presidential election, such foreign activity has not attracted the scholarly attention it deserves. We have presented systematic data on corporate political activities that permit direct comparison between domestic and foreign-owned corporations and allow us to reach firmer conclusions about the dimensions, particular motivations, and relative significance of foreign-based political activity within the United States. Including foreign firms in the analysis helps illustrate some real differences among the forms of political activity. Contrary to conventional wisdom, this evidence suggests that foreign corporations are less likely to contribute to candidates and are less likely to engage in public lobbying by appearing at congressional hearings, but they are about as likely as domestic firms to have a lobbying presence in Washington. The evidence on charitable contributions provides some support for a lower propensity toward donations by foreign-owned firms. The comparatively low level of political contributions by U.S. affiliates of foreign corporations is consistent with Pinto-Duschinsky's (1981, 232) observation that foreign firms in Britain are less likely to make political contributions. We found evidence that foreign firms adapt to local behavior but at the same time try to avoid the appearance of influencing the politics of another country.

The data set that we used is more extensive than in earlier studies, but further measurement refinements are needed. In terms of the independent variables, we improve on the earlier, cruder, industry-level measures of regulation, and we incorporate an ownership measure, a countervailing power measure, and press measures of visibility. Yet, our dependent measures for lobbying do not include dollars spent, comparable to our measures of PAC and charitable contributions, and our PAC measure needs to be expanded to stay current with the shifting patterns of electoral finance, including soft money. Also, associational political activities are not covered in the firm-level models, and the issue of whether associational activity is a substitute for or complement to political activity at the firm level remains to be addressed. Further analysis and better and more comprehensive data may help clarify some of the contrasts and similarities among the forms of political activity and may support the argument that corporate political activity, whether domestic or foreign, is complex and multidimensional.

APPENDIX A

	Measures and Sources	<u> </u>
Variable	Measure	Source
PAC contributions	PAC's total contributions to candidates in dollars	Federal Election Commission 1989; Almanac of Federal PACs 1990; Makinson 1992
Representation	Washington office staff, counsel/law firm(s) retained	Washington Representatives 1990
Charitable contributions	Donations by firm in thousands of dollars	Corporate Giving Directory 1991
Size	Sales in millions of dollars, logged	Fortune, April 24, 1989, pp. 10–30
Foreign ownership	0 = U.S. company 1 = foreign parent	Angel various years; Walke and Huckerbe
Defense.	Defense contracts in thousands of dollars, logged	U.S. Department of Defense 1987
Government shipments	Shipments to the federal government divided by total industry shipments at the 4-digit SiC code level in millions of dollars, logged	U.S. Bureau of the Census 1987a, 1987c
Union activity Index	Union PAC expenditures and lobbying, for firms with bargaining agreements	American Directory of Organized Labor 1993
Pollution expenditures	Expenditures by 4-digit SIC in millions of dollars, logged	U.S. Bureau of the Census 1988
Concentration	4-digit SIC concentration ratios	U.S. Bureau of the Census 1987b
Wall Street Journal	Logged number of Wall Street Journal citations, includes number of times the corporation is mentioned in the title or body of an article	WESTLAW
Regulation	Logged number of Interactions between firms and the EPA, OSHA, CPSC, FTC, FDA, FERC, NLRB, the Department of Justice, and federal courts on regulatory matters (see note 5)	WESTLAW
Hearings	Number of appearances by firms at a congressional hearing	Congressional Information Services Inc. 1987–88
Plants	Logged number of plants with 100+ employees	Marketing Economics Key Plants 1986-87

APPENDIX B

We are grateful to anonymous reviewers for pointing out potential endogeneity problems in three of our independent variables—union activity, regulation, and Wall Street Journal citations—and for the suggestion of using an event count model for the analysis of hearing appearances.

We recognize that union activity, as a measure of countermobilization, is endogenous by definition. Regulatory contacts and visibility, measured by Wall Street Journal citations, may be a function of past or present firm activity. We test for endogeneity in three ways. First, we created instrumental variables for our potential endogenous independent variables using size, government procurement, and industry dummy variables at the two-digit SIC level as explanatory variables. Although our results overall are not significantly different, due to multicolinearity, size (a major factor in predicting

political activity) becomes insignificant; in particular, the correlations between size and the instruments are .94 for the Wall Street Journal, .64 for union activity, and .92 for our regulation measure.

Second, we substituted industry dummy variables at the two-digit SIC level for the three potential endogenous variables. These dummy variables pick up some of the differences captured by the three variables left out of the models, and the results for the other variables do not change, which gives us some confidence that our models are otherwise sound.

Third, in order to include the potentially endogenous variables and test and correct for endogeneity, we used the method suggested by Smith and Blundell (1986). We regressed each of the potentially endogenous variables on all the other exogenous variables in the model along with the two-digit SIC industry dummy variables, and saved the residuals from each of the three models. Then we included these residuals in our original models. If the residuals are significant, endogeneity is present. Due to multicolinearity, this test does not work for the union activity measure. Specifically, 497 out of 555 firms (90%) have no union activity by our measure. The large number of zeros in the union activity variable makes the error term highly colinear with the original measure (.87), but the small union response suggests limited endogeneity. In other words, if unions were responding to corporate political activity, we would be unlikely to

observe 90% with no activity, when more than 70% of the firms are politically active.

The results for the inclusion of the residuals for the Wall Street Journal variable and the regulation variable do confirm an endogeneity problem in our PAC model. In Table B-1 we report the results of the Heckman-corrected regression model with the included residuals. As the results show, one measure of visibility, Wall Street Journal citations, becomes negative and significant, and the residual from the Wall Street Journal model is significant, which indicates an endogeneity problem. In testing and correcting for endogeneity in this way, the significance of the other variables in the model is generally improved.

Interestingly, the endogeneity result in some ways supports our theoretical argument regarding visibility. We view PAC giving as a more visible political activity, so visibility being a function of PAC activity, as opposed to other types of political activity, indirectly lends support to our claim that the activities differ along this dimension.

For the analysis of hearing appearances, we test our model using negative binomial regression since it is a count variable. The results in Table B-2 differ slightly from the Heckmancorrected regression in Table 4. In particular, the two industry-level measures, government shipments and pollution expenditures, are no longer significant. Overall, our results appear fairly robust across the different methods of estimation.

Recovering the Political Aristotle: A Critical Response to Smith

RONALD J. TERCHEK and DAVID K. MOORE University of Maryland, College Park

Thomas Smith presents an Aristotelian view of the common good that resembles much contemporary political theory in that it focuses on ethics rather than politics. Smith contends that Aristotle is a potent remedy to a society in crisis due to its unconcern about the common good. Against Smith's apolitical reading of Aristotle, we examine how Aristotle's views of common advantage, the multiple needs of citizens, and political friendship support neither harmonizing conceptions of the good nor a personal "radical conversion" that makes the common good our primary political concern. In engaging the political Aristotle, we find instead that he is concerned with the necessary conflict that resists attempts to arrive at the common advantage, with the material basis of good citizenship, and with the institutions and practices that foster a good deliberative politics.

homas Smith's (1999) recent account of Aristotle is puzzling in that it seems to neglect almost entirely the messy business of politics and focuses instead on "a radical conversion" (p. 628) of disparate, inwardly focused individuals into citizens who have attuned themselves to a harmonized conception of the good. Aristotle is made into something he is not in Smith's oversimplified readings of the common good as well as his tendency to collapse (rather than integrate) the distinctions between the Nicomachean Ethics and the Politics and between moral and political friendship. This is done in such a way that the Politics and political friendship are largely withdrawn from Aristotle's political thought. Aristotle is reduced to a purely ethical thinker rather than a nuanced political theorist who has much to tell about our attempts at good politics. By addressing these problems in Smith's reading, we find an Aristotle who tells us not that we must harmonize our thinking to some shared conception of the good or be simply less overreaching, as Smith thinks. Rather, Aristotle is concerned with the constitution of the polis and the formation of crucial institutions and practices that support deliberative citizens and the public sphere. We also find that Smith's Aristotle is indifferent to why citizens, with all their differences, can become good citizens and why the institutional arrangements of the good republic are essential to its survival and flourishing.

According to Smith (1999, 628), we need to recognize that Aristotle wants to remove injustice and that "the cure of injustice is personal reorientation." On Smith's reading of Aristotle, family and friends can serve as a foundation for such a reorientation (p. 629), and "the common good in the family and politics" are analogous (p. 632). This we dispute.

We argue that Smith makes Aristotle's politics static and misses the disputes that mark his democratic politics. Our reading focuses on matters that are essential to both Aristotle's good politics and his good polity, matters that Smith largely ignores. One piece missing from his interpretation is the economic security and political autonomy of citizens in Aristotle's good polity, goods that Aristotle thinks provide them with stakes in their republic and its well-being. Because Aristotle's politics reflects the diversity of citizens and their possessions, any agreements about the common good and justice are matters of negotiation and always subject to revision in the good republic. Finally, we show that, although Smith wants to separate himself from liberalism, he reveals an affinity to a liberalism that emphasizes moral individualism and is indifferent to the institutional foundations that Aristotle thinks are so necessary to human flourishing and good citizenship.

THE COMMON GOOD

For Smith (1999, 626, 628), Aristotle sees injustice as what stands in the way of the common good and is pessimistic that injustice can be easily overcome. Smith leads us through an account of this central problem (which we take up later) and of remedies that ask us to reorient our thinking in moderate, just ways (p. 628). The shift from an account of the common good, with injustice as its paramount obstacle, to Aristotelian solutions for overcoming the obstacle moves too quickly over Aristotle's more complicated understanding of the dilemmas of a politics that aims at some common advantage.1 Smith's conception of the common good in Aristotle largely misses the ways in which Aristotle problematizes it. Although Smith does not believe the common good is unproblematic, he underrepresents its problematic nature and in doing so removes much that is crucial to understanding Aristotelian politics. For Aristotle, the "common good" is at best a paradoxically unattainable goal rather than something that requires us to overcome one tenacious obstacle. The difficulty is not (just) correcting injustice; as we will show, justice, equality, and the ends of politics (happiness of citizens) necessarily resist the possibility of a common good in any city.

Ronald J. Terchek (rterchek@gvpt.umd.edu) is Professor of Government and Politics and David K. Moore (dmoore@gvpt.umd edu) is a doctoral student, Department of Government and Politics, University of Maryland, College Park, MD 20742.

We thank the anonymous reviewers for their thoughtful and helpful comments.

¹ We use this term to characterize Aristotle's concern with the good of the whole, despite necessary conflict, so as to distinguish it from Smith's use of the "common good," with its flavor of homogenization. For a view of what might be considered the common good that departs significantly from Smith's view and is congenial to our presentation of a common advantage, see Nussbaum 1990, 209.

Smith does not contend that Aristotle tells us what the common good is, but he fails to explore how Aristotle's examination of the good life, happiness, the virtues, justice, and equality all point to necessarily conflicting conceptions of these goods when we move beyond the individual to the city. There is certainly no ideal form (eidos) as there is in Plato (NE 1096a11-1097a14).2 Instead, Aristotle begins each investigation in a manner similar to his treatment of happiness: "Most people virtually agree . . . both the many and the cultivated call it happiness, and suppose that living well and doing well are the same as being happy. But they disagree about what happiness is" (NE 1095a17-21). As in all his investigations, Aristotle is not satisfied with allowing conventional belief to stand untested; he subjects it to the scrutiny of reason in order to move us beyond our uncritical assumptions. What he finds, time and again, is not that convention is wholly wrong but that "it is reasonable for each group to be not entirely in error, but correct on one point at least, or even on most points" (NE 1098b28-9). Aristotle does not provide a way to bridge entirely the initial conflict of convention through reason and, as his critique of Platonic forms shows, does not believe it either possible or prudent in the realm of the study of human action and ends (NE 1096b30-5, 1097a8-14). As long as differences in perspective remain, the good remains politically contested.

What is the source of these different perspectives? Some difference clearly comes from the poor habituation of some individuals,³ but for Aristotle some of the sources of difference that resist better habituation, and thus resist resolving disagreements over the good, derive from our material lives. Not only are some of us rich, some poor, and some middling, but also our occupations give us certain interests, certain capacities, and certain perspectives.⁴

Smith (1999, 633) notices that the political community may be a site for conflict but believes the way to reduce the conflict (and thereby increase the common good) is to inculcate the virtue of equity, which combines justice with the awareness of when unjust laws must be "straightened out." The problem is that so

long as the fundamental differences are not resolved, and Aristotle thinks they will not be, there cannot be a collectively held sense of what that "straightening" should look like.

Focusing on justice in Aristotle, we find that in political associations the mean of the virtue of justice is proportionately based on desert (NE 1132b21-1135a15), but desert is an inherently contestable concept. Aristotle states: "While there is agreement that justice in an unqualified sense is according to merit, there are differences, as was said before: some consider themselves to be equal generally if they are equal in some respect, while others claim to merit all things unequally if they are unequal in some respect" (P 1301b35-9). Because neither arrangement is wholly right nor wholly wrong, a good regime will attempt to see the legitimacy and limitations of both views and attempt to arrange politics so that these factions enter into constructive negotiation rather than risk intense civil conflict (P 1301b39-1302a15, 1318a27-b1). Aristotle further encourages regimes to foster the growth of the middle classes, who he thinks better see the merits and limitations of the two extremes (P 1295a33-1296a21).

Smith's neglect of these Aristotelian concerns seems largely to assume that a middle-class society is already in place and that the constitutional arrangements for the regime are unimportant. For Smith's Aristotle, a good politics rests almost entirely on people reorienting themselves away from injustice and at the same time refusing "to push their 'just' claims too far" (p. 633). Certainly, Aristotle stresses the importance of moderation in both the personal and political and believes that politics can be improved for the better habituation of citizens to virtuous views and actions. Yet, Smith's account suffers two critical problems: (1) It constructs Aristotle's political thought without his Politics and (2) it neglects Aristotle's larger concern with moving politics and ethics away from mere belief to something more reasoned.

As for the first problem, in the History of Animals Aristotle states that humans pursue both common and individual ends, and he implies that human communities are about the common good (H 487b33-488a10).5 This seems to correspond to Smith's reading of communities but not to the account we get from Aristotle's Politics. Here we find that "man is much more a political animal than any kind of bee or any herd animal... man alone among the animals has speech [logos]" (P 1253a8). Humans pursue both individual and common ends in their communities, and the human political community distinguishes itself from animal communities by reasoned deliberation "rather than on simple devotion to the common good" (Yack 1993, 52).

When Aristotle turns to how to improve the regime in order to help its citizens live well, he does not concern himself with tutoring personal reorientation but focuses instead on what conditions will best sup-

³ We use this term for lack of a better alternative, although "habituate" has an unfortunate connotation of passivity. Included in the habituation to the good life, as Aristotle conceives it, is the desire to be political, to listen and engage one another

² To remain consistent with Smith's style, references to Aristotle's works will be incorporated into the text with the Bekker pagmation preceded by an abbreviated reference to the work: Eudeman Ethics (EE), History of Animals (H), Nicomachean Ethics (NE), Politics (P), and Rhetoric (R) We use the translations listed in our references (Aristotle 1984a, 1984b, 1991, 1992); of the two editions of the NE listed (Aristotle 1985, 1990), we use the Irwin (1985) translation.

³ We use this term for lack of a better alternative, although "habit-

⁴ For the role of occupations, see Aristotle's discussion of the different types of democracy (P 1290a30-1292a39). Stephen Salkever finds that Aristotle not only sees diverse individuals comprising the polls but also holds that each individual has a complex, unique set of needs. These competing needs or interests cannot be distilled into some brew called the common good Rather, their integrity is best protected with a democratic politics that refuses to make one judgment dominate the rest and recognizes that "moral and political problems" are characterized by "their indefiniteness" (Salkever 1990, 138).

⁵ We are drawing from the nuanced description of Aristotle's political community in Yack 1993, 51-87.

port citizens in a reasoned, deliberative politics to settle their differences. In his explicit political theory (found in the *Politics*), he turns not to ethical solutions but to constitutional arrangements, concerns about power, and the material and educative conditions necessary for citizens to engage in better deliberative politics. He believes political communities are characterized by inevitable conflict, so attempts to arrive at agreements for the common advantage require much more than a change of thinking; in attending to politics we must develop the institutions, citizen capacities, and citizen stakes (discussed later) that will move us beyond disagreement and unexamined belief.

This leads us to the second problem with Smith's reading of the common good in Aristotle. Smith almost entirely neglects the necessary conflict built into politics and the political arrangements that as a result are necessary to develop agreement about collective ends. Consequently, Smith's Aristotle lacks the capacity to rise above unexamined belief. Aristotle constructs all his investigations into human affairs by posing what is conventionally held and then using reason to move beyond belief and convention. Practical reason (phronesis) is about what is open to deliberation (NE 1141b9-13), which is about neither what is known nor belief (NE 1142a32-b16, 1143a1-7), and requires the development of nous (NE 1141a2-8), the faculty of rational intuition about undemonstrable first principles, which for Aristotle connotes being sensible or having common sense (NE 1110a8-11, 1112a19-21, 1115b7-11). Practical reason cannot be taught through traditional schooling; it is developed through selfgovernance in one's household affairs and through participation in political deliberation in institutions arranged so that belief and convention can be challenged (NE 1141b23-1142a30).

Smith's account of developing good citizens looks to the family, education, and to a lesser extent living according to laws. These are certainly critical elements of good politics for Aristotle, but they cannot by themselves deliver it on Aristotle's account. One missing component—participation in deliberative politics not only helps citizens develop the skills to apply the laws well to particular cases but also helps ensure that the laws that habituate us are good laws. It is through deliberation that belief and narrow interest are at least potentially exposed to reasoned examination in a democracy. The common advantage is not something we develop prior to politics; it comes to a significant extent from acting politically.6 By neglecting almost entirely the conflictual nature of politics and the resulting need for constructing good deliberative practices in Aristotle,7 Smith's conception of Aristotelian politics lacks the capacity to rise above convention and belief to attend to what the good might be and how it might be

⁶ Frank (1998, 795) has a similar account of how Arustotle's conception of excellence (areie) in the polis draws on a reflexive contrast between habit (hexis) to "being-at-work" (energeia) and action (praxis).

developed politically. In this regard, it is antithetical to Aristotle's entire political project.

MULTIPLE NEEDS, NECESSITY, AND STAKES

In his discussion of the common good, Smith (1999, 626) introduces us to citizens with the disposition to grasp for more and more. His treatment of individual goods captures the side of Aristotle that warns about the dangers of a lack of moderation but ignores the many positive features Aristotle attaches to the many goods that individuals desire. Smith's partial portrait of humanity misconstrues Aristotle's view of what it means to be human. Aristotle holds that part of our humanity comes from caring about ourselves in the right ways. This does not mean leaving the world but living in it in ways that lead to our happiness. We see some of this in Aristotle's critique of Socrates' views regarding shared property and families for the philosopher kings in the Republic. On Aristotle's account, Socrates takes the natural attachments of human beings to be forces of gravity that pull them to the earth, denying them the chance to become wise and virtuous $(P \, \Pi, \, 1-5).$

Some of what Socrates takes as impediments to human flourishing is what Aristotle finds is a natural aspect of the human condition. Part of our humanity comes from the right kind of tangible attachments because they contribute to our happiness. Aristotle provides an inventory of some of the components of happiness: friendships, good children, economic security, a satisfying old age, health, reputation, and virtue (R I.5.4; also see NE bk. 1). His listing shows that a variety of goods is essential to the good life, which Smith seems to overlook in his effort to focus on the one obstacle that must be overcome if we are to become just. As Salkever (1990, 137-9, 153) shows, attending to these multiple needs in the right way is part of what makes us human. One who fails to attend to her multiple needs is defective in some significant ways. We have needs that revolve around our households, work, friends, politics, and the like, and we cannot, according to Aristotle, understand ourselves apart from each of these needs. The multiple needs of different individuals are distinctive and vary from person to person. Aristotle maintains that when we make one good or need dominate the rest, we undermine our happiness.

For this reason, Smith's common good is far too static for Aristotle, and his call for a "radical conversion" (1999, 628) is too problematic for Aristotle. Aristotle recognizes that the best politics is fluid and negotiable, reflecting the changing conditions of the members of society. He reaches for a cosmic harmony that is always on the horizon; it is an aspiration rather than a solution to impose on everyone. His political cosmos appears in public (i.e., common) space where discrete citizens work out their differences politically. Aristotle's cosmological politics provides a structured space where politics holds the parts together within a whole that is changing. All this disintegrates if one part

⁷ Although Smith acknowledges conflict, it seems to be almost entirely missing from the workings of his version of Aristotelian politics.

imposes its conception of justice and dominates all the other parts.

Aristotle looks at both the whole and the parts. Although he states that the "whole must of necessity be prior to the part" (P 1253a20), he argues that neither stands independently of the other. To degrade the parts is, for Aristotle, to degrade the whole; the whole then can no longer be said to seek what is to the common advantage. For him, it is necessary to consider both the integrity of the polity and the integrity of its many households with all their complexity, and he finds a good politics will challenge the efforts of some to dominate the rest. This is something Smith misses.

Aristotle's political cosmos not only reflects the different needs, ideas, strengths, opportunities, and vulnerabilities that reside in each particular community but also rests on the ability of all citizens to secure their basic needs. To achieve this, Aristotle has his citizens in the good state own their own property, which enables them to attend to the biological needs of their household and not be dependent on others.9 Property figures prominently because of what it does, not as an end in itself. For him, property ownership is an essential characteristic of good citizens who do not have to please others to meet their needs. This material foundation allows citizens to move beyond satisfying basic needs in order to attend to their multiple needs, including politics and the common advantage.10 This stake provides citizens with an interest in living under the laws [nomoi] as well as attending to their making. It is not, as Smith believes, that simply overreaching impedes attending to the common advantage. The inability to attend to one's material needs and security limits a citizen's horizon to self-referenced material concerns just as much as overreaching does.11

There is another reason property ownership is important to Aristotle: It provides citizens with a tangible stake in their republic. He wants them to see not only that their own good depends on their own efforts and perseverance but also that their good is intimately tied to the good of the republic. When this occurs, citizens have a stake in their own property and in their republic as well. For Aristotle, the stakes of citizens must be

more than procedural or cognitive; they must be substantive. 12

Aristotle finds that private property ownership as a citizen stake fosters a connection between the unavoidable concerns people have about themselves and a concern about their republic. They recognize that their ability to meet the multiple needs of their household depends not only on their own labor but also on the protections and security provided by their republic. In Aristotle's good regime, the good of the whole is entangled with the good of each citizen and does not stand in opposition to it when citizens experience the goodness of their republic in their everyday lives. For Aristotle, a stake is not a gift but an essential requirement for full citizenship. To deprive people of their stake is in effect to strip them of their citizenship. For this reason, private property, or whatever assures the political autonomy of each citizen,13 does not stand apart from the political but is related to it. Even if Smith is correct about teaching people not to overgrasp, such a strategy cannot work if citizens are without economic security and therefore lack a stake in their republic.

FRIENDSHIP AND POLITICS

Like his account of the common good and overreaching, Smith's account of the relationship of politics and friendship gives an incomplete and problematic reading of Aristotle's more complex view on friendship. Smith focuses on what friends have and think in common, to the neglect of a more political side of friendship in Aristotle's view. By collapsing the distinctions between true (or moral) friendship and political friendship, Smith develops a reading of Aristotelian friendship that informs his Aristotelian politics by drawing almost entirely from the Nicomachean Ethics to the exclusion of the Politics. This leads to serious problems with how to develop friendship and concord (homonoia) in the regime.

Smith (1999, 629–31) focuses almost completely on the "being of the same mind" aspects of Aristotelian friendship to the exclusion of a more political conception of true friendship and concord. True friends deliberate on the good life and correct each other's errors of reasoning (NE 1172a10–4). As we know from Aristotle's discussion of the intellectual virtues, we deliberate over that which can be otherwise (NE 1140a31–b12) rather than over beliefs we already share (NE 1142a31–b35). True friendship is like politics: We both share and disagree, and we deliberate over our disagreements with the aim of improving ourselves and

m trade or farming" (P 1320a33-40).

⁸ Salkever (1990, 51) finds that Aristotle's universe is "composed of interdependent parts which are themselves wholes" When one part seeks to disturb the harmony of the whole and uses its power to serve its interests, it destroys any conception of common advantage and denies the other parts their integrity.

⁹ For Aristotle, a citizen cannot be someone who is used by another for the latter's purposes, which defines a slave (see P 1253b33-5).
¹⁰ This is why Aristotle wants to eliminate destitution. We "should see to it that the multitude is not overly poor; for this is the reason for democracy being depraved. Measures must therefore be devised so that there will be abundance over time. Since this is advantageous also for the well off, what ought to be done is to accumulate what is left over of the revenues and distribute accumulated [sums] to the poor. This should particularly be done if one could accumulate enough for the acquisition of a plot of land, or failing this, for a start

¹¹ In this light, Pocock (1975, 203) finds that Aristotle's citizen has a "household of his own to govern so that he may not be another man's servant, so that he may be capable of attaining good in his own person, and so that he may apprehend the relation between his own good and that of the polis."

¹² For an extended discussion of stakes in Aristotle, see Terchek 1997, chap. 2; for a general discussion of stakes in contemporary society, see Ackerman and Alstott 1999.

¹⁵ We use "autonomy" in a very specific and limited way. Aristotle's good citizens are interdependent and simultaneously not dependent on (and therefore beholden to) another for their economic security. In this way, his politically autonomous citizens bring their own voice when they deliberate and participate in the regime. We do not intend for the term to carry the individualist baggage that most modern uses connote.

our relationship. Aristotle tells us that because we are political by nature we have a need for friendship (NE 1169b18-22), which implies that we have an ingrained need to deliberate on the good life, the pleasant and unpleasant, the advantageous and the harmful. If we only agreed, friendships would remain incomplete. As an external good, true friendship is pursued for its own sake and should not be reduced to a means to the common good, as Smith does. As political animals, we need to engage in politics and friendship (i.e., figuring out how to live well together despite our differences) to be fully human.

This said, we must not carry the analogy between true friendship and politics as far as Smith does. Whereas Smith wants to make political friendship into true (or moral) friendship, Aristotle wants to draw sharp distinctions between the two: "Certainly it is possible to be friend of many in a fellow-citizen's way, and still to be a truly decent person, not ingratiating; but it is impossible to be many people's friend for their virtue and for themselves. We have reason to be satisfied if we can find even a few such friends" (NE 1171a18-20). If true friendship is impossible other than among very small groups, then what kind of friendship is political friendship? Aristotle clearly considers it to be a matter of utility rather than a true friendship. "[Political] friendship... is constituted in the fullest degree on the principle of utility, for it seems to be the individual's lack of self-sufficiency that makes these unions permanent" (EE 1242a6-7).14 Political friendship, then, "looks to equality and to the object, as buyers and sellers do" (EE 1242b33).

This conception of political friendship stands in sharp contrast to the harmonious, other-regarding citizen-friends that Smith develops, but it is not incompatible with Aristotle's conception of homonoia among citizens, from which Smith builds his case. In the Nicomachean Ethics, Aristotle states: "Concord [homonoia], then, is apparently political friendship, as it is said to be; for it is concerned with advantage and with what affects life [as a whole]" (NE 1167b2-4). Because it is concerned with advantage, it is a friendship of utility. Aristotle goes on to tell us that homonoia agreeing about what is advantageous (NE 1167a24-8) and having "the same thing in mind for the same person" (NE 1167a35). This does not mean that citizens lose their self-regarding interests, however. As we see in the discussion in the Politics, the few and the many come to agreement through deliberation, a process in which both sides must address the concerns of those with whom they are in conflict in order to reach a compromise that is mutually advantageous to a majority forged from the ranks of both factions (P 1291b29-1292a37). On this account, homonoia is a political negotiation of interests that is supported by institutional arrangements rather than by a moral agreement or the harmonization of interests.¹⁵

By substituting true for political friendship, Smith overemphasizes the harmonious, moral nature of political friendship and misses the complex dynamics of Aristotle's conception. Contrary to Smith's view, Yack (1993, 35) rightly points out that friendship (philia) for Aristotle is a generic term describing "a much broader range of relationships than we are accustomed to using the word 'friendship' to describe." Instead, it describes "all expressions of human sympathy and mutual concern" (p. 35) and is akin to "friendly relations" that we have "with a much larger and broader range of individuals than those with whom we have the intimate and noninstrumental ties that we ordinarily associate with friendship" (p. 35 n. 29). Political friendships, being friendships of utility among equals, are analogous to business relations in which we have "friendly feelings" toward the partner in a mutually beneficial exchange as well as a sense of holding each other to an obligation of receiving "what is due" (EE 1242a6-13).

For Aristotle, political friendship presents the possibility of bitter conflict,16 and because of this there is also the seemingly paradoxical possibility of developing bonds with both our fellow citizens and the institutions of our political community. Because factional conflict arises from small disputes (P 1303b17), it is in political friendship itself that we find the very seeds (in the hurt and recrimination of betrayal) that can grow into intense conflict and the collapse of the regime. In these conflicts among citizens, however, there are also the seeds of civil bonds and the nurturance of political friendship itself. As we seek to enlist the aid of our fellow citizens to enforce the justice we feel is due us,17 we engage in the activity of deliberating over what justice is, which in turn develops practical reason (NE 1141b23-1142a30) and the virtue of justice in the citizenry.

Smith's (1999, 629-31) characterization of political friendship as true or moral friendship—we think good thoughts about one another and rely on moral character—is according to Aristotle one of the most dangerous beliefs we can bring into the political community. In a passing remark, Smith (p. 631) acknowledges the danger. Yet, given that the rest of his discussion of friendship is entirely contrary to that acknowledgment, we must conclude that he depicts a very un-Aristotelian place. Aristotle seems to be speaking directly to Smith, when he warns:

When, therefore, [political friendship] is based on a definite agreement, this is [political] and legal friendship; but when they trust each other for repayment, it tends to be moral friendship, that of comrades. Hence this is the kind of friendship in which recriminations most occur, the reason being that it is contrary to nature; for friendship

¹⁴ Rackham (Aristotle 1992, 415–7) uses the term "civic friendship." We substitute "political" to keep it consistent with the rest of our discussion. Aristotle uses *politike* to describe this friendship (*EE* 1242a1–9).

¹⁵ We all may agree to submit to the decision because we recognize the process as being fair, that is, there are no consistent winners and losers, and all have a fair chance of entering the deliberation and swaying others to their cause.

¹⁶ Friendships of utility, as political friendships are, are by their nature prone to complaints and disputes (NE 1162b5-21).

¹⁷ See Yack 1993, 42, for a more thorough discussion.

based on utility and friendship based on goodness are different, but these people wish to have it both ways at once—they associate together for the sake of utility but make it out to be a moral friendship as between good men, and so represent it as not merely legal, pretending that it is a matter of trust (EE 1242b35–1243a2).¹⁸

Aristotle's discussions always point out that the greater the feeling of intimacy between partners, the greater is the potential for recriminations. For political community to be stable, which Aristotle frequently raises as a basis for good politics, it is imperative that relations among citizens be based on institutional and legal arrangements rather than on presumptions of another's morality and upon an intimacy that does not exist among citizens qua citizens.

This is not to say that Smith's concern with improving the quality of political friendships is not both laudable and in line with the spirit of Aristotle's thinking; it is dangerous not to attend to the conditions of the political friendliness of citizens. Inequality breeds recriminations in any friendship (NE 1161a30b10, 1163a24-35), just as does confusing political friendship with true friendship. Providing a solid material foundation for citizens may reduce accusations, since "most men pursue what is fine only when they have a good margin in hand" (EE 1243a37). Finally, it is clear from Aristotle's critique of politics as usual in Book VII of the *Politics* that he wants to move away from citizens bashing other citizens and seeking honor to a deliberative politics that better approximates the deliberations between friends. Although Aristotle finds education important,19 his focus is on institutional arrangements in the republic, such as those mentioned above and in our discussion of common advantage.

LIBERALISM, ARISTOTLE, AND SMITH

Smith (1999, 625) offers his account of Aristotle's common good as an alternative to liberalism. He makes the not uncommon assumption that liberalism is a unified theory, but as Gray (1989) has cogently shown, not all liberals are of the same stripe. Ironically, Smith's conception of the common good features a strand of liberalism that emphasizes moral individualism, 20 something alien to Aristotle's political thinking.

Most recent scholarship on the canonical texts of pretwentieth-century liberalism emphasizes a moral content to this literature.²¹ It finds that the very freedom canonical liberals prize not only is necessary for a fully flourishing life but also can lead to the opposite. Free men and women can mistake their liberty to mean they should pursue anything they wish.

To counteract this prospect, liberals such as Locke want individuals to surmount their passions in ways that will lead to their moral development, as Locke discusses in *Thoughts Concerning Education* (1968) and *The Reasonableness of Christianity* (1823). What is arresting in these accounts is how little attention is devoted to the material or economic conditions of individuals. Rather, Locke makes individuals morally responsible for their choices and their character. To assist them in this moral quest, Locke and many liberals for some time afterward turn to religion learned in a church one freely chooses or to a moral education.

In Smith's "reorientation" (1999, 628) and the moral individualism of Locke, the focus is on how people cultivate virtue and thus change themselves. The latter wants us to deny ourselves (Locke 1968, par. 33), and the former wants us to forgo grasping. In each case, the effort concentrates on individual dispositions. With Locke and Smith, we move away from Aristotle's concerns about politics and the multiple needs and stakes of citizens, and little attention is paid to institutional arrangements. Locke's moral individualism is unconcerned about the economic security or well-being of citizens, and it turns out that Smith does not vary much from this version of liberalism.²²

Contrary to Aristotle but similar to liberals such as Locke, Smith ignores the social constructedness of individual identity and interests. The focus of Smith's attention is abstract individuals: how they overgrasp and how they need to reorient themselves.²³ With Smith as well as with Lockean liberals, there is no concern that citizens have stakes in their republic. For his part, Aristotle takes account of the social and political aspects of persons and focuses on their institutional arrangements, which is missing in Smith.

We are also troubled by Smith's discussion of liberalism. Although Smith (1999, 625) sees some problems in communitarians, most of the problems he finds in modern life are tied to liberalism, with its penchant for neutrality and individual ends. His argument simplifies matters too much by ignoring not only Aristotle's view of the complexity of politics but also the many ways that the common advantage can be subverted. In order to meet the challenges that face us, we need more than a one-dimensional explanation that hides too much to be helpful.

CONCLUSION

Smith's account of Aristotle is a political minimalism that overlooks the themes of power, conflict,²⁴ and

¹⁸ See note 4.

¹⁹ Although Smith concentrates heavily on education, his focus is not on improving the quality of deliberation, such as is found in *Rhetoric*. In Aristotelian politics, a knowledge of ethics and rhetoric as well as the educatory practice of participation in deliberative politics are all important to the development of good deliberations and judges of deliberative arguments.

²⁰ See Terchek 1997, chap. 4, on Locke as a moral individualist ²¹ For some works showing the moral content in major writers in the liberal cannon, see Dunn 1969 and Colman 1983 on Locke; Raphael 1985 on Smith; and Semmel 1984 and Ryan 1974 on Mill.

²² Smith (1999, 630) holds that "Aristotle's is an ethics of being not having." This makes Aristotle into something he is not. Being, as in being virtuous and philosophical, is obviously central to Aristotle, but he also thinks that being happy is essential, and Aristotle's happy person also possesses certain things.

²³ As pointed out earlier, this contradicts Aristotle, who clearly states that "most men pursue what is fine only when they have a good margin in hand" (EE 1243a37).

²⁴ For Aristotle, conflict is a necessary and unavoidable part of the good regime because people are different. He sees two critical

possible reconciliation that are at the heart of Aristotle's politics. Whatever else may be said about Aristotle, he does not want people to pretend that power is irrelevant in politics or that ethics can stand in the place of politics.

Contemporary political discourse often takes on a minimalist dimension, and we are often told that to make things better, citizens must change their outlook, regardless of who they are and what they have. Political minimalism seeks to settle individually problems that once were considered collective, or it ignores them. It also largely ignores power and the inequalities that reside in any society. This political minimalism animates Smith's account of Aristotle's "common good," a rendition that relies on ethics, not politics, and that avoids the hard stuff of political disagreement in favor of making friendship the foundation for civic thinking. However admirable such dispositions appear on the surface, they ignore the potential danger that Aristotle sees in any kind of political arrangement, namely, that some will attempt to use public power for their private advantage. To counter it, Aristotle teaches us to be attentive to politics and to the constitutional arrangements that assure the political presence of all citizens, not just a few. He also reminds us that citizens do not stand apart from their multiple needs and require material stakes to tie their good to the good of the republic.

Smith presents a story that is only minimally concerned with power and politics and how the troubles that pursue us can be largely solved by thinking the right thoughts. Whatever else such a line of reasoning may be, it is not that of Aristotle, who in the *Politics* shows a persistent attentiveness to a world of inequality and power and who asks how individuals can learn to share a time and place in ways that respect the integrity of each and that enable moral flourishing. At the heart of Aristotle's politics is a quest to protect the integrity and political autonomy of each citizen in a political

political issues: how to keep the conflict within a constitutional framework and how people live well together as citizens despite conflict.

cosmos that can also challenge the centrifugal forces inherent in any society.

Ethics and Politics: A Response to Terchek and Moore

THOMAS W. SMITH Villanova University

respond to Terchek and Moore by investigating the interrelationship of ethics to politics in Aristotle's thought. To this end I defend two claims. First, doing ethics requires understanding politics. Second, politics requires practical wisdom and ethics. Since even the politics wanted by Terchek and Moore requires these virtues, they are wrong to claim that my account of the common good, resting as it does on similar virtues, is impractical and dangerous.

thank Terchek and Moore for their interesting and thought-provoking response.¹ In one way, they raise issues important to the growing debate over the meaning of Aristotle's political thought. In another their criticisms recall those in Aristotle's time who faulted the classical political philosophers for their apparent inability to comprehend the "real world" of power (NE 1095a25, 1141b4-10; Plato's Crito 44b-d; Gorgias 483d-e, 485a-d; Republic 336aff).²

In general, their presentation of my work suffers from an interpretive mistake common to many contemporary Aristotelians. Terchek and Moore read me as many interpreters read Aristotle: as a didactic theorist interested in promulgating abstract political and moral doctrines to an indeterminate audience.3 But this approach overlooks any pedagogical or zetetic concerns and thus conflates exploration and advocacy. My critics assume that in pointing out the conditions for the common good I am advocating policies to advance it, which allows them to neglect or distort my argument that the conditions for the common good point to its limits. Because they overestimate my estimation of the possibility of the common good, they underestimate my assessment of the reality of narrow self-interest in political life and the limits this imposes on reform (Smith 1999, 634). Thus, they miss my argument that sketching the conditions of the common good can be read either as an injunction to pursue it or a warning not to, depending on circumstances (p. 634).

DISTINGUISHING ETHICS AND POLITICS

Underlying the various criticisms of Terchek and Moore is the general claim that I have run together ethics and politics. The problem is that they never articulate a distinction themselves. They merely claim ethics and politics are distinct without telling us how. Related to this is their failure to refer to a slew of

excellent research devoted to a careful parsing of the distinction they casually assert.4

A brief reconstruction of their implicit account goes as follows. Ethics concerns individuals acting morally. Politics concerns the relationships among people who have irreconcilable needs and interests and who therefore come into conflict. Thus, politics is about the ways citizens struggle to protect their interests through legal and institutional frameworks (Terchek and Moore 2000, 905, 906–7, 909). Politics is primarily instrumental and should be hesitant in making substantive claims about the good life, since all such claims are contested and contestable (p. 906). This is not how Aristotle thinks about the relationship between ethics and politics. His view is more complex, and I will sketch it by defending two claims: Doing ethics requires understanding politics, and political wisdom requires ethics.

DOING ETHICS REQUIRES UNDERSTANDING POLITICS

Contrary to the bifurcation of ethics and politics by Terchek and Moore, Aristotle characterizes his inquiry in the *Nicomachean Ethics* as an investigation of politics (1094a30-b12). How is an investigation into ethics an account of politics? Aristotle writes his ethics to help people do what is good (*NE* 1094b11, 1103b26-30, 1179b1-4; cf. 1194a22-3). A problem immediately intrudes, however. Aristotle thinks that every context is formative. If his goal is to help us do what is good for us, he must somehow deal with the fact that our minds are already made up on this score. That is, doing ethics entails realizing that our regime forms us comprehensively; it affects our tastes, habits, sense of justice, and whom and what we respect and emulate. Terchek and

Thomas W. Smith is Assistant Professor of Political Science and Acting Director, Core Humanities Program, Villanova University, Villanova, PA 19063 (thomas w.smith@villanova.edu).

¹ I appreciate the valuable suggestions of V. Bradley Lewis, Walter J. Thompson, and Kevin L. Hughes.

² Aristotle responded to these critics partly by wondering why they did not have power, since they claimed to understand it so well (NE 1180b31-1181a3). I will refer to Aristotle's works within the body of the text according to the following scheme: Nicomachean Ethics (NE); Politics (P). Translations are my own. All references to Plato can be found in Plato 1961.

⁵ For an account of these approaches and an attempt at correction, see Smith 1993

⁴ There are several dimensions to the problem of the relationship between ethics and politics in Aristotle's thought. One is textual. Aristotle presents the last chapter of the Nicomachean Ethics (NE X.9) as a prologue to a discussion of politics, but in several ways this prologue does not seem to correspond to the structure of the Politics as we have it (see Lord 1981; Rowe 1991; VanderWaerdt 1984). Another dimension is the relationship of ethics to politics in Aristotle's thought generally. Perhaps partly because of the textual difflculties, many scholars read Aristotle's ethical works as autonomous moral tracts intended to be considered apart from his political writings. See, for instance, Gauthier and Jolif 1959, ii.1-2; 10-2; Nussbaum 1986, 237, Voegelin 1957, 279 Others argue for various reasons that Aristotle's ethical thought is inseparable from his political thought (Adkins 1991; Bodéus 1993; Rowe 1991; Simpson 1998; VanderWaerdt 1984). I have addressed both the substantive and textual problems (Smith 1998).

⁵ I make a similar argument elsewhere (Smith n.d., chap. 1).

Moore fault me for failing to understand Aristotle's political thought, but they fail to see that Aristotle treats political things not abstractly or universally but always with reference to specific regimes. To him, a regime is not merely an arrangement of political offices or a formal legal order, as my critics assert. It includes offices (P III.6, e.g.), and understanding law is crucial for understanding regime, but Aristotle emphasizes that these structures serve to foster or promote the end of the political organization and the society as a whole; they seek to inculcate a way of life (Strauss 1953, 136–7).

For Aristotle, this way of life is a matter of affection. Terchek and Moore argue that by basing politics on affection (philia) rather than considerations of power, I inject a dangerous moralistic element into politics.⁶ Yet, this claim rests on a deficient understanding of Aristotle's treatment of friendship. They "dispute" that Aristotle examines philia analogously (Terchek and Moore 2000, 905), despite the fact that the Greek term analogia recurs in his treatment (NE 1158a35, 1162a15, 1163b32), and their subsequent analysis shows they do not understand analogy or its importance for Aristotle's account of human communities. This makes their account excessively moralistic because it implies that "morality" cannot be in our interest.

Terchek and Moore's reading of philia is typical of those who view Aristotle's political philosophy through Kant's notion of morality as an autonomous realm of conduct unconnected to beauty, nature, or self-interest (MacIntyre 1984, 43-7).7 This approach implies a "sharp" distinction between "true" or "moral" friendship, on the one hand, and "useful" friendship, on the other (Terchek and Moore 2000, 908), but this distinction is foreign to Aristotle's treatment of philia; he does not bifurcate morality and utility. For instance, he thinks that healthy useful relationships are in truth kinds of friendship. Furthermore, the best kinds of friends find each other extraordinarily useful in a variety of ways (NE IX.9; 1172a12-5). Analogous terms resist sharp distinctions because they resist both definition and the application of a single account that does not vary from one context to another, yet still demand employment in diverse contexts in spite of acknowledged differences in meaning (Burrell 1973, 26). In

short, analogical language is necessary for realities that are both different and alike. Terchek and Moore are right to say that for Aristotle political friendship is different from other kinds of friendship, but they are wrong to overlook their similarities. Contrary to their reading, the principle of distinction among the kinds of philia is not whether morality is present, and thus whether the friendship is somehow "true," but what kind of affection or love animates the philia in question (NE 1155a33ff). That is, for Aristotle the real question to ask when distinguishing different kinds of relationship is: What kind of love binds it together?

Aristotle thinks that political regimes are more than instrumental arrangements of laws and institutions (P III.9.1280b5-12, 1280a31-4, to take but a few examples) because they cultivate more or less determinate ways of life to which the citizenry is dearly attached. In his view, when a regime arranges its offices; passes laws against running away in battle, public drunkenness, swindling, or discriminatory housing policies; or issues tax breaks to encourage certain economic or religious activities, it is making broad claims about what kind of life is good for citizens of that regime. One way of getting at the affection that binds citizens to their regimes is to ask for a list of what they would be willing to die for. This would typically include family, friends, and what the French call patrie, which encompasses one's territory, political structures, history, and way of life generally. These are clearly useful relations: The land gives life; political arrangements protect and govern; fellow citizens make social life possible. But our political relationships are both useful and matters of intense affection. To argue that people should love their homeland instrumentally is to ignore their deep and abiding affection for it, which is based on more than a rationally calculated assessment of the worth of legal and constitutional arrangements meant to protect them from power.

Philia is an analogous term because people typically say they love their families, friends, and regimes, even though they mean different things in each case. Aristotle is realistic enough to know that the question for most citizens is not: "Should we love our regime?" Because affection is already present, the real questions are: "How should we love it? Do the affections animating a particular polity tend to make its citizens flourish or not?" Terchek and Moore are correct to point out that it is dangerous to run together political and filial affection, but they go on to argue that because affection is dangerous, we should avoid it in politics. Yet, if

⁶ Terchek and Moore (2000, 909-10) rely on a passage from Eudemian Ethics to argue that Aristotle thinks it dangerous to rely on "moral character" in politics. Yet, they completely misread it. In that text Aristotle differentiates the relations between citizens and business partners. His warning does not concern the relationships among citizens, which aim at equality and are protected by law. Instead, he warns business associates not to mistake their partnership for a relationship of trust unbound by legal rules. In these relationships, there is no legal protection, and recrimmations are rife. A careful reading of the passage shows it is not about politics at all. Rather, Aristotle is urging us to protect our commercial dealings with legal arrangements (EE 1243a5-7; cf. the corresponding passage at NE 1162b26).

⁷ For example, according to Terchek and Moore (2000, 910, n. 22): "Being, as in being virtuous and philosophical, is obviously central to Aristotle, but he also thinks that being happy is essential." This bifurcation of happiness and virtue is utterly unAristotelian because, for Aristotle, happiness is virtuous activity (NE 1098b31-1099a7, 1098a16, 1101a14, 1177a12-b26).

Strangely, despite the criticism that injecting affection into politics is dangerous (Terchek and Moore 2000, 909), elsewhere Terchek (1997, 48) acknowledges that people typically love their political communities: "Patriotic citizens have a normative or ideological investment in the vitality of their republic. They take it to be good and reach this conclusion on the basis of their civic education as well as from their experiences in society." They "value" their republic for a variety of civic and private reasons.

⁹ I make this point explicitly (Smith 1999, 631), and my critics acknowledge this (Terchek and Moore 2000, 909). Yet they dismiss my caveat, saying that it is "entirely contrary" to the rest of my analysis (p 909). An interpretive approach that dismisses an author's explicit claim is uncharitable and makes rational conversation diffi-

the authors are right that any intense affection in a useful relationship is so dangerous that it should be avoided, we then ought to ban marriage and familial childrearing as well (cf. Plato's *Republic* 457d, 460c).

Aristotle insists that politics is architectonic, for regimes affect every aspect of human life, including our individual formation (NE 1141b21, 1141b24-8; P 1252a1-8, 1260a17-9). The regime manages the overall shape and direction of the constituent parts of the political community because its citizens are always acting on some conception of what is good when they pass laws or engage in typically respectable practices. For example, politics determines the kinds of science practiced, the kinds of arts permitted and encouraged, what sort of education citizens receive, which social activities will be forbidden and which fostered, what sorts of goods can and cannot be sold, what counts as a marriage, and so on (NE 1093a27-1094b12).

The problem is that regimes deform more or less. Most regimes are defective because the ruling element in each foists its own interests on everyone else and calls this "justice" (e.g., P 1301a37-40 and generally V.1, III.9, III.12). Aristotle thinks that all regimes skew their politics to the interests of the ruling element rather than the interests of the whole or the common good, so all existing regimes are more or less unjust (P 1252a7-9, 1324b32-3). It follows that he believes most human beings are not virtuous (NE 1150a15-16) precisely because they are formed by the habits, customs, and laws of regimes that are more or less defective (NE 1796b16-20). Indeed, the situation is worse than it initially appears: All regimes necessarily form us, but most do not reflect on the problem as such.

Aristotle says that only in Sparta and a few other cities has the legislator thought about formation (NE 1180a24-9). His famous criticisms of Sparta (P II.9) force us to realize that, in the only places where citizens reflect on the issue, he thinks it is done so badly. Yet, although the formation our regimes give us is by and large defective, it is also necessary. Nature has underdetermined us. More than any other animal, human beings desire things as a result of habituation and reflection, rather than simply as a result of inherited biological factors or instincts. The actualization of these uniquely human qualities, however, requires socialization (NE 1180a4-5; Salkever 1991, 12). Thus, we require an education we cannot supply.

Some prominent interpreters argue that the *Nicomachean Ethics* has a political dimension because it provides a kind of basic training for politicians (Bodéüs 1993, 123; VanderWaerdt 1985, 77–89), but that is only part of the story. Aristotle thinks that any attempt to inquire into ethics must take into account the way one's character has been formed by one's regime. His pedagogy has a political dimension because the effort to make people good is inseparable from a resistance to their deformation. The *Ethics* is a semipublic act of countervailing persuasion aimed at reforming personal

and social life through the reorientation of the souls of Aristotle's students.

Aristotle argues that this countervailing resistance requires learning about politics. Right after his sobering discussion of the ways regimes and the households within them fail to form rightly, he states: "Our next task is to consider from what source (pothen) and how (pos) we can become practitioners of the lawmaking art (nomothetikos)" (NE 1180b28-9). Due to widespread misunderstanding, it is crucial to be clear about this passage. The traditional account glides over the distinction between learning about law and learning where and how to learn the lawmaking art. Consequently, most scholars assume that Aristotle in this passage means that he is going to speak about what legislation is in the *Politics* (Lord 1981; Rowe 1991, 70-2). This passage baffles many interpreters because it seems to promise a discussion of legislation that never appears in the Politics. Yet, Aristotle never says he will discuss legislation in the Politics. Rather, his task is to inquire where and how to learn about it. Why?

The point of the *Politics* is not merely to learn how to enact laws, as Terchek and Moore argue (2000, see e.g., 905, 910). Rather, Aristotle says we should study these questions so that "each one will be better capable of attaining virtue and leading loved ones to virtue" (NE 1180a33-4). This is a reiteration of his earlier point that one who wishes "to make people better through his care, whether many or few, must attempt to become expert in the lawmaking art" (NE 1180b23, emphasis added). Unlike Terchek and Moore, I believe we cannot read these passages as a recommendation to know the art of lawmaking so that "reasonable people," upon grabbing the reins of power, can "protect people's interests" through law. Aristotle believes that human beings tend to be unreflective about the ways they have been deformed. Most of us tend to selfrighteousness by overestimating our own capacity for virtue. Yet, if most of us are deformed more or less by defective regimes, our first task would be to be on guard, lest we identify our own narrow interests with something like the common advantage.

Contrary to Terchek and Moore (2000, 908–10), I do not think that grabbing power and balancing interests through law is sufficient. The problem is that most people have a skewed understanding of their interest, and this makes political reform very difficult. From an Aristotelian perspective, any political reform runs the risk of mistaking one's own interest with the interest of society. Moreover, even if the reformers are correct, the defective formation of the larger regime entails that they cannot hope their decrees can resolve the fact that many will not see the sense in reforming policies.¹⁰

The main reason for learning the art of lawmaking is to become more reflective about how the regime's laws deform us in order to help ourselves and our loved ones resist that deformation more successfully. Only by achieving a sense of the ways we have been deformed by our surrounding culture can we achieve some mea-

cult, since in principle any claim can be reinterpreted according to the interpreter's whim.

¹⁰ I make this point in Smith 1999, 631, 634, n. 14.

sure of thoughtfulness and genuine direction of our lives and the lives of those we love. That is, since politics forms us decisively, knowledge of politics is necessary to bring people a bit closer to more genuine human excellence (P 1259b18-9). This process has strict limits because any community within a regime is not self-sufficient. We cannot hope to withdraw from political life because our households and friendships rely on larger structures for resources and protection. For Aristotle, our task is to become more thoughtful about our regime's assumptions and how they affect our lives so that in very practical, local ways we can do something about them. Understood in this way, for an Aristotelian there is a political dimension to most of our daily undertakings, from rearing our children to engaging in friendship, religion, or economic life.

In my article I articulated a motive for this care in formation by sketching an example of a common good in the family.¹¹ This motive flows from our interdependence. In the family, we depend on our loved ones' differences for life, sustenance, and socialization. Analogously, in politics, we depend on our fellow citizens to participate in civic life reasonably, socialize us and our children, defend us in battle, pay their taxes, obey the laws, help us in hurricanes or earthquakes, and so on. Because we also divide up tasks in political communities, we depend on differences in this as well. The fact that we depend on fellow citizens means that we have a motive to be responsible with and to them. By mistaking my account of motive for an account of habituation, Terchek and Moore overlook the issues I raise. Differences within families can lead to conflict. but they also can be opportunities for loving cooperation. In politics, differences can be an occasion for conflict and might require balancing competing claims and interests (P III.13). But can diversity lead to a convivial interdependence in which citizens set aside distrust and competition for mutual benefit? Indeed, might a common good precisely depend on our diversity and interdependence insofar as homogeneity renders us less useful to one another?12

Politics differs from other architectonic practices. Bricklayers need not know anything comprehensive

about architecture to do their job; in this case, knowledge of the part does not necessitate knowledge of the whole. In contrast, the formative dimension of political regimes entails that knowledge of the part necessitates knowledge of the whole. Our roles as mothers, fathers, friends, accountants, lawyers, members of religious communities, or participants in an economy are so decisively affected by our larger regime and the way of life it fosters that in order to do these tasks well, we need to know a great deal about our politics. For Aristotle, genuine knowledge of how to form ourselves and our loved ones requires comprehensive knowledge of politics, because the regime is the overarching context that decisively affects each of its parts. In this way, ethics is not separable from politics in the way Terchek and Moore imply.

PRACTICAL WISDOM REQUIRES ETHICS

I have shown that doing ethics requires knowing politics. Yet, are Terchek and Moore correct to point out that the Politics is all about institutional arrangements and balancing competing diverse interests rather than getting people to be good? Ironically, given their criticism of my work, their account is abstract and apolitical. Above all, they miss the way Aristotle analyzes legal and institutional arrangements in the Politics. Again, he examines these with reference to particular regimes. Contrary to Terchek and Moore's interpretation, the *Politics* is not about legal or institutional arrangements abstracted from any and all circumstance; it is about the politics of different kinds of regimes, and the ways different regimes make claims about the good life through the practices they encourage and forbid. It follows that any arrangement of offices or legal structures must pay attention to the unique circumstances of the regime for which they are intended. Laws and offices that are perfectly reasonable in South Africa might be disastrous in Peru and vice versa.

Contrary to what Terchek and Moore assert, my account is consistent with Aristotle's account in the *Politics* of the causes of civil strife (*stasis*) and the ways to overcome it in particular regimes. Aristotle says that civil strife occurs because all regimes are only more or less just (*P*1301a27; cf. Smith 1999, 626). Factional conflict "everywhere" is the result of some perceived slight, when a citizen feels s/he is not being treated fairly. These disaffected citizens overreach for an excess of profit or honor when they feel that their regime has not given them their fair share (*P* V.2; cf. Smith 1999, 626-7).

Terchek and Moore argue that I read Aristotle's political thought through the *Ethics* and so miss his advice in the *Politics*, which does not focus on virtue but on political arrangements. What does Aristotle recommend in the *Politics* in order to avoid civil strife? He provides different recommendations for each regime he discusses, but all have one theme in common: Since the cause of civil strife is injustice, the best way to avoid it is to moderate the regime in the direction of

¹¹ Terchek and Moore misread this account of motive as an account of habituation, which leads them to claim that my argument is individualistic. Yet, I provided no account of habituation. In fact, they ignore the only statement I made about habituation, perhaps because it flatly contradicts their claim that I construct an individualistic account limited to the family: "In contrast to those who extol family values" in our time, Aristotelians would insist... that good households are a necessary but not sufficient condition for the proper formation of human beings" (Smith 1999, 631).

formation of human beings" (Smith 1999, 631).

12 Terchek and Moore (2000, 905, 907-8, 910, 911) are wrong to say that I favor a "static" "homogenized good" to be imposed "from the top down." Shareable goods pursued in common, such as friendship, are not static. Indeed, I claim these goods are satisfying because they result from and are productive of shared dynamic action (Smith 1999, 629-30). Furthermore, I consistently argue that the common good flows from interdependence and thus requires human diversity and heterogeneous communities (pp. 631-2, 655). I point out that Aristotelians insist on a "variety of good households" (p. 631) as well as a "variety of common goods," depending on political circumstances (p. 633). Finally, I say explicitly that the common good cannot be imposed from above (p. 634).

justice. 13. For example, he tells both democracies that tyrannize over the minority and oligarchies that tyrannize over the majority to moderate their rule in the direction of justice by mixing their deficient regimes together. He tells tyrants to moderate their rules in the direction of stewardship, for by caring for their subjects justly they can make their reign more stable (P V.12). In every case, regimes are made more stable by drawing them more toward moderation (P 1313a18-9). Terchek and Moore say the focus of the *Politics* is on laws and institutions, not virtue. But Aristotle's point in the Politics is that knowing how to arrange laws and institutions for stability precisely requires virtue. Even a politics that aims at the common advantage for the sake of security and stability requires striving for the virtue of justice. He thinks that the commonwealth can only flourish when citizens actively care for it, and he gives people a motive to do so: Their regimes will be more harmonious and stable if they do.

It follows that Aristotelian citizens have a twofold task. First, they must have "affection toward the established regime" (P 1309a33) so that they can preserve it. Second, to preserve their regime, they must have the critical capacity to know when and how to moderate it in the direction of justice (VanderWaerdt 1984, 244ff). Just as the virtue of an individual in a household demands a countervailing attitude, so the virtue of Aristotelian citizens demands it so they can bend the regime toward justice. Leven the kind of stable politics Terchek and Moore want cannot be had apart from practical wisdom's evaluative-critical dimensions.

Finally, politics requires ethics because practical wisdom cannot be had apart from virtue. On Aristotle's account of action, human beings are always motivated by some object or action experienced as good (NE 1094a1-3; P 1252a1-6). In this sense, the beginning (arche) of action (in the sense of its originating motive) is the end or purpose (telos) of the action. For Aristotle, the disposition of our characters influences the way we perceive actions and goods. For this reason, he argues, vice destroys the initiating principle or motive of right action (NE 1140b15-20) because it truncates our experience and so our perception; a vicious person has not tasted the attractiveness of certain goods and so does not see them as choiceworthy. Stable politics requires both practical wisdom and ethical character. 15

CONCLUSION

The passionate response by Terchek and Moore stems in part from their healthy skepticism about abstract virtue-talk. In particular times and places we may know what a good family is, or a good home economy, neighbor, or friend. And we may know what habits and activities are required to sustain these. But what is virtue in the abstract? For an Aristotelian, virtues are understood with reference to the specific practices and communities they sustain. Otherwise, they are complicated forms of moralistic self-hating propagated by holy rollers afraid of the communal sky falling. Elsewhere Terchek (1997, 7, 48-55) argues forcefully that those who promote self-denying republican conceptions of virtue do not pay adequate attention to the ways ordinary citizens live; ordinary citizens both care about their regimes and are self-interested individuals who need stability and property. My critics believe my account is apolitical because I have not taken this into account.16 They go on to argue that in my enthusiasm for virtue I overlook the legal and institutional structures necessary for a stable common advantage.

Their critique misses the fact that even the politics desired by Terchek and Moore requires virtue, so it overlooks at once our need for practical wisdom, its difficult requirements, and why it is in our interest. Let us assume for the moment that Terchek and Moore are correct to insist that a common good is impossible because it requires individuals to be good, and agreement on the good is impossible in politics because of irreconcilable multiple needs and desires. Let us limit our discussion of politics to what they call the common advantage, which is a politics structured around legal and institutional frameworks. This common advantage is a human problem, and it requires a human solution; particular men and women have to foster it politically. Yet, how are the people involved in politics supposed to know what institutions and legal structures are appropriate for their particular time and place? Knowing how to acquire power is not the same as knowing how to use it well. Politicians require practical wisdom even in order to know how to use their authority to

¹³ For reasons of space I will limit my examples to two recommendations. It should be noted that even when Aristotle does not specifically recommend policies to moderate injustice, his account of the origins of civil strife implies them. Once we know the things that destroy regimes, we also know the things that preserve them (P 1307b25). It is also worth noting that Aristotle's discussion of regime preservation does not necessarily mean he is a stooge of the status quo. It follows that if we know what preserves regimes we also know what undermines them.

¹⁴ This seems to be one reason Aristotle insists that *phronem* is a single virtue with several different manifestations, such as the practical wisdom required to do politics and household management (NE VI 8)

¹⁵ Terchek and Moore are right to point out that citizens within regimes often engage in heated disputes over the meaning of the good life. But they overestimate the need for some deep consensus on the good in order for statesmen to act well. For instance, Terchek (1997, 216–25) holds up Lincoln as an example of a good politician.

Yet, Lincoln acted virtuously amid the disagreements of the Civil War in the absence of a plebuscite or joint resolution of Congress on the meaning of the good. Terchek and Moore insust that I overlook the fact of political disagreement in my desire for citizens to act well, but this kind of shining public action does not require some deep overlapping consensus, only wisdom and courage.

¹⁶ I argue in my article that the demand side of mjustice stems from our tendency to take too much of what Amstotle calls the "goods related to fortune." I go on to give Aristotle's list of these goodshonor, power, and money. Terchek and Moore claim that I think we should avoid every external good, but in doing so they conflate the goods related to fortune with all other external goods. Since they miss my distinction between different kinds of external goods, they mischaracterize me as an impractical Puritan who devalues children, health, property, marriage, and friendship for the sake of some self-denying conception of virtue. This leads them to claim that I will not give citizens a stake in my apolitical regime, since I will not let them have property and stability. That overlooks my argument that by overgrasping for the nonshareable goods of honor, money, or power we lose sight of the value of shareable goods, such as friendship. Indeed, my examples of shareable goods are the very ones that the authors say I spurn (Smith 1999, 632-3).

achieve what my critics want them to. Where does this practical wisdom come from? Terchek and Moore are right to say that experience in politics is a necessary condition for its development, but is it a sufficient condition? Can a politician single-mindedly obsessed with advancing her own power or honor acquire practical wisdom? Or is her overgrasping ambition a clear sign that she has left the path of wisdom? Can a money grubber obsessively concerned with his material wealth be said to possess wisdom? Or is excessive love of money a tangible manifestation of foolishness? My critics ignore Aristotle's argument that overgrasping for honor, power, and profit are inimical to the wisdom and justice that even a clearheaded devotion to the common advantage requires.

Can the common advantage Terchek and Moore want be sustained indefinitely in the face of a regime full of narrow self-promoters who skirt the institutions and laws intended to keep them in their proper bounds? Can communities survive through competition and mutual suspicion of differences? Or is it the privilege of human beings to need interdependence, justice, forebearance, and mercy?¹⁷ If our regimes require these qualities, then it is in our interest to develop them, as difficult and subject to dispute as they are. And if such virtues are needed to sustain the political communities that sustain us, we cannot bifurcate virtue and self-interest simplistically. If politics demands these virtues, we cannot say an argument for them is apolitical and impractical. Proceeding from these reflections, it is eminently practical to wonder about the conditions of a political community in which each is valued because each contributes through diverse talents and perspectives to shareable goods all can enjoy. For Aristotle, all regimes form the characters of the citizenry, so all cultivate determinate conceptions of virtue. To him the question is not whether virtues will be cultivated through politics but what kind they will be. It may be a dangerous kind of thoughtlessness to refuse to wonder about the virtues a common good requires in the name of a narrow conception of "practicality."

BOOK REVIEWS

Political Theory

Democracy, Real and Ideal: Discourse Ethics and Radical Politics. By Ricardo Blaug. Albany: State University of New York Press, 1999. 229p. \$65.50 cloth, \$21.95 paper. Democracy in Dark Times. By Jeffrey C. Isaac. Ithaca, NY: Cornell University Press, 1998. 250p. \$45.00 cloth, \$16.95 paper.

Barbara Cruikshank, University of Massachusetts

These are two deeply pessimistic books about the current prospects for democracy. The authors valorize civic or popular struggles over and against the state and nation, but they do not exaggerate the potential to transform the present political order or to transcend the limits of liberal democracy. Isaac writes: "At the level of the nation-state the 'rule of the people' must always be more or less metaphorical, channeled, diluted, and corrupted by mass political organizations and bureaucratic structures" (p. 120). He stresses the value of imperfect forms of political response and oases of civic initiative, such as ACORN, the Algebra Project, Planned Parenthood, Amnesty International, and Charter 77. He argues the need to replace the populist vision of massbased reform movements with localist initiatives; his is a modest and pessimistic progressivism. Blaug is more blunt and more radical: "That we could ever learn to be citizens on such a scale as to be able to rule ourselves must be considered very close to impossible" (p. 156). Nevertheless, he concentrates on the possibility of extending the life of "democratic breakouts," or social movements, beyond their initial mobilization to the point at which they can take on the revolutionary task of building democratic institutions.

Isaac, in particular, delivers a compelling, if dark, portrait of the present. His title, Democracy in Dark Times, echoes Hannah Arendt's collection of essays, Men in Dark Times (1968). Isaac refers to the meaning of 1989, to the opacity of democracy in the post-Soviet era. Far from triumphal, the liberal democracy emerging from 1989 (in the East as well as the West) is nearer a state of barbarity, and civic initiative can just barely resist the corruption endemic to the large-scale bureaucratic politics of the nation-state. The initiatives to which he refers—Solidarity, Industrial Areas Foundation, and battered women's shelters, among others—aim to amplify public outrage at the horrible injustices and mass slaughter darkening the present as well as at the cover-ups, the ways people are inured to horror by the media, bureaucratic dissimulation, and cynicism. Isaac is certain that the prospects for democracy in the present are limited to such initiatives, "oases in the desert" of democratic politics.

Rather than turn to theory for a vision that could transcend the limits of liberal democracy, both authors attempt to make political theory speak directly to the present. They do not abandon or reinvent political theory so much as they attempt to reshape our expectations of it to fit the limitations of the political present. It is on this score that readers will be rewarded, not with new approaches or answers to old questions, but with a glimpse at what democratic theory might accomplish once, in Blaug's awkward phrasing, we "change the object domain of application." That domain, in both books, is at the level of association or organization where individuals struggle to practice democracy under imperfect if not horrifying conditions. Blaug abandons the terrain of the ideal speech situation in order to apply the discourse ethics of

Jürgen Habermas to the real problems of judgment encountered by political actors. Isaac attempts to shift the focus of political theory to first-order political questions and away from the problems of interpretation and epistemology. Both eschew any analytical effort to reconceptualize the political; their efforts are directed only to the forms of democratic action now available.

For all their shared focus on democratic participation, however, the two disagree sharply on the question of whose participation matters. Despite his own pessimism, Blaug struggles to retain some hope for mass democracy, whereas Isaac's politics, local and voluntarist as they may be, are elitist. Noting that Arendt was no friend of mass democracy, Isaac plays her elitist and democratic sides off one another to tease out what he believes is a truly democratic elitism. These Arendtian elites "are distinguished by their insulation from the many, not by their rule over them" (p. 104). As selfselected, such elites are distinguished only by their extraordinary civic mindedness and love of freedom, not by their wealth, political experience, or power. Isaac attempts to convince the reader that Arendt's argument is unconventional but not antidemocratic, that it is possible to be both elitist and democratic in the same breath. He asks: "But again, what about the masses" (p. 107)? Yet, he cannot give an adequate answer. Although he holds political theory to the fire, Isaac nevertheless concludes that even a more relevant and engaged mode of inquiry is not likely to find an audience in a world "in which political illiteracy and public attention deficit disorder are endemic" (p. 56). Pessimism about the prospects for mass democracy are requisite for Isaac's version of a political theory attuned to the present.

Whereas Isaac's collection of essays revives (some might say "invents") Arendt's democratic theory, Blaug finds few sources for a theory of radical democratic politics in the work of Habermas. He concludes: "There is no Habermasian politics" (p. 82). Blaug's project is to explain why. The first three parts of the book offer an arduous account of why Habermas fails to offer much to political actors and how the theory of deliberative democracy reduces radical democratic politics, at best, to a temporary counterfactual. Blaug then gestures too briefly toward the Italian Renaissance language of political action to bridge the divide between the real and the ideal, or the empirical and normative in democratic theory. On the subject of participation, in a chapter entitled "Changing the Object Domain of Application," Blaug leaves the problem of ideal speech behind, and his work comes alive. He startles the reader with a dramatic change of writing style and by turning to the empirical problems of sustaining a "democratic breakout." He offers a vital study of a generic social movement to explore the problems participants face in order to sustain its democratic legitimacy beyond its own institutionalization.

A key problem for both authors, treated as a contradiction by Blaug and a paradox by Isaac, is that the sources of genuine democratic participation and legitimacy under liberal democracy are to be found only in the most fragile political practices. Any incorporation or institutionalization of these democratic practices saps their legitimacy and deliberative strengths. Although neither cites the work of Frances Fox Piven and Richard Cloward (*Poor People's Movements*, 1979), both revive the problematic of movement mobilization versus organization. Isaac argues: "This tension between civic initiative and mass political organization is the terminal condition of modern democratic politics" (p. 122). The paradox is that any attempt to bolster civic initiatives will prove corrosive because they must remain small, participa-

tory, and nonbureaucratic. For Blaug, the tradeoff between participation and efficiency leads to a contradiction that follows from "the entropic nature of legitimacy" (p. 144), when the collective and discursive processes of democratic breakouts become normalized. Neither author offers a solution for this problem. Like Piven and Cloward, they attempt to reorient political analysis to the fragile, even ephemeral practices of democratic participation.

Isaac gives a passionate account of how constricted various national democracies are, not only by state and ethnic violence but also by the "aversion to first order inquiry" of most contemporary democratic theory. He scrutinizes the treatment of 1989 events in American political theory and finds a "strange silence" on the subject. (His indictment is debated in several essays in Theory & Event [http://muse. jhu.edu/journals/theory_+_event/vool/1.1wolin.html]). Much in Isaac's account of contemporary political theory rings true, especially its tradition-laden and overly academic character, but he roundly refuses to engage the attempts by cultural theorists, poststructuralists, queer theorists, postcolonialists, and feminists to reinvent political theory, favoring "less culturally radical forms of political association" (p. 15). Unfortunately, he does not thoroughly explain his preference despite the fact that these theories so deeply influence many of the civic initiatives he so values. Similarly, Blaug limits himself to the works of Habermasians, with a brief appearance by Wittgenstein. Both of these books would be improved by first-order engagements with theoretical movements that are also searching for sources of democracy in the present.

Although they are generally critical of the current state of political theory, both authors remain firm believers in the idea that political theory can and should inform political life. (Of the two, Isaac has the better chance of reaching a politically engaged audience; his essays are eloquent and readable. Blaug writes in a style familiar only to those versed in discourse ethics, with the clear exceptions of his introduction and the last two chapters, which are more readable.) Isaac holds that the role imagined for political theory in the Enlightenment is hopelessly antiquated in the postmodern polis, yet he hopes to revive the humanistic, antimodern, and action focus of Arendt to secure a guarantee of human dignity as a new universal foundation for democratic politics. He wants to sustain the humanistic strains of political theory in the struggle against injustice, but he abandons the idea that a single grand theory or struggle will procure justice. Although still wedded to the Enlightenment view of political theory, Blaug attempts to reorient theory away from the grand scheme to the practical concerns of political actors. Both authors favor the provisional over the visionary and prescriptive conventions of political theory. For all their pessimism, their approaches will surely inspire others to follow more provisional pathways to political theory and democracy.

Democratic Devices and Desires. By Geoffrey Brennan and Alan Hamlin. Cambridge: Cambridge University Press, 2000. 267p. \$59.95 cloth, \$22.95 paper.

James Enclow, University of Texas at Austin

The central argument of this book is that the standard rational actor model is an impoverished representation of individual motivation. To replace it, the authors use a modified form of rationality, one that allows individuals to be

guided by moral and other considerations that are not "instrumental." Part 1 focuses on the nature of individual motives ("desires"), and Part 2 asks how different democratic institutions ("devices") can be expected to function from a normative standpoint under the modified rational actor model. The primary conclusion is that popular elections, representation, political parties, separation of powers, and division of powers all better serve the public interest if citizens are represented by a model of "expressive" rationality rather than by the standard model.

As the authors make clear, their purpose is primarily normative. Their model of modified rationality is never mathematized (with a brief exception in chapter 6), and their arguments are almost entirely verbal. The few examples scattered throughout the text are of some interest, but the use of modified rationality is ad hoc, generally represented by an arbitrary constant added to the standard model (as in chapters 6 and 8). Still, the arguments are appealing, and it would be interesting to see how standard results in public choice theory might be altered by a fully developed model of modified rationality. The problem, of course, is that one does not exist.

It is possible to take exception to some of the characterizations of the standard model. The authors argue for expressive voting because instrumental voting makes little sense in mass elections. This fails to note that politicians, not voters, are the strategic actors in this setting. Also, the authors appear to be unfamiliar with several standard voting models that answer some of their concerns. Probabilistic voting is a case in point. Models with candidates who have nonpolicy characteristics as well as issue positions are another. Also, a number of works using the standard model allows voters to abstain from alienation, contrary to the authors' belief (p. 135).

Brennan and Hamlin argue that the standard model takes a negative view of such institutions as representative government, political parties, and the rest. I find this argument understandable but somewhat forced. Standard public choice analysis typically takes political institutions as given rather than ask such questions as whether the public is better served by representative than direct democracy. Normative questions of this type are typically outside the scope of public choice theory, both because most researchers are positively (i.e., scientifically) oriented and because almost any set of normative criteria can be expected to be mutually inconsistent (à la Arrow). So, forcing public choice theory to "take sides" on the question of whether institution A is normatively preferable to institution B is somewhat contrived and, given the complexity of the literature, probably impossible.

As long as the normative purpose of the authors is kept in mind, the book makes many telling points. A common-sense rationality characterizes most of the arguments, but I think the authors generally miss the point that rational choice theory is designed to do scientific analysis rather than answer normative questions at the societal level. The rationale for homo economicus is not that he realistically represents human motivation but that this assumption allows the deduction of a mathematical set of empirically testable propositions. If "moral man" can be given the same mathematical foundation as "economic man," then empirical testing will tell which is the better model. Without such a foundation, morality is simply an "add on" to the basic model.

Republican Theory in Political Thought: Virtuous or Virtual? By Bill Brugger. New York: St. Martin's, 1999. 211p. \$59.95.

Timothy Burns, Skidmore College

At a time when communitarians are moderating their once radical critique of liberalism by an embrace of individual rights and liberals are calling for more robust community, Bill Brugger offers to satisfy both groups with "republicanism." The title refers to an old paradox of republican self-government: The people are both sovereign and subjects, rulers and ruled. Since immoderate and partisan appetites sometimes move us toward domination and license, we must somehow rule over ourselves. We can do so in a classical or communitarian manner, by cultivating self-sacrificial virtues informed by a notion of an exalted common good. Or we can do so by delegating rule to representative lawmakers who will determine by cool deliberation what a rational collection of individuals would choose for its security and comfort. This second and characteristically modern or liberal solution is indirect government, or what Brugger calls "virtual republicanism." But Brugger argues that the division drawn between the two kinds of self-rule is overdone; modern republicanism always intended to provide the best elements of both virtuous community and individual freedom secured by liberal institutions. Properly updated, it can still do so.

The pressing need to do so is found in the face of democratic wave theorists, like Francis Fukuyama, whose view of democracy ignores and therefore abets "half-understood structural domination" (p. 20; see also pp. 118, 120, 126-7, 152, 163, 175, 181). Brugger thus appeals to the Left's long-held suspicion that liberal democracy is quietly, structurally oppressive—that its official neutrality or tolerance on questions of the good life permits and fosters domination or marginalization in the private realm. In particular, he stresses that globalization has seriously weakened popular sovereignty, permitting a corrupt, monied, power elite to eclipse the people's formal representatives and make those outside of corporate organizations "in effect second-class citizens, victims of a process of social and political marginalization" (p. 62; see also pp. 75, 122, 131-4, 164-5, 175). Virtuous republicanism seeks freedom from this and from "all dominating relationships." It would extend nondomination "to children, women, and many others. . . . [It] must appeal to socialists, environmentalists, feminists, and advocates of multiculturalism" (p. 42; see also pp. 127, 131, 137, 141). Republican nondomination would extend the liberal state's concern for freedom into the social or private realm.

Liberals, Brugger knows, will worry that his concern for virtue and freedom will yield not freedom but totalitarian oppression (p. 16; see also pp. 20, 29, 60, 134). And they would be right, he stresses, if they were speaking of states with premodern foundations for virtue, such as Aristotlean logocentric theory, or daoism in China, or purity in Hindu India anywhere "fixed functions based on an overriding principle . . . are the primary source of identity" (p. 175). But the modern republican tradition is different. It "was capable of bracketing off logos and developing practical reason from which a distinct view of political liberty and individual political efficacy could emerge" (p. 175). It attempted to distill "explicitly civic virtues" out of the moral or ethical cardinal virtues elaborated by classical writers (pp. 3, 17). A "fundamental rupture" from an "inflexible logos" was able to "open up the possibilities for a this-worldly civic liberty." Modern republicanism replaces an "extravagant faith in spiritual leaders" with "a separate realm of civic virtue which centres on the notion of a citizen who is a potentially active

participant in politics" (pp. 166-7). Modern republicans reject "imposing a particular form upon society," one based on a notion of human fulfillment. They see human nature as plastic, as "created in the political process." The modern republican telos is therefore cast "in terms of an absence—nondomination—rather than in terms of fulfillment" (p. 15).

The achievement of this new republicanism began, Brugger argues, with Machiavelli, who changed the meaning of virtue (p. 116), and it now finds its completion in Rawlsian and postmodern pragmatism. Machiavelli's new virtue "owed nothing to any divine order and consisted simply in a willingness to do whatever was necessary for civic greatness and, if that involved qualities more appropriate to the beast than the man, so be it" (p. 33). Virtue was no longer self-abnegating but instead compatible with individual interests. Machiavelli also encouraged us to view religion as a mere means in the promotion of civic order and thus to be unconcerned with its truth (pp. 36, 51, 71, 188 n. 2). The consequent destruction of religion secured the "autonomy of," the political." After Machiavelli, republican thinkers moved still farther from "a focus on a divine cosmos" and produced a healthy weakening of natural law or "universality of values?" (p. 16). Justice as "political and not metaphysical" is what "four centuries of republicans... have been groping for" (pp. 10-1).

Brugger builds the case for this understanding of an evolving pragmatic republicanism by constructing "four variations on the ideal-type of republicanism—early modern (Machiavelli, Sidney, Milton); Enlightenment (Montesquieu, Rousseau, Kant), mechanistic or American (Madison, Jefferson) and contemporary (Pettit, Sunstein, Barber)." Each is accorded a chapter in which Brugger presents the variation's respective view of popular sovereignty, its understanding of history (cyclical or progressive), the place it accords to virtue and law; and its conception of liberty. In a fifth chapter, he examines the (dim) prospects of republicanism in the developing world.

The republicanism that emerges from this narrative "affirms popular sovereignty, is sensitive to [structural or systemic] corruptibility, asserts the value of civic virtue and upholds a view of liberty as non-domination" (p. 181). It satisfies liberal neutrality by "having the state acknowledge only the ecumenical or non-sectarian good represented by the freedom of its citizens" (p. 9). Yet, it is republican and not liberal in that it promotes not merely noninterference but nondomination. It entails vigorously defending the right to "define our own private sphere." In short, modern republicanism lies somewhere between the autonomous self of liberalism and the collectivist or "holistic" ontology of communitarians (pp. 139–42).

Brugger's is a rich and subtle account of modern republican political theory and of its enduring relevance, but the book is not without difficulties. Being derivative and eclectic, it is obese with names and shorthand summaries of argument. Readers must wade through passages like the following:

It would be interesting to speculate on the virtual virtue of virtual republicanism, noted by Ronald Grimsley (1961, 77) in Rousseau, or what Kant's enlightened philosophers, which, in Gramscian terms, were to be "organic" to his prescribed state, would have done with it. Kant, after all, was noted for what Gareth Stedman Jones (1994, 171) described as the "pedagogic state" backed up by philosophers (p. 72).

More substantively, Brugger's account of a progressive and liberating battle toward a postmodern pragmatic republicanism is not convincing. He assumes, although he does not spell out or begin to defend, the fashionable claim that "logocentric" reflections on justice in classical political thought were born out of a fear in the face of flux. But as he is compelled to imply in his survey of nonliberal regimes, the view of justice as categorically or rigidly demanding self-sacrifice is not limited to the "logocentric" pre-modern West. It belongs rather to political life as such. Even early modern republicans saw the need to make substantive arguments about "natural rights"; Brugger too easily dismisses their arguments as "rhetorical" rather than "deontological" (p. 43). And while freedom for Kant may have been "freedom from domination" (p. 78), in The Metaphysics of Morals Kant spells out very strict universal moral imperatives that are to free us from our baser selves, imperatives that Brugger, if he had not ignored them, would have to call "domination."

Above all, the "fixed" demand of a universal and categorical justice—the demand that we serve a common good even against our interest—is felt by Brugger himself. He makes it a part of his republicanism. He asks us to accept the "belief" that "politics has the potential to generate disinterested deliberation in the search of a common good," a belief that will itself "further that common good" (pp. 130, 133). But his account of a modern republicanism leaves no room for devotion to such a common good. Machiavelli made virtue compatible with self-interest by rejecting justice understood as a high, common good requiring sacrifices of us (pp. 22, 69-70, 106 with 34, 40, 68, 103, 168, 170). Virtue must no longer mean choosing correctly but "grasping" against fortune; it must mean being out for oneself and by oneself, through leonine force or foxy fraud, in a hostile world (pp. 34). But if this is what it means, then one who is devoted to a common good is merely a sucker. Brugger never explains how virtue can be both self-interested, even fraudulent, and yet entail a devotion to the common good. But he is not bothered by contradictions. Unlike the modern political philosophers that he has read, he fails to see why we cannot have contradictory things (pp. 181–2).

Serious political consequences can arise from failures of this sort. Brugger's republicanism of nondomination might appear to be little more than a radicalized version of liberalism. But the following clear and honest statement about "civility," the one virtue that the new republicanism truly requires, shows that it will not secure the freedom it promises: "Civility is not just a matter of denying the personal self. It is also a matter of letting other identities take over in your person" (p. 134). How letting this happen constitutes nondomination is a great mystery. In fact, it seems to be the very essence of domination, especially when we consider that "certain "normative measures are needed" to foster the desired "flexible identity" or "multiple patterns of identification" (p. 134). These normative measures would require in turn various "constraints on democracy," both within existing institutions and through the creation of new ones (pp. 144-8,

These constraints are chilling to liberals. They make it hard to avoid the impression that Brugger's republicanism, in attempting to do away with the quiet domination of the neutral liberal state, would bring about a more complete, official domination of individuals. Whether the postmodern pragmatist misology that lies behind this prospect grows inevitably out of modern political philosophy is, however, a serious question, and it is to be hoped that Brugger will bring his considerable talents to bear on it in future work.

(Un)Manly Citizens: Jean-Jacques Rousseau's and Germaine de Staël's Subversive Women. By Lori Jo Marso. Baltimore, MD: Johns Hopkins University Press, 1999. 192p. \$38.00.

Instinct and Intimacy: Political Philosophy and Autobiography in Rousseau. By Margaret Ogrodnick. Toronto: University of Toronto Press, 1999. 238p. \$50.00.

Rousseau's Republican Romance. By Elizabeth Rose Wingrove. Princeton, NJ: Princeton University Press, 2000. 272p. \$60.00 cloth, \$19.95 paper.

Eve-Grace, Colorado College

Lori Jo Marso combines a discussion of parts of Rousseau's works on political theory and literature with a study of Stael's novels, Delphine and Corinne ou L'Italie, in order to point to an "alternative vision of citizenship" (p. viii). This alternative is urgently required because our politics has at its core the ideal of the "manly," or alternatively "rational," citizen, whose very conception of the common good or general will is constructed through the systematic "philosophical and political exclusion of women" (p. 2). This ideal, Marso argues, has its roots in "the 'primordial error' of Western philosophy," that of "ontologiz[ing] universals and reduc[ing] particulars to mere exemplars" (p. 75). Marso turns to the portrayal and celebration of "subversive women" in Stael and Rousseau for the purpose of examining their "dissatisfaction with a society that is above politics," that is, with a politics that suppresses difference, contradictory goods, and particularity, a politics that is unable to embrace loyalties to friends, family, and loved ones as well as loyalty to the community (p. 75). Whereas all Rousseau's male characters represent attempts to construct "manly citizens" who necessarily take "the reason and sentiment of one man . . . [as the] general will of all," and who as such "inspire nothing but contempt," these women both represent and champion the "excluded and marginal" (pp. 41, 50, 56-7, 69, 72, 74).

Marso's book constitutes a refreshing departure from much of feminist scholarship on Rousseau by considering in detail what the author describes as "Rousseau's sympathies with his women characters and the delicacy and strength he puts forth to portray them" (p. 6). She argues that through his female characters, Rousseau reveals his own "ambivalence about constructing gender differences in terms of the male model." The "feminine presence" in his works both "acknowledges radical difference" and points to a politics "unable to be consumed by the male imagination" (p. 7). Inspired by this alternative perspective in Rousseau, Stael portrays the heroines of her novels as defying the "constraints of women's presumed identity in denying the framing of a choice between public and private life" (p. 126). Staël further shows us that masculinity is deficient in creating "moral citizens," because the "manly" citizen's reason cannot comprehend "passion, engagement, and interdependence (with certain identifiable others) as integral to moral political action" (p. 106).

The "alternative model for citizenship" that arises from a consideration of Rousseau's and Staël's women presents "love for family and intimate friends [as] a model for the care, respect, and justice desired by all" (p. 137). The alternative model leads us to consider those "situated on the margins" because it automatically "integrates individual passions and goods with the larger good of the whole" (p. 105). Rousseau's careful explorations of the possibilities, difficulties, and limits of justice and of love, however, repeatedly

require us to confront the realities of power and clashing wills, consideration of which realities is notably missing from Marso's book. It is likely that care, justice, and respect are desired by all, but in Rousseau's view that desire does not guarantee its own satisfaction in the face of "the incommensurability of human goods" (p. 106). Hence, for him, our need and desire that women, as well as men, move from self-love, through love for family, to care and just regard for all constitute a problem, not an answer.

Because the following claims are pivotal to Marso's argument, it would have been helpful to clarify, for example, how "basic tenets of Enlightenment thought" give rise to the model of "'manly' citizen"; how "mysogyny and xenophobia" necessarily have their "deep roots" in "philosophy"; in what way Rousseau's politics is a "communitarian dream of the transparent and unified whole"; or how his texts represent the "triumphal moments of Enlightenment reason" (pp. 129, 131, 136, 132). These claims may ultimately be true, but their bare statement without significant elaboration suggests self-evidence, which is surely contestable.

Wingrove's confident, complex, and provocative book takes up the central Rousseaun questions of power and will. Using narrative analysis of Rousseau's philosophical as well as literary works, Wingrove seeks to flesh out "the political work that gender does for republican theory" (p. 14). Understanding how gender and politics are mutually constitutive is crucial, in her view, to understanding how Rousseau reworks, but does not resolve, the "dilemma of conventional authority," a dilemma articulated by the famous paradox in the Social Contract that citizens are "forced to be free" (pp. 243-4). The problem of how to harmonize obedience and liberty is generally understood to be resolved by him through the doctrine of submission to the general will, by which each citizen sovereignly commands the law that in turn subjects him or her. Wingrove, however, seeks the tangible forces that invigorate this abstract form. She argues that Rousseau points to erotic desire as "the passion to be reckoned on" (p. 244). If we look to Rousseau's account of sexual relations, and of the mutual constitution of political and sexual orders, the heart of "consent" will be revealed as a "consensual nonconsensuality, meaning the condition in which one wills the circumstances of one's own domination" (p. 5). Consensual nonconsensuality describes an interplay of coercion and cession, force and will, which is the fabric of relations between bodily beings who find that the satisfaction of desire necessarily entails both domination and submission. This interplay of power and will, she argues, is the stuff of romance, and romance the stuff of democratic self-rule.

Wingrove argues, contrary to Rousseau's firm statement that "man" and "citizen" are contradictory ideals, that these are simultaneously formed through induction into a heterosexual and political order. The very possibilities of "authenticity" and "identity" are produced through physical or bodily conditions that are always "organized" politically: Self-consclousness arises with, and is therefore constituted through, hierarchies of ruler and ruled, strong and weak, desired and desiring, all which hierarchies emerge from the ways we first experience ourselves and others as masculine and feminine objects. Heterosexuality itself, however, and the binaries it produces masculinity and femininity, power and submission, sensual passion and reason—are all "a function of Rousseau's politics" (p. 51). Since the "possibilities of being and seeming to be emerge coincidentally," no "unmediated identities" are possible: We are the creations of relational amour-propre. As such, juridical, political, familial, and sexual practices above all condition the "factual and fictional positioning" that structure "identity" (p. 41). Hence "submission and domination are the natural concomitants of human *perfectibilité*, inasmuch as an awareness of will, world, and self entails the recognition, which is the experience, of coercion and consent" (pp. 36–7).

It is this awareness and recognition, produced through rhetorical and "performative" civic and sexual practices, that animate the "imaginative dimension of political consciousness" (p. 216). Wingrove develops this account by detailing how the core of Rousseau's democratic politics is the gendered spectacles in which citizens celebrate nation, family, and love as the images animating and constituting the "pleasures of their mutual bondage" (p. 204). She is led to conclude, therefore, that "autonomy" or "political and moral agency," in both men and women, is "possible only in the context of, through the enabling and constraining structures" of, a "social system organized by sexuality" and "a political order that is always, in the final instance, coercive" (pp. 77, 230).

Wingrove's confidence in the nullity of Rousseau's claim that man and citizen are distinct ideals seems, in part, to arise from the presuppositions, derived from her reading of Emile, that a sense of self only arises with sexuality, and that the "natural man's" "dominant passion" is to "live in a world...peopled by catizens" (p. 197). Her claim that amour-propre, will, and power, necessarily "mediated" by our encounters with the world, are the constitutive dynamics of the Rousseauian self is more than plausible. Still, their necessary identification with sexuality seems less so, since these dynamics are described as fully present prior to puberty. Although sexuality potently serves to give them further form, it is not required to set them in motion. This suggests the necessity of a reconsideration of "asexual humanity," or self-love (p. 70). Furthermore, it is not too much to say that Rousseau would not be worth reading if he were not keenly alive to the subtler varieties of force and fraud in the world and in democratic politics; nevertheless, unlike Wingrove, the issue for him does not seem to be simply how political "possibilities are imagined and practiced" (p. 152). These practices, in his view, have real consequences that we cannot help but judge in light of a concern for well-being. For Rousseau, the question of nature remains a question, one that Wingrove's interpretation may not sidestep as easily as her "antifoundationalist commitment" might suggest (p. 9).

Cooper wades right into the middle of this most complex and problematic of questions in Rousseau's thought, the difficulty of which is reflected in the disagreement within Rousseau scholarship over its character and status. Cooper's ambitious and impassioned book, which takes up the cause of the "sublime" in Rousseau, examines "nature" in light of the character of morality or conscience and happiness. In Cooper's account, Rousseau, sharing as he does "the general principles of modern science," deepens modernity by developing its reflections upon nature necessarily understood in terms of origins (pp. 186, 12, 39, 70, 73). He "rejected the naturalness of any kind of moral or psychological dualism" (p. 117). In light of this understanding of nature, health is understood as the actualization of a "formal" standard of nature, the condition of "psychic unity and balance" that characterizes the human animal in the state of nature (pp. 183, 180). Significantly, however, Cooper disagrees with the view that Rousseau found "no place for the sublime in the modern scientific explanation of man," and he goes on to argue that Rousseau "did not need to postulate the derivation of the sublime from strictly nonsublime sources" (p. 82). A "substantive" standard of natural fulfillment, a "post-stateof-nature-naturalness," is manifested by ends embedded in our nature, which in turn are revealed to us through the

conscience, that is, through an "innate" love of the "order" that is expressed by "the harmony of the cosmos" or "creation" (pp. 11-3, 92, 59).

Cooper states that "Rousseau never calls conscience a principle of soul." (Rousseau means by such a "principle" a fundamental inclination "anterior to reason" from which all other passions are derived: In the Second Discourse, he identifies these as "self-love" and "compassion.") According to Cooper, it "suited Rousseau not to bother identifying principles of soul in Emile." Nevertheless, if he had "used the Second Discourse's scientific methodology on Emile, he would have identified the love of order—that is, conscience—as a principle of the civilized natural man's soul" (p. 94). Conscience is the "one thing that is sublime from the start" and "is natural in the strongest possible sense: it is an innate principle in the soul whose awakening from latency is automatic and irreversible in civilized man" (pp. 82, 11). It includes "aesthetic," "philosophical," and "scientific sensibilities," as well as constitutes "the innermost meaning of goodness, virtue, and justice" (p. 95). Upon this basis, Cooper engages in detailed discussions of Rousseau's texts in order to fashion an account of the development of civilized naturalness through the "developmental template" of conscience, a development in which the formal and substantive natural standards in Rousseau's thought are made to coincide (pp. 11, 100).

This development confronts, however, the central problem of amour-propre: Although it necessarily transforms the "fundamental needs" experienced by civilized human beings, amour-propre always threatens to destroy any harmonious development of self-love guided by the conscience. Therefore, in what is perhaps the best part of the book, Cooper justifiably seeks to correct prevailing accounts of this fundamental Rousseauian concept by putting forth an interpretation of the characteristics of amour-propre and self-love. His interpretation is based in part on the postulate that, since Rousseau describes himself as not being "dominated" by amour-propre, Rousseau's characteristics necessarily serve as a template of self-love and therefore cannot be ascribed, as they sometimes are, to amour-propre (pp. 139-43). This interpretation leads to an account of how to govern the extent and character of amour-propre in order to realize the end of "civilized naturalness."

Cooper concludes that Rousseau's "dual-level conception [of nature] allows him to reestablish the naturalness of the sublime and thereby redeem human dignity from the clutches of modern scientific naturalism" (p. 186). His book ends with a critique of Rousseau's attempt to construct "an understanding of the good life" upon "nonteleological" foundations, suggesting that Rousseau is dangerously mistaken in teaching us that amour-propre is unnatural, for that teaching undermines "longing and aspiration" (pp. 15, 207).

Drawing upon Rousseau's philosophical and autobiographical works, Ogrodnick engages in a psychoanalytical analysis of Rousseau's account of the modern self as the "primordial base" of his political and philosophical thought (p. 17). "Conceiving philosophy as in part an unconscious memoir," Ogrodnick attempts to dig down to the "psychocultural" roots of the modern self as it is expressed by, and through, Rousseau (p. 46). She therefore analyzes Rousseau's autobiographical works as the most immediate expressions, and the philosophical works as reflections, of Rousseau's unconscious. The unity of his thought arises from the "primordial vision" of Vincennes, in which the "archaic residue embedded in our deepest psyche," erupted to reveal to him "humanity's primal beginnings" (pp. 36-7). This vision is filtered through a pattern of "psychocultural dichotomies" that are not idiosyncratic to him but are reflective of the "modern Western epoch" (p. 15). These unconscious dichotomies are threefold: masculine versus feminine; desires for absolute self-sufficiency versus total union; and good and evil. By teasing out the workings of these manifestations of the unconscious through a "phenomenological" investigation of the "parallel personal and theoretical engagement[s]" in Rousseau's texts, Ogrodnick seeks not only to clarify and revitalize Rousseau's vision but also to validate the psychoanalytical approach she employs (p. 42). Although mindful of its difficulties, she claims that its "credibility" depends upon its ability "to resolve textual complexities and interpretative controversies . . . [that] it would have been difficult to see and configure" without it (p. 44).

In a detailed analysis, Ogrodnick argues that Rousseau's project was to retrieve "instinct" as the "emotional foundation" of a "politically intimate polity," thereby challenging accepted distinctions between the private and public realms (p. 19). Beginning as he does with the radical "atomism of liberalism," Rousseau must reconcile the conflict between duty and interest concomitant with citizenship by "deriv[ing] civic attachment from the development of private sentiment (pp. 187, 172). This reconciliation is accomplished through the "catalytic effect" of intimate familial and romantic ties. These, "extending the self" by channeling "instinctual compassion and self-love" into "civic friendship," cause a "fusion between self-care and other-care that turns harm to a fellow citizen into a self-infliction" (pp. 172, 160, 171, 138). Rousseau thereby accommodates "both the autonomy of the rights-bearing individual and the attachment of the communitarian self" (p. 163). Ogrodnick's account correctly identifles such a project as central to Rousseau's prescriptions for citizenship, but it encounters a difficulty similar to that encountered by Marso's account. Rousseau himself, as Ogrodnick notes (e.g., pp. 160, 187), shows repeatedly that links between civic virtue and individual flourishing are difficult to forge. Much the more salient portion of a physical being's "self" is its physical existence, which is the condition of all goods and cannot be shared. The relationship of an individual to the others who comprise "community" can never be understood as simply "constitutive" for this reason. In light of this difficulty, the absence in Ogrodnick's work of a treatment of the fundamental role of religion and of the limits and difficulties of compassion in Rousseau's thought prove to be problematic.

Ogrodnick may not fully succeed in demonstrating decisively her claim to resolve contradictions in Rousseau's political and philosophic thought that cannot otherwise be resolved than through the kind of psychoanalytic approach in which she engages. She does, however, perform an important service and raises many useful questions in highlighting a problem that Rousseau so forcefully and artfully asks us to confront, namely, the basis and motives of philosophy. It is intriguing to wonder what results Ogrodnick would have arrived at if she had attempted to elaborate Rousseau's thought on this matter not only in terms of the psychology of Jung, Merleau-Ponty, or Benjamin but also in terms of Rousseau's own psychological account.

Fugitive Theory: Political Theory, the Southern Agrarians, and America. By Christopher M. Duncan. Lanham, MD: Lexington Books, 1999. 244p. \$65.00.

Mark Stephen Jendrysik, University of North Dakota

The American South is unique. As Christopher Duncan notes in this provocative volume, only the South inspires true love or true hate (p. 4). He addresses the ideas of one set of ardent defenders of the South, the agrarians, who arose in the wake of the Scopes trial and sought to defend what they saw as a unique southern culture against the forces of materialism and centralized capitalism.

In examining the work of Allan Tate, Donald Davidson, John Crowe Ransom, Robert Penn Warren, and others who contributed to the classic statement of the southern agrarian position, I'll Take My Stand (1930), Duncan argues that they provide a useful alternative vision of American political and social life. They spoke (and for Duncan continue to speak) against the dominant paradigms of possessive individualism and liberalism that control our cultural universe and our intellectual horizons as Americans. But they were not solely negative. The agrarian idea seeks to avoid the effects of huxury or ease through hard work (p. 13). In Duncan's view the agrarians fought for a vision of civic republicanism informed by the ideal of "true republican independence" and "social bond individualism" based on land ownership (p. 141). For them, the agricultural South most closely approximated the conditions necessary for virtuous, uncorrupted life and therefore for effective political and social participation. They saw themselves as defending a unique and valuable form of life, a true community, against the atomizing forces of modernity. Understanding the southern agrarians as communitarians before their time, Duncan does not seek to obviate the problems raised by their thought. But he asks us to take them seriously as thinkers and as prescient observers of the effects of modern economic and social change. In presenting the South as a community, Duncan asks the reader to drop any academic communitarian notions about the meaning of the term (pp. 2-3). Communities are not mere "lifestyle enclaves" (p. 5). Instead, he asks us to consider the agrarians' idea of community as a political and social organism in the Aristotelian and classical republican

This volume is really two books in one. The first part (introduction, chaps. 1–3) is a discussion of the history of property rights and their relationship to civic republicanism. In this section Duncan attempts to create a linkage between classical (Aristotelian) and early modern (Harringtonian) visions of the linkage between property and citizenship and the vision of the agrarians. Unfortunately, the agrarians disappear from large sections of the argument, which left me with the feeling that Duncan forces the connection, relying too much upon analogy and assertion and too little upon textual evidence from the agrarians themselves.

In the second part (chaps. 4-6), Duncan takes on the central question for the agrarians, the survival of a specifically southern form of community in the face of industrialization, individualism, and advanced capitalism. He traces the forces that led to the publication of works such as *I'll Take* My Stand. This is the more effective part of the book. In these chapters the tensions that underlie the agrarians' worldview are clearly delineated. Questions of progress, industrialism, and race all receive a hearing. He asks us to understand the agrarians not as romantics nostalgic for the ante-bellum past but as rebels against the future, seeking a means to escape a seemingly preordained world of industrialism and centralized government. Duncan suggests the agrarians sought a choice between "triumphalism," or the mindless celebration of progress, and "fatalism," or the passive acceptance of the tendencies of the age and our place in it (p. 221).

This book is old-fashioned but in a good way. It sets out a forthright position. As such, and like the southern agrarians he defends, Duncan opens himself to strong criticism. His argument rests on a dangerous assumption. He seems to

believe there is (or was) a specifically southern way of life and culture that stands in opposition to challenges and demands from the rest of the country. This leads him to accept uncritically the agrarians' vision of the South and, by extension, the North. He notes that in effect this radically limits our political and social possibilities. "Once again the choices unfortunately seem to be dichotomous ones: virtue or luxury, redemption or corruption, life or death" (p. 23). Any political theory that relies on such stark choices can be suspected, with good reason, of setting up strawmen. This can be seen in the tendency of the agrarians to blame the North for the South's problems (p. 210). The North becomes the evil oppressor and the South the noble victim. As propaganda this is excellent, but as political theory it is rather weak.

A second problem is Duncan's acceptance of both moral and practical claims for the superiority of farming and a land ethic. (The southern view of the moral superiority of farming over other forms of endeavor explains why William Faulkner always listed his occupation as farmer.) But does the fact that the agrarian idea was most often espoused by academics and not by Jeffersonian yeomen suggest a disconnection with reality that undermines the main premise of agrarianism? Duncan addresses this point but in a manner that begs the question. Throughout the book, and especially in the conclusion (pp. 207-8), he compares the agrarian program as a theoretical model with the reality of industrial civilization. This is unfair, as he compares the ideal with the real. Indeed, we might ask whether building a coherent theory on which to base practice from agrarian thought is possible. As Paul Conklin notes (The Southern Agrarians, 1988), the agrarians disagreed among themselves on the proper political organization of society.

Finally, Duncan also overstates the "daring" of the agrarians in calling for a unique southern tradition and for demanding northern respect for the South. He ignores the fact that by the 1920s and 1930s the southern interpretation of the Civil War and Reconstruction had become practically the orthodox view, both in academic circles and popular culture. One need only point to such films as "Birth of a Nation" and "Gone with the Wind" as examples of the triumph of revisionism. Or consider that the use of the term "the Great Rebellion" for the war had been replaced in the North by "Civil War" or "War between the States." By the 1920s the North was quite willing to leave the South alone. Indeed, the South was seeking to become like the North through industrial development. Duncan notes this, but because he accepts the agrarians' model of a virtuous South and corrupt North, he misses an opportunity for a more complex analysis.

No discussion of the agrarians can be complete without examining their positions on race. Duncan seeks to give them the benefit of the doubt. He claims that they were segregationists but not white supremacists (pp. 210-1). Some might say this is distinction without a difference, but Duncan strongly defends its meaningfulness within their historical context. His analysis will not convince anyone who feels that that agrarians were irredeemable products of a racist culture, but it does give a sympathetic reader a means to get past race to address the more contemporarily useful parts of their argument. There is a danger in doing this, however. The danger is not that we will absolve these writers of any complicity in segregation and racism but that we will unconsciously allow them to define southern values in purely white terms. In many ways blacks are tangential to the southern agrarian project. We risk losing sight of this if we accept the agrarians solely on their own terms. We also risk losing some of the richness and tragic complexity of issues of race in the South and in the United States.

This attempt to retrieve the ideas of the southern agrarians faces a final challenge. Duncan suggests that by bringing their demands forward they faced two risks: cooptation to the northern view of industrialism and unrestrained individualism and destruction in the face of the uniformity and sameness imposed by modernity (p. 155). There is a third possibility, however, and it endangers the whole project of the agrarians and Duncan's efforts at reconstruction; this is the danger of being ignored by a triumphant opponent. Duncan's book represents an effort to avoid that third danger, to inject into our modern debates over community, globalization, and diversity the vision brought forward by the southern agrarians. As one might surmise from this review, I do not think Duncan fully succeeds in that effort, but it is surely worth making.

Anyone looking for a general introduction to the ideas and theory of the southern agrarians will be disappointed (and probably confused). But if you want to plunge headlong into a lively and idiosyncratic debate about republican virtue and sectionalism, combined with a vigorous defense of untimely men and a "road not taken," this book will provide plenty to think about and plenty to engage the emotions.

Law as Politics: Carl Schmitt's Critique of Liberalism.
Edited by David Dyzenhaus. Durham, NC: Duke University Press, 1998. 318p. \$54.95 cloth, \$18.95 paper.

Peter Breiner, State University of New York at Albany

This is an excellent collection of articles, both from German and Anglo-American commentators, on one of the most controversial and influential critics of liberalism. Focusing largely on Schmitt's critique of liberal politics and his politicization of constitutional law, the essays tend to rotate around two interrelated questions. First, should we defend the reasonableness of liberal constitutionalism against Schmitt's well-known strategy of seeking to find beneath liberal institutions the primordial "political" moment when an individual or a people willfully and without rational guidance decide to impose a unified political and constitutional order? Second, can Schmitt's existential concept of the political as the definition of the self through the definition of the enemy be used to justify political forms he would never have embraced, that is, to defend constitutional liberalism, radical democracy, or natural right? An answer to the first question (according to Ronald Beiner and David Dyzenhaus) is the explicit aim of this collection, but the provocation of these essays is in the variety of answers they give to the second question.

Quite a number of the contributors seek to explicate the relation of Schmitt's concept of the political to his critique of the liberal concept of constitutional law, especially as developed in his most significant work on public law, Verfassungslehre (1928). Ernst-Wolfgang Böckenforde's essay, which is central to the German discussion, seeks to demonstrate that Schmitt's concept of the political as the struggle of friend and enemy was meant to apply to relations outside the state. Within the state the political referred to political unity beneath which constitutionally regulated competition could occur. The essays of Renato Christi, Ingeborg Maus, and John McCormick cast doubt on this thesis. Christi demonstrates that in Verfassungslehre Schmitt adds the notion of "the people" (das Volk) as the constituent power that produces constitutions to his resolutely monarchical (and antidemocratic) concept of sovereignty. By contrast, Maus argues that despite Schmitt's decisionistic notion of popular sovereignty in his account of the Weimar constitution, "the social function" of Schmitt's theory is always to privilege the supercession of general (constitutional) law by decisionistic measures of a dictator in the state of emergency, a possibility which is always-already present in every constitutional form because all legal norms originate in the state of exception (p. 206).

McCormick provides a somewhat more nuanced account located between Maus's socially functional argument and Christi's democratic reading of Schmitt. Carefully following the concept of dictatorship from Schmitt's early work to his later Weimar writings, McCormick rather convincingly demonstrates that Schmitt abandoned his earlier endorsement of limited dictatorship in emergency situations in favor of an absolute notion of sovereignty in order to counter revolutionary socialist and communist demands for the dictatorship of the proletariat. Thus, for McCormick, Schmitt embraces popular authority as a constituent power largely as a tactical move to counter revolutionary socialism.

Space does not permit a further critical discussion of the careful scholarship behind each of these interpretations. But it is worth pointing out that a central issue at the heart of this debate is the second question, that is, whether Schmitt's inclusion under the exceptional situation of a radical democratic popular will should be regarded as a mere tactical maneuver in support of a plebiscitarian executive power or an occasion for inserting popular sovereignty into the political struggle over liberalism.

This question is indirectly taken up in a number of essays that discuss Schmitt's assault on the political institutions of modern liberalism. Ellen Kennedy points out that Schmitt's concept of "public" as the unified "people" steers between the rational liberal public and the irrational public of crowd psychology. Robert Howse argues that Leo Strauss accepted a limited version of Schmitt's decisionism in the emergency situation, but by echoing Schmitt's criticism of Weimar he also mobilized classical natural right to defend a liberalism that had abandoned the grounds for its own defense. Rheinhard Mehring claims Schmitt vastly overstates his argument that the principle of liberal parliamentarism must inevitably collapse under the weight of its tendency to compromise contradictory political positions.

Other contributors seek to defend constitutionally limited government against Schmitt's notion of the supremacy of the political decision over any constitutional system of rights. In a deftly argued essay, Heiner Bielefeldt argues that liberal neutrality toward differing world views "can quite well go along with the willingness and readiness to engage in political conflict. Liberalism, especially Kantian liberalism, is after all a fighting political ideology" (p. 31). It struggles, he claims, against oppression and discrimination in all its forms and seeks to discover biases behind universal claims. This argument meets Schmitt's challenge only half way. It does not discuss the pressures to which a radical republican form of constitutional liberalism would be subjected once forced to engage in a partisan political struggle against those who oppose the elimination of barriers to human dignity.

Mehring and Dominique Leydet simply bypass this issue. Mehring claims that Schmitt overlooks the possibility of a "constitutional patriotism" that encourages peaceful compromises in a parliamentary setting. Leydet acknowledges the force of Schmitt's criticism that liberal parliaments tend to be taken over by private interests and disciplined parties, and therefore fail to live up to the liberal principle of rational public debate in which representatives overcome their party loyalties and converge on the proposal that is supported by

the best argument. We can answer Schmitt's political-sociological critique, Leydet insists, if we simply abandon the ideal of disinterested parliamentary discussion and instead rely on the public to screen policy proposals and hold representatives accountable.

The problem with both Mehring and Leydet's responses to Schmitt is that they cede him his most trenchant political-sociological criticisms while proposing rather pale institutional alternatives to offset them. A more vigorous challenge to Schmitt comes from McCormick, who points out that Schmitt quite rightly shows that liberal constitutions have neglected the problem of who should have sovereignty in a state of emergency and that his earlier Roman model is a potential solution to the problem; but he also argues that Schmitt is wrong that the exceptional moment is at the origin of all sovereignty. The institution of emergency powers is merely a constitutional mechanism.

William Scheuerman and Jeffrey Seitzer choose a different tactic. Scheuerman meticulously demonstrates how Schmitt, and Arendt for opposing reasons, quite deliberately distorts the political doctrines of the French and American revolutions to support the view that politics is prior to and supersedes all liberal constitutional rights of liberty. Scheuerman scores an important point against Schmitt for attributing to Sieyés a purely decisionist view of the people as constitutive power while overlooking this thinker's appeal to natural law and rights of individual liberty as a restraint on any popularly representative assembly. Similarly, Seitzer shows how Schmitt justifies a plebiscitary sovereign for the Weimar constitution by tendentiously reading the history of constitutionalism as a series of decisionist founding moments.

The question these last two readings raise, however, is whether merely showing Schmitt stylized and distorted constitutional history undermines the theoretical force of his existential theory of politics and sovereignty. Surely, neither Schmitt nor Arendt is the first theorist to distort history for the sake of projecting dynamic accounts of politics into static situations or, for that matter, to view politics from the viewpoint of polarized extremes. Thinkers as diverse as Machiavelli, Weber, Mannheim, and Gramsci have done the same for goals quite at odds with those of Schmitt.

Recognizing that Schmitt's theoretical style does not entail his conclusions, Chantal Mouffe places his concept of the political in the service of a concept of radical democracy that Schmitt would have resolutely rejected. Mouffe accepts his criticism of liberal cosmopolitanism and agrees that political equality in a democracy demands at once homogeneity of citizens as citizens and the distinction between citizens and noncitizens. Yet, she cunningly argues that Schmitt gets it wrong in claiming that the tension between democracy and liberal procedure must inevitably destroy any liberal constitution. Rather, she insists the tension between citizens demanding equal rights of various kinds and liberal universalism produces beneficial consequences for a democratic polity. The rights claims of citizens offset procedural uniformity, and procedural uniformity checks the tendencies of citizens to exclude groups within society (pp. 164-5). Thus, Schmitt can be deployed to discover a democratic dynamic between his two existential poles of dictatorship and pure friend-enemy conflicts.

By redirecting Schmitt's political existentialism, Mouffe avoids a recurrent difficulty that entraps some of the other contributors who seek to defend liberal constitutionalism against his critique. The difficulty lies in Schmitt's strategy of placing liberal parliamentary politics and constitutionally limited government between the existential extremes of absolute sovereignty, on the one hand, and heightened

partisan political conflict, on the other. Once Schmitt makes this move, critics either must deny the fairly obvious fact that even constitutionally limited government shares somewhere along the way in a will-centered decisionist notion of sovereignty and that this model is part of a partisan struggle against enemies of this political form; or they must alter their political position in light of the pressures this existential condition imposes on liberal constitutionalism. Only the essays of Mouffe, McCormick, and Bielefeldt directly confront this latter problem, in part by playing off one part of Schmitt against the other.

This weakness does not override the obvious strengths of this collection. All the contributers engage directly with the substance of Schmitt's criticism of liberal politics both in its Weimar setting and in its contemporary variants. Furthermore, they do a fine job of mediating between the German and the Anglo-American idioms of political and legal theory. All in all, this collection demonstrates why theorists who do not share Schmitt's authoritarian commitments have found in his dynamic critique of liberal politics and constitutional law a recurrent challenge to their own commitments—and perhaps more important, a provocation not to reduce politics to constitutional form.

Marxism and Social Science. Edited by Andrew Gamble, David Marsh, and Tony Tant. Champaign: University of Illinois Press, 1999. 381p. \$42.50 cloth, \$19.95 paper.

Engels after Marx. Edited by Manfred B. Steger and Terrell Carver. University Park: Pennsylvania State University Press, 1999. 294p. \$55.00 cloth, \$18.95 paper.

Robert A. Gorman, University of Tennessee

Those of us who thought Marxian social inquiry unceremoniously died alongside the Soviet Union and communist Eastern Europe between 1989 and 1991 may now want to reconsider. Neoliberal optimism no longer can ignore an intensifying global and domestic maldistribution of resources. Several European nations have elected socialists to begin what promises to be a long process of reclaiming politics from corporate boardrooms. Some intellectuals—with distinct linguistic, cultural, and political identities—have survived the commercialization of universities and are standing up for decency at home and abroad. Often they organize against sweatshops, in favor of living wages, or to support unionized workers. They are also thoughtfully reflecting on the future of socialism, reevaluating socialist thinkers, and injecting the Left back into civil society. A surprising number of wellreceived new books, penned by notable socialists as well as young professors, have recently resurrected critical scholarship. Engels after Marx and Marxism and Social Science are recent additions to this expanding list of noteworthy publications. These books indicate that Marxian scholarship has ripened into a complex, subtle, engaging project that mainstream democrats may find attractive. The mindless certainty that often soiled its reputation thankfully has fallen, with communism, into history's dustbin.

Engels after Marx and Marxism and Social Science are edited anthologies. The respective editors agree that Marxism is alive and meaningfully contributing to social inquiry. They also feel Marxists no longer must agree on a set of inevitable historical laws that preclude the give and take of democratic politics. Finally, they believe that Marx himself carelessly provided the fodder for totalitarians by writing phrases that later were easily misinterpreted or taken out of context. Beyond these shared convictions, however, lie salient differences. Andrew Gamble, David Marsh, and Tony Tant,

the editors of Marxism and Social Science, equate traditional Marxism with the materialist brand of Soviet-style totalitarianism that emphasized economism and determinism. Marxism died when the Soviet empire collapsed, they argue, and is now reborn in the critical research of nonmaterialists. They would thus exclude legions of materialist scholars, including several contributors to their book, from the Left. There are no objective Marxian standards, they imply, and anyone who disagrees is categorically wrong. Perhaps this is an odd, postmodern version of democratic centralism. Manfred B. Steger and Terrell Carver, on the contrary, feel Marxism today embodies materialists and nonmaterialists. The essays in Engels after Marx thus reexamine the greatest of all materialist Marxists, Friedrich Engels, from diverse leftist perspectives. Traditional Marxism erred, Steger and Carver infer, by not tolerating intellectual diversity. There is no mevitable linkage between materialism and totalitarianism. Marxists, moreover, do not have to be materialists.

Marxism and Social Science will likely have a wide audience. The essays in Part 1 consider Marxism's relationship to methods and other perspectives in social science (e.g., feminism, regulation theory, postmodernity, New Right Theory), and those in Part 2 assess the utility of Marxism for a broad span of substantive issues, such as the state, culture, nationalism, democracy, ecology, globalization, and postcommunism. Some, of course, are better than others. Glyn Daly artfully describes postmodernism and defends its nexus with Marxism. His postmodern critique of determinism, however, is more convincing than his Marxian synthesis. He tells us how postmodernists can be Marxists, but he does not, perhaps cannot, tell us why postmodernists should be Marxists. If, as Daly asserts, cultural discourse is the only source of meaning, and discourses change, then why should the popular belief in what Daly calls "universal freedom and equality" be morally compelling? Was fascism morally correct in Europe during World War II because it was popular? Tony Tant, in "Marxism as Social Science," fares somewhat better than Daly by denying the universality of scientific models, but nonetheless he chooses Marxism over others because it generates new and better ways to satisfy what he considers irreducible human needs. Jim Johnson and David P. Dolowitz concisely summarize Marx's incomplete theory of class. Weber's critique, and recent efforts to bridge the chasm. Colin Hay situates the famous Miliband-Poulantzas debate on the role of the state in a context that includes Marx's own ideas as well as the recent work of Fred Block, Theda Skocpol, and others. His work is enjoyable and informative. Stevi Jackson's treatment of feminism, Michael Kenny's work on regulation theory, and Chris Pierson's essay on the welfare state all admirably summarize pertinent literature for interested non-Marxists.

In contrast, Andrew Gamble's project of connecting Marxism and New Right Theory seems to trivialize what each side is saying; Neil Robinson's assertion that contemporary Marxists have generally neglected the evils of Soviet and Chinese communism seems silly, given the anticommunist literature; and both John Barry's foray into "Marxism and Ecology" and Simon Bromley's essay on globalization prove that not enough has yet been written to justify the efforts. Daryl Glaser's meager discourse on "Marxism and Democracy" does not even mention Michael Harrington, certainly America's preeminent democratic Marxist.

The strength of Marxism and Social Science is also a weakness. Its targeted audience, mainstream students and scholars eager to know how Marxism relates to contemporary academic debates, does not know the resonant history of Marxism's dialectical method. This involved a change in

meaning of dialectics from economic determinism to a method stressing reciprocity of ideas and matter, culture and economics. The cultural studies in *Marxism and Social Science* were portended by Marxian thinkers for years and demonstrate the interpretive, nondogmatic, totalizing qualities dialecticians prefer. Without this theoretical and historical context, which the editors have omitted, Marxism becomes quicksilver: always changing, stretching everywhere.

Engels after Marx moves us closer to this context by reexamining the putative founder of dialectical materialism, Friedrich Engels. Organized into two sections—one dealing with Engels's philosophy and theory, the other with practical politics and social science—the book will beckon those with an informed opinion about Engels's connections to both Marx and modern communism.

The best essays in *Engels after Marx* are provocative and educational. The worst are very bad. Among the latter are several that examine whose authorial voice wins in the Marx-Engels partnership. Turgid, self-indulgent, and possibly vacuous, these narratives aroused repressed memories of my own youthful trials with a journal called *Telos*.

In contrast, Peter T. Manicas's "Engels's Philosophy of Science" refreshingly whitewashes the standard critique of Engels's Hegelian metaphysics and its inherent totalitarianism. In "Engels and the Enlightenment Reading of Marx," Scott Meikle argues that Marx's Aristotelianism, his belief that critical science must serve an ethical purpose, was fundamentally different from Engels's Enlightenment scientism. Engels eventually succeeded in tying Marx to the very bourgeois concerns and commitments he wanted to end. Manicas and Meikle are very convincing. Their message is reiterated by Tom Rockmore, who employs a vaguely postmodernist tack, and Paul Thomas, who focuses on methods. But Marxism today is unpredictable and heterogeneous. S. H. Rigby's "Engels after Marx History" documents how both Marx and Engels at different stages of their lives articulated humanistic, dialectical, and metaphysical epistemologies and may have believed all three simultaneously. So if Engels is dangerous and mistaken, then Marx is as well. Western Marxists usually attribute Marx's philosophical meanders to naivete and Engels's scientism to a lifelong passion. Rigby's research goads us to think again. Douglas Kellner may have taken this strategy over the edge. His "Engels, Modernity, and Classical Social Theory" contends that the early Engels theorized the distinctive features of the modern world and inspired Marx's critical theory of capitalism. The pupil, for Kellner, actually taught and inspired the master.

These Engelsian conundrums are left behind by Manfred B. Steger and Lawrence Wilde, who are more interested in how Engels was influenced by German politics after 1883. Steger's "Friedrich Engels and the Origins of German Revisionism: Another Look" argues that Engels realistically revised his views on violence, electoral politics, and nationalism (the sole theme of Michael Forman's essay) as a temporary revolutionary tactic. Paradoxically, he inspired Eduard Bernstein to reformulate Marxian theory to better suit the new reformism. Engels, says Steger, was actually the father of Marxian revisionism. Wilde, in "Engels and the Contradictions of Revolutionary Strategy," feels that Engels's tactics created tensions that mangled the international socialist movement. The book concludes with two non sequiturs: Carol Gould's feminist take on Engels's The Origin of the Family, Private Property, and the State, and James Farr's "Engels, Dewey, and the Reception of Marxism in America," which explores the absorbing relationship between John Dewey and Sidney Hook as they both seek to understand Marx, Engels, and the meaning of scientific socialism. Dewey,

Hook notwithstanding, accepted only Engels's Marxism and, through Dewey's influence, so did the United States.

Engles after Marx reflectively revisits the past. Marxism and Social Science modestly interprets everyday life. They help dispatch Marxism into the twenty-first century purged of hubris, filled with hope, and committed to democracy, diversity, and dialectics.

Freedom of Association. Edited by Amy Gutmann. Princeton, NJ: Princeton University Press, 1998. 382p. \$77.50 cloth, \$20.95 paper.

William A. Galston, University of Maryland

The morning I began writing this review, the Supreme Court issued its long-awaited decision in Boy Scouts of America v. Dale. James Dale, an Eagle Scout and assistant scoutmaster, had his membership revoked when the Boy Scouts learned that he was gay. (A New Jersey newspaper had reported that he was copresident of the Rutgers gay and lesbian student organization.) Dale brought suit under a New Jersey law that bans discrimination based on sexual orientation in public accommodations. A narrow majority of the Court found that the New Jersey statute violated the Boy Scouts' First Amendment right of "expressive association," that is, its right to organize around the articulation of its preferred core values and to select members and leaders consistent with those values.

Boy Scouts v. Dale was decided against a complex threefold background of contested issues: a constitutional debate about the often competing claims of associational liberty and individual equality; a normative/theoretical debate about the nature of civil society and its relation to liberal democracy; and an empirical debate sparked by Robert Putnam about changing patterns of associational life in the United States and the probable effects of these shifts. The articles in Freedom of Association help frame the broader constitutional and normative/theoretical issues and suggest considerations that empirical researchers would be well advised to consider.

In parallel critical examinations of the leading Court decision in this area (Roberts v. United States Jaycees), George Kateb and Nancy Rosenblum offer spirited defenses of conceptions of freedom of association broad enough to support the majority opinion in Boy Scouts v. Dale. In her penetrating introduction, Amy Gutmann points out that freedom of association is not a constitutional absolute and that hard questions arise when it clashes with other core constitutional principles. She observes that it is not always clear when an association is "expressive" or should be regarded as a "public accommodation." In a detailed examination of issues and cases, Kent Greenawalt argues that constitutional claims based on religious association are often stronger than are other sorts of expressive associational claims, and this differential treatment is "reasonably defensible" from a wider normative point of view (pp. 137-8). Peter de Marneffe agrees, but with a qualification: It would be morally wrong for a government to compel the Catholic Church to ordain women as priests in violation of canon law and conscience, but it would not be wrong to override "uncodified local tradition" (p. 156). More broadly, he argues, there is no correct general account of associational rights; from a moral as well as constitutional standpoint, there is no alternative to a case-by-case approach that weighs the competing interests and arguments at play in specific controversies.

The remainder of the essays in this volume place associational life within a civic frame. Although much of the discussion of associational liberty revolves around "voluntary" associations, Michael Walzer argues that involuntary associations are inevitable and (within certain limits) a good thing. Freedom, he claims, requires nothing more than the possibility of breaking involuntary bonds, and the individual's ability to do so can only be cultivated within groups and institutions in which membership is unchosen. Will Kymlicka discusses the tension between a key form of involuntary association-groups based on shared ethnicity-and the characteristic efforts of nation-states (including liberal democracies) to forge what he calls a "common societal culture" (p. 182). Broadening this analysis, Yael Tamir points out that associational life in free societies does not always support liberal democratic norms and practices. Nonetheless, she argues, the state must be very cautious about intervening in civil society; it must act to assure that all individuals have meaningful rights to associate and to leave associations, but it should not overestimate its ability to intervene productively in the internal life of civil associations. Approaching this tension from a communitarian standpoint, Daniel Bell suggests that if liberal democracy requires a distinctive form of civil virtue, it is likely that some civil associations will impede rather than foster its development, and public programs and institutions will be needed to counteract the centrifugal forces of civil society. Samuel Fleischacker argues that "insignificant communities"—groups that lack a compelling higher order purpose (such as individuals gathered at public squares and bars)—are more compatible with liberal democracy than are more comprehensive and demanding associations. Alan Ryan suggests that modern cities are sites for distinctive and valuable patterns of free association, and Stuart White argues that modern liberal democracies have good reasons to promote trade unions as distinctively valuable forms of free association.

Not every reader will be interested in every essay, but each is written at a high level of clarity, rigor, and relevance to problems that matter. Comparable collections were published more than thirty years ago, and much has changed in scholarship and in the world since then, so this volume helps fill a substantial void in the literature. Indeed, it is clearly the best introduction to issues raised by freedom of association in modern liberal democracies. It helps us understand why Alexis de Tocqueville is so much the man of the hour, and why fashionable neo-Tocquevillean enthusiasms must be tempered by uncomfortable economic, political, and even psychological facts. Voluntary groups are the source of much that is valuable, but they are not a silver-bullet cure for the characteristic ills of modern liberal democracy, and some of their practices are bound to trouble even dedicated defenders of free association who also care about the equal dignity of every citizen.

The Feminist Standpoint Revisited and Other Essays. By Nancy C. M. Hartsock. Boulder, CO: Westview, 1998. 262p. \$18.00 paper.

Mary Caputi, California State University, Long Beach

This collection by Nancy Hartsock traces the increasing theoretical sophistication of a leading American feminist scholar. The breadth, seriousness, and occasionally anecdotal style of these pieces make for engaging and often humorous reading on a wide range of topics. These include definitions of political power, Marxist and revisionist Marxist theories, the relevance of structural anthropology to gender, and postmodernism's rethinking of language, subjectivity, and power. The book does more than simply demonstrate how

the thoughts and feelings of Hartsock herself have evolved over time, however. To a good degree, it also operates as a touchstone for the debates within feminist theory as a whole, charting the direction taken by the field in the United States over roughly twenty years. It is for this reason that the book serves the needs of both research and teaching, for in many ways it demonstrates how feminist thought has evolved.

The earlier essays, composed largely in the 1970s, recall the effort to ground and explain the theoretical importance of sex and gender. They defend the need to study systematically a crucial axis of power that for so long had been invisible to many (as indeed it still is in certain circles), obscured by gender's "naturalness," which ostensibly flows into and structures the social sphere. Hartsock thus defends the position that the personal is political—a staple of second wave feminism—and exposes gender inequalities so often dismissed as unavoidable, unchangeable, and at bottom unproblematic.

Also, these early essays do not address themselves to an exclusively conservative readership but enter into conversations on the Left. Both "Fundamental Feminism: Process and Perspective" and "Staying Alive" seek to expose the abiding blind spots that many leftist scholars and activists still have when it comes to traditional gender hierarchies. Such masculmist premises as the abstract individual, the separation of mind and body, and the discrete spheres of public and private life preclude what Hartsock terms "the male left" from recognizing its own ingrained sexist practices and reactionary mind set. This has allowed the Left to dismiss feminism as little more than a distraction from the more pressing topic of economic relations. "The implication of this . . . is that (feminist) concerns are special interests and are fundamentally irrelevant to the real questions raised by monopoly capital' (pp. 34-5). Thanks to her criticism of such ingrained blindnesses, Hartsock is to be counted among those pioneering scholars who initially articulated a feminist critique of the Left, exposing a reactionary drift in circles otherwise thought of as progressive.

The later contributions from the 1980s and 1990s reflect the movement's inroads into the halls of academe and into American culture at large. Entering into conversations that are ongoing in feminism, they engage the work of other feminist scholars who have significantly influenced the discipline: Gayle Rubin, Nancy Chodorow, Adrienne Rich, several postmodern scholars, and others. They offer Hartsock's response to such crucial topics as the structuralism of Claude Lévi-Strauss; the incorporation of psychoanalysis into feminist thought; Foucault's reading of the location and workings of power, the intersections of gender, class, and race; the pervasiveness of compulsory heterosexuality; and the abiding usefulness of Marxian categories to feminism. Indeed, Hartsock covers nearly all the central concerns of contemporary feminism (with the exception, perhaps, of French feminist thought). It is, of course, the question of Marxian categories that is at the heart of her most famous contribution to the field. This argument in favor of feminism's reoccupying of Marxist terrain is developed in The Feminist Standpoint: Developing the Ground for a Specifically Feminist Historical Materialism." It explains Hartsock's epistemological methodology, which, in its synthesis of feminism and materialism, most encapsulates all that she holds dear.

Hartsock insists that certain components of Marxian theory are indeed valuable to feminist scholarship, and her obvious disdain for market ideology keeps her from mincing words on this point. "It is often claimed," she writes, "that the market can act as a school for democracy and a tool for encouraging democracy. I, however, see the market as a

mechanism for increasing inequality both globally and locally" (p. 7). Following the lead of both Marx and George Lukács (the concept of a standpoint is itself Lukácsian), her analysis privileges labor and production over the market's system of exchange and identifies work as the key contributor to epistemological questions. Hartsock thus embraces the materialist precept that "work produces both our material existence and our consciousness" (p. 47).

Such a theoretical commitment to the connection between labor and epistemology subsequently focuses on the sexual division of labor, on how women toil, and on how "work" is defined. Examining the gendered nature of production raises a battery of thorny and often emotional issues so crucial to bourgeois ideology. To scrutinize the sexual division of labor not only asks questions about the organization of the work week, the sexual politics of the workplace, and equal pay but also examines the structure and dynamics of the family, the politics of child rearing and housework, and the exhausting nature of the "double shift." Feminist standpoint theory takes seriously the necessary care taking that goes into shopping, cooking, cleaning, chauffeuring, and after-school activitiescare taking that need not be performed solely by women. It highlights the fact that, traditionally, "only some of the goods women produce are commodities" (p. 114), yet Western women live in societies whose organizing economic principle is the production and exchange of commodities. All this, of course, results in a general undervaluing of so much of women's labor, in an elision of their toil, when in fact "women as a group work more than men" (p. 114).

The concluding essay allows Hartsock to revise what she later came to view as a shortcoming in standpoint theory. This was her insufficient attention to differences among women, her tendency to oversimplify things with little regard for class, race, and other crucial axes of domination. Her revision is a welcome one, for such axes must come into play if a reading of power and epistemology is to be viable. Once modified by this corrective measure, Hartsock's argument surely finds a place at the forefront of the discipline, for her careful synthesis of materialist philosophy, feminism, and difference constitutes a seminal contribution to the field. Indeed, standpoint theory has become a staple in feminist scholarship, an integral part of the field's literature, conferences, reading lists, syllabi, and general discourse. But the author's ambition is not merely to influence the discipline's discourse, to add to its verbiage in deference to the thralldom of language. Mindful of the Marxian heritage that she so respects, Hartsock instead offers a way of changing the world, of altering its institutions and practices in fundamental ways, because "what we mean by political change is structural change" (p. 29).

Early Modern Concepts for a Late Modern World: Althusius on Community and Federalism. By Thomas O. Hueglin. Waterloo, Ontario: Wilfrid Laurier University Press, 1999. 280p. \$39.95.

Elisabeth Ellis, Texas A&M University

Johannes Althusius (1557–1638) spent his life defending the prerogatives of small political entities against the encroachments of large political entities. As the syndic of the seaport town of Emden, Althusius waged a daring campaign of disobedience toward the local would-be absolutist territorial ruler, the count of Eastern Frisia, and even put the count under house arrest at one point. Althusius's writings on politics, including his classic *Politica* (1603), oppose the centralized sovereignty that came to characterize the national

state, championing instead the autonomy of plural communities, such as guilds and towns, and a federal, consensus-based politics governing their relations. Althusius died ten years before the Treaty of Westphalia (1648), which formalized the system of sovereign national states that he had devoted a lifetime of writing and political activity to prevent. His political thought, based as it is on a society of estates that has not existed for hundreds of years, might well have gone to oblivion with the Standestaat. As Thomas Hueglin ably explains, however, Althusius's work is actually quite relevant to our world of declining national sovereignty, globalization, and increasing interest in politics on the subnational and transnational levels.

Hueglin aims to establish Althusius as an important theorist of politics by reconstructing his system and then arguing for its relevance. The author rightly insists that the reader pay attention to the political and rhetorical contexts of Althusius's writings, demonstrating nicely how "a decontextualized Althusius can be put to the service of all kinds of ideological agendas" (p. 23). Hueglin leads the reader through the history of Althusius interpretation, summarizing and evaluating scholarship from Otto von Gierke, Althusius's modern "rediscoverer," through Carl J. Friedrich and on to Hueglin's very few contemporaries (including especially Anthony Black, Guilds and Civil Society in European Political Thought from the Twelfth Century to the Present, 1984). Next Hueglin presents a reconstruction of the Althusian political system, topic by topic, with issues of contemporary relevance included as they come up.

The advantage of this mode of presentation is that Hueglin largely succeeds in demonstrating the relevance of such Althusian concepts as consociation, federalism, and consensus-based, nonmajoritarian governance. With regard to consociation, for example, Hueglin not only points out the connection, via David Apter, to Arend Lijphart's work but also draws a connection between Althusius's very general concept of consociation as mutual communication and the contemporary debate on the modern distinction between the public and private spheres (chaps. 7 and 12). In five expository chapters (chaps. 7-11) and a concluding chapter (chap. 12), Hueglin discusses an impressively broad array of political theories as they relate to his subject. Althusius's early modern community-based federalism is compared to current theories of federalism, social contract, civil society, democracy, liberalism, socialism, globalization, citizenship, international relations, and even personal identity. Although discussion is frustratingly thin at times (e.g., Hueglin attributes to Kant the view that theory does not necessarily apply to practice [p. 37]), the author's vast knowledge of contemporary political theory serves his purpose well, as Hueglin can demonstrate at least "affinities" if not "lineage" (chap. 12) between Althusius and the present day.

There is a disadvantage to Hueglin's choice of argumentative style, however. By focusing on the reconstruction and application of Althusius's theory, Hueglin reserves his critique for Althusius's interpreters and fellow political theorists. He never presses Althusius for answers to the difficult questions, such as those posed from a liberal standpoint. Althusius opposes absolutism and supports plural federalism in the name of community rights, not individual rights. If political authority comes from the nonmajoritarian consent of a collection of independently legitimate communities, as Althusius argues, one might well ask about determination of membership, or about protection of minorities within these minorities, or about the effectiveness of any governing body that requires unanimity for its decisions. Hueglin has no time for sustained consideration of these and other "big ques-

tions" in this book, which sometimes seems to be more about vindicating interest in Althusius than about vindicating his theory.

The book gives us access to an interesting point of view by asking us to consider politics beyond Bodin's and Hobbes's presumptions about sovereignty and the state. Politics in Althusius's system is plural, in that institutions are organized without recourse to any universalist arbiter of the right. Authority is divided both horizontally and vertically, and power is kept close to fairly small units of society. Large-scale decisions are made on the basis of consensus, and some group rights are respected. Against any theory that would locate power in a central authority, Althusius posits a decentered, community-based system of governance. Hueglin cites the European Union, federally organized states such as Canada, globalization, and multiple overlapping citizenships, among other phenomena, and he concludes that today's political reality requires a new theory appropriate to its conditions. He offers a well-documented, exhaustively researched reconstruction of Althusius's political thought to fill that void.

Postmodernism Rightly Understood: The Return to Realism in American Thought. By Peter Augustine Lawler. Lanham, MD: Rowman & Littlefield, 1999. 193p. \$60.00 cloth, \$19.95 paper.

Thomas L. Pangle, University of Toronto

This deeply serious and richly thought-provoking book opposes a "postmodernism rightly understood" to "postmodernism as it is usually understood." The latter, as "antifoundationalism, the assertion of the groundlessness of human existence, is really hypermodernism, or the exaggeration to the point of caricature of the modern impulse to self-creation." The former is the return to "Thomistic" or even "Socratic" rationalism, according to which "human reason exists primarily not to transform reality but to understand and to come to terms with it" (pp. 1–2).

More precisely, "realistic" postmodern thought recapitulates a Pascalian analysis of the human condition as defined by "the greatness and the misery of self-conscious mortality" (p. 5). Humanity's confrontation with the inescapable abyss of death necessarily engenders a pervasive sense of alienation that spurs the soul either to desperate escapism in manifold forms or to a quest for nonutilitarian freedom, love (eros), virtue, and wisdom that can find complete fulfillment only in the biblical God. At the core of the modern project, in contrast, is the pragmatic and therapeutic hope that rational manipulation of the environment and of the psyche can end all profound human suffering and thereby reveal humans as nothing more than very clever, historically malleable, and ultimately satisfiable animals whom death in itself does not deeply move. Therefore, they can be liberated from delusory transcendent longings that were artificially constructed in and by history.

The first chapter ascends from what Lawler regards as Fukuyama's equivocating presentation of Kojève's thesis on the "end of history" to the genuine article, in its ruthless consistency. Fukuyama proclaims the emerging global and permanent victory of prosperous, healthy, humane liberalism as the dawn of Kojève's "universal and homogenous" society—while incoherently attempting to assert that within this order there will persist scope for human dignity and achievement. Kojève sees that the realization of this ideal, since it

entails the eradication of suffering and principled conflict, leaves no challenge for transformative work or moral action, or even, ultimately, for passionate inquiry.

Even though Lawler remarks that, among other things, this "shows that the Christian conception of the eternal, or infinite, Creator is incoherent" (p. 34), he does not, to my disappointment, respond with any attempt at a refutation. Instead, he descends in the second chapter to a somewhat diffuse refutation of Rorty, the most telling point in which I discern to be the following. Rorty proclaims the impending victory of his view that "a merely material and secular goal suffices: mortal life as it might be lived in the sunlit uplands of global democracy and abundance" (cited on p. 48). But in stark contrast to the Hegelian Kojève, Rorty denies that this view can claim to be true, or even that his favored emerging society is "more natural or more rational than the cruel societies" of the past (p. 57), for the truth is the contingency and lack of objectivity of all such ultimately groundless "choices."

But what is the ground of this Truth? Most acutely, what experiences or facts speak against the greater rationality or truth of at least the "sufficiency" of universal solidarity and prosperity? The clearest answer is Rorty's recognition of another Truth, an insuperable dilemma of human nature that Rorty criticizes Marxists for ignoring: "the price we pay" (Rorty writes) is "the culture that put Socrates to death," dominated by the "bland, calculating, petty, and unheroic"; a culture where "we, the people who value self consciousness, may be irrelevant to the fate of humanity" (pp. 54-5). But then Rorty himself testifies to the unsatisfied or unsatisfiable spiritual longings that block full acceptance of pragmatism's goal as truly sufficient for self-conscious human nature:. Rorty's "posthistorical wisdom contradicts his own existence as a philosopher" (p. 59). Rorty tries to obscure but in fact spotlights the fundamental difficulty by retreating into "irony," and Kojève may similarly betray or call into question his thought by his comparable "irony" (pp. 60-1).

The curious twist is that the chapter on Rorty has as its most serious goal an attempted refutation of the more profound Allan Bloom, as the exemplar of the supposed inherent weakness of intransigently classical (unPascalian) Socratic rationalism. Bloom is portrayed as an unaware witness for Rorty, inasmuch as Bloom's Socratism compels him to describe contemporary students as satisfied in soullessness, which implies that all humanity except the "idiosyncratic" philosopher is naturally incapable, absent historical artifice, of responding to mortality with erotic passion: Bloom's Socratic message is that the "flat soul is the true soul" (p. 69). Not only does this amputate Bloom's moving accounts of the numerous students whose eros he has seen electrified by the redemptive great books, but also Lawler proceeds to contradict himself. In an awkward "Afterword" he is compelled to concede that actually Bloom spotlighted the "boundless" anguish of children of divorce as the "theme of reflection and study." Bloom called them "the symbols of our time" because he saw "their disarray in the cosmos" as only the "extreme form" of what he called our all-encompassing "spiritual vortex set in motion by loss of contact with other human beings and with the natural world" (p. 72).

The unsuccessful attempt to dispose of Bloom is meant to remove the competition from what Lawler so compellingly elaborates and explores in the subsequent, constructive chapters: the Christian writings of Walker Percy, bolstered by the Augustinian sociological class analysis of Christopher Lasch. Here, Lawler contends, we find the authentic, because Thomistic, rationalism, which shows that reason finds its fulfill-

ment, without truncation, in Christian faith and which proves that only reason so conceived can adequately comprehend humanity as constituted by self-conscious erotic mortality. But in fact Lawler has to show that Percy abandons Thomas's core Aristotelian teleology in the name of a farrago comprising the "tradition of Anglo-Saxon empiricism" (p. 84), a tendentious shot-gun marriage of creationism and Darwinism (pp. 88–9), and a Heideggerian "experience" of the human as "alien" in "a cosmos that is otherwise dyadic" or "stimulus-response" (p. 80).

What Percy calls his "Thomistic science" is, Lawler admits, in truth "a combination of Pierce's semiotic empiricism and Heidegger's [atheistic] existentialism" (p. 97). It is then not surprising that although lip service is paid to "natural law," no attempt is made (in the manner of authentic Thomists such as Vitoria, Suarez, or Pieper) to give the much needed argumentative defense of that core Thomistic doctrine. Above all, Thomas's moral grounding in Aristotle's Politics and Ethics, culminating in the peak of aristocratic greatness of soul as the foreshadowing of the contemplative life understood as the only intelligibly divine life, as the life whose acknowledged supremacy ought to be the beacon of inspiration for every rational human soul, shrinks almost out of sight. With all this subtracted, what is left of Thomas's argument for Christianity as the completion of Aristotelian (the only integral) rationalism?

Lawler's illuminating introduction to Percy as a truly weighty thinker for our time would grow in strength through a franker acknowledgment of the problematic gulf between Percy and genuine Thomism, then through a fairer and less evasive dialogue with the challenging alternative conception of divinity and of humanity found in classical, Socratic-Aristotelian rationalism.

Acting in Concert: Music, Community, and Political Action. By Mark Mattern. New Brunswick, NJ: Rutgers University Press, 1998. 240p. \$50.00 cloth, \$20.00 paper.

William Chaloupka, University of Montana

Political scientists have long been ambivalent about including some particular cultural and social modes of action into their standard inventory of political acts. Street demonstrations, crvil disobedience, and popular culture, to name a few, have been slow to capture their attention, despite wide popularity among advocates for such expressive vehicles. There are good reasons for this reluctance. Such forms are difficult to assess; their importance often remains a matter for speculation; and the range of interpretations can be broad. But whatever the reasons, it is clearly the case that other academic fields have gone farther than political science in studying some of the less mainstream modes of political expression and action.

Acting in Concent attempts to deal with one form of cultural activity—popular music—in a way that is distinctively within the realm of political science. Rather than adopt available models in cultural studies or ethnography, to cite two predecessors, Mattern studies music as if it were a field of public action that a political scientist would observe and analyze. Within the overall project of showing that music can have political implications and can be studied in this manner, the primary innovation is Mattern's suggestion of a taxonomy for popular music's political functions. In a community context, music can adopt different strategies for community-based

political action. Mattern (p. 25) introduces three categories: the confrontational, deliberative, and pragmatic.

The book examines at length three cases that illustrate these categories and also develops the argument that music indeed plays a significant political role. The three cases are oppositional music in Chile (from the 1960s through the 1980s, focusing on events surrounding the Allende government's rise and fall), among the Cajun community in Louisiana (in this century, focusing on the revival in the 1970s through the 1990s), and in Native American communities in the upper Midwest (in the 1980s and 1990s). In each case, Mattern reviews the political context from which the music emerges and then describes the music in terms of its origin, instrumentation, aesthetic qualities, and lyrical content or performance format. In the introduction and first two chapters, Mattern reviews the relevant political science literature and connects his argument to theories about the formation of community, primarily those of the American philosopher John Dewey.

Of the three, the Chilean case provides the clearest example of protest music sung in conjunction with dramatic political and social conflict. Deprived of access to other forms of mass communication, groups aligned with workers, the poor, and indigenous communities promoted their cause through songs that were clearly confrontational in lyncal content and performance format. Of all the examples in the book, Mattern (p. 38) is most critical of the "new song" movement's approach: "Although it is not surprising that musicians relied heavily on confrontational strategies, it was nevertheless unfortunate." He also criticizes the hypocrisy of educated and elite musicians who adopt the music of oppressed peoples to promote political ends (pp. 45–6).

The Cajun case provides elements of both the pragmatic and deliberative modes. The revival that began in the 1970s helped focus cultural identity, which served a pragmatic function. In the deliberative mode, the discussion around music provided a forum in which Cajuns could debate such crucial topics as assimilation and progress. But the Cajun case also includes a negative example. Although black and white musicians in southwestern Louisiana obviously interact and learn from one another, music has not played a significant role in bringing racially mixed audiences or communities together. There are limits to the community-building powers of music.

The Native American case likewise illustrates both the pragmatic and deliberative modes. Although Mattern finds little that is confrontational in the powwows he studies, he acknowledges that music plays a confrontational role elsewhere in Native American communities. Perhaps the best example of a deliberative function for music is found in his description of the ongoing debate over the secular-sacred split, which can persist even during powwow drumming and dancing, in the actions and announcements of participants.

Acting in Concert is a short book (146 pages of text). Given the task of providing contextual information for three diverse cases, as well as articulating the three categories, Mattern must necessarily take the role of provocateur. There is much to debate in these cases, and some exclusions can be questioned. Is it fair to criticize the Chilean rebels, who faced such difficult circumstances? Does it make a difference that both the Cajun and Native American cases discuss cultural revivals that parallel the development of identity politics in the United States? Several widely debated instances of cultural politics receive the barest mention, including rap music and the role of music in the 1960s counterculture. The use of culture as a target for resentment politics likewise receives little discussion, which might suggest that Mattern's persis-

tent focus on the intentions and functions of music could miss other important and relevant political events. In sum, Mattern provokes debates more than he resolves them.

The political role of music is a topic that could benefit from an interdisciplinary approach. Sociologists, art historians, anthropologists, literary theorists, students of social movements, and cultural studies scholars all have something to add to this discussion, beyond the scope of this brief study. After all, fostering community identity, a function that Mattern raises frequently, is as much a social and aesthetic event as a political one. There is little reason to draw disciplinary lines too severely, especially once a political science starting point has been established. By emphasizing function and intention, Mattern brings a thoughtful approach to a topic that contains potential for controversy and dispute. This is a reasonable place to start, not the least because it promises so many openings for further work.

Ruling Passion: The Erotics of Statecraft in Platonic Political Philosophy. By Waller R. Newell. Lanham/Boulder/New York/Oxford: Rowman & Littlefield, 2000. 205p. \$70.00 cloth, \$24.95 paper.

Stanley Rosen, Boston University

This extremely interesting book contains a subtle and finely detailed reflection on one of the main problems in Plato: the relation between eros and thumos (spiritedness). The text is dense but not obscure. On the contrary, it makes a multiplicity of observations that are at once original and yet so plausible that one is tempted to ask at countless points in the argument: "How could it have been otherwise"? At the same time, Newell's treatment of the problem is faithful to the dialectical presentation in the dialogues, which is to say, in praise of Newell, not criticism, that it could indeed have been otherwise. Even more fundamentally, one is driven to ask. What was Plato's view if not that he himself explains to us why it will very likely be otherwise?

Newell asks us to consider how the Platonic Socrates tries to rescue us from the tragic consequences of "primordial ontology" (Newell's phrase for pre-Socratic cosmology), an ontology that provides no basis for attributing significance to human life. Newell argues by way of close analyses of relevant parts of the *Gorgias*, *Symposium*, and *Republic* that Socrates proceeds in three main stages. In the *Gorgias*, he attempts to convince Callicles and others who are politically ambitious that their "longings for both honor and pleasure will ultimately be better fulfilled by civic virtue than by tyranny" (p. 2). This in turn depends upon the submission of the spirited part of the soul to an education in civic virtue. "Socrates hoped to engage Callicles' love of victory, but this is just what makes Callicles unreachable by dialectic" (p. 20).

In the Symposium, Socrates identifies himself with the thesis of Diotima that there is a continuous erotic ascent that takes us up the ladder via politics to philosophy; in slightly different terms, the philosophical erotics as practiced by Socrates provides us with both egoistic or self-perfecting pleasure as well as the spirit of philanthropy (pp. 63, 71). At the same time, there is a tension within eros between the desire for mastery (represented by Callicles and Alcibiades) and the desire to transcend the human condition in the view of the ideas (p. 82). The apparently seamless web of the erotic ascent already reflects a deeper version of the conflict between thumos and eros, namely, a dualism within eros itself. Socrates not only must reconcile thumos to philosoph-

ical eros but also must protect the philosophical component of eros from its root in the lower desires.

This brings us to the *Republic*, about which Newell argues that thumos can be educated to be both civic-spirited and in a way philosophical (p. 103). Newell's analysis of the nature of thumos is one of the highlights of his book, and it would be impossible to do justice to it in a short review. I can mention only the heart of the matter. Socrates separates thumos from the dangerous force of eros and makes it the key part of the soul for the political education of the auxiliary class in the beautiful city (pp. 63, 92). He does this by assuming that thumos can "see," that is, its perception of the difference between friends and enemies is capable of development into civic virtue by the proper education, and this is in a way philosophical (pp. 79f, 147).

In this section of the *Republic*, eros is suppressed; liberated from eros, thumos is made gentler and capable of political rule or civic virtue (pp. 116f, 139). But it returns, as it must, in the discussion of the philosophical nature, and here the problematic status of the relation between eros and thumos springs up with full clarity. To mention only the most important point, thumos, which is marked by "correct opinion," becomes dissatisfied with its subordination to philosophical eros; indeed, the skepticism of the latter toward the former serves to exacerbate the rebelliousness of thumos and thus leads to the overthrow of the city (pp. 144, 157, 169). Throughout the second half of his study, Newell is especially sensitive to the question whether philosophy can be made truly compatible with politics or civic virtue. He is eloquent on the harmful effect of the former on the latter, but at the same time he is hopeful that Socrates' philosophical erotics may be able to reestablish our vision of the unity of the soul (see, in particular, the remark about Glaucon on p. 180, together with p. 94).

This summary at least indicates the richness of Newell's book. I must add that there are sections of unusual brilliance devoted to the character and pertinence of Callicles to each of the three main dialogues studied by Newell, and there is an unusually brilliant commentary on the Leontius passage in the *Republic*. I had some reservations about a number of points in the main argument, of which perhaps the most serious is with respect to what Newell calls philosophical erotics. In a typical passage, Newell claims that "the investigation of civic virtue is the subject matter of philosophical erotics" (p. 179). This seems too restrictive, in view of Newell's own repeated perception that the highest form of eros is for the so-called Platonic ideas or, as he puts it, transcendence.

Newell has accomplished so much that it would be churlish to ask for more, but I suspect that, if he had dealt with *Phaedrus*, his portrait of eros would have been enriched. Otherwise put, Newell deals with the political context of eros—that is his privilege and his central theme—but as a result, we see only one side of the complex portrait of philosophy in the Platonic dialogues. Socrates is only a part of that portrait; other parts lead to the question of the status of eros in philosophy; for that matter, there is evidence in Alcibiades' speech in the *Symposium* that Socrates was not the lover of human beings he claimed to be. But this is almost beside the point; we have here one of the best books on Plato to have appeared in a number of years, and part of its excellence is that it draws us into the dialectic.

The Dominion of Voice: Riot, Reason, and Romance in Antebellum Politics. By Kimberly K. Smith. Lawrence: University Press of Kansas, 1999. 320p. \$40.00.

Mark Reinhardt, Williams College

Through this learned and imaginative theoretical excursion into American political history, Kimberly Smith issues a challenge to deliberative democrats and their fellow travelers. The book is a genealogy of the connection between democracy and rational debate: The goal is to make that connection more contestable in the present by revealing its historical contingency. In Smith's telling, early advocates of the politics of deliberation used conceptions of rationality, persuasion, and force in a way that impoverished the democratic repertoire. Yet, contemporary thinkers have unwittingly inherited and naturalized these-aporetic or untenable—terms. Democratic theory thus often employs ideals of political reason that cannot come to terms with "the positive role that interest, passion, compassion, and even violence might play in the political life of the nation" (p. 8). Upon recognizing these limitations, and the ways some antebellum insurgents overcame them, we will view rational deliberation not as the proper medium of our political life but merely as one among many democratic possibilities (p. 242).

Smith begins with an analysis of the contentious eighteenth-century discourse about riots. Before the Revolution, critics saw mob action as a deplorable breakdown of deference and order, whereas defenders legitimated it as a kind of purposeful and orderly disobedience, but both sides agreed that riots were acts of political resistance by the democratic element or "the people." Smith shows how the founders. especially Federalists, transformed this interpretive framework by presenting rioting as the triumph of uncontrolled "passion" over rational argument and, as such, an attack on the foundation of the republic, the people's capacity for self-rule. Smith's key point is that this ideal of argument was not cause but artifact of the Federalists'-independently motivated rejection of popular turbulence and insurgency. Reconceptualizing riots was crucial to their decisive redefinition of politics (p. 49).

Subsequent chapters follow the checkered career of the norm of rational politics, beginning with antebellum critiques that placed mob action still farther outside the boundaries of the political and proceeding to the contending conceptions of public debate and deliberation that grew from those critiques. Neoclassical advocates of the art of rhetoric could account for the power of political speech to move popular audiences, but only in a way that fueled fears of demagoguery: Critics maintained that a politics of eloquence would erode rationality, equality, and citizen independence. Enlightenment advocates of a more rationalist model of public discourse honored those threatened values but at the cost of rendering politics impossibly sterile; their strictures on deliberation left no room for existing means of or motives for political mobilization.

Of course, as Smith adds, elite advocates of an enlightened politics usually wanted not to motivate but to curtail popular activity (p. 149). In the concluding chapters, on abolitionism, she argues that mobilization against dominant institutions required opposition to prevailing epistemological premises and rhetorical models. This subtle argument correctly emphasizes the centrality of pathos and sympathy to abolitionist rhetoric but recognizes that slavery's opponents often invoked moral and cognitive universals. Smith captures this complexity in an astute analysis of slave narratives as "romances about the enlightening power of political reason" (p. 166). Both the reason and the romance matter. Abolitionists

saw slavery as infecting the whole of people's moral nature, corrupting both thought and feeling. Smith shows that this corruption could be confronted only through an ambitious "politics of storytelling," a politics that, like earlier forms of street protest, fell outside the boundaries of deliberative models. She thinks these examples show us why and how the boundaries need to be redrawn now.

Smith's argument is nuanced and impressively well researched, illuminating both broad intellectual traditions and specific exemplary texts (e.g., Uncle Tom's Cabin). Her account of the uses and meanings of "sympathy" in abolitionist discourse is particularly rich. She offers fresh insights even when primarily engaging work by other scholars: Her commentaries persuasively revise accepted accounts of, for instance, the rise of professional police and the tasks of the slave narrator. Most important, the book succeeds in its larger genealogical ambition of showing how variable, confused, and contested were the antebellum boundaries between argument and violence, reason and passion, and how politically problematical was the drive toward a deliberative conception of democracy.

Still, the argument has some notable shortcomings, for all its impressive scholarship. Some of these concern its approach to history. Smith's accounts of the neoclassical and enlightenment approaches to public speech sometimes reify these ideal-typical constructs, obscuring the messiness of antebellum discursive formations and conflating her categories and concerns with those of her subjects. Similarly, when asking whether slave narratives were able to persuade readers about the facts of slavery, she answers less through an empirical assessment of reader responses than through her own philosophical reasoning about what constitutes good evidence (e.g., p. 197). An inverse weakness mars her otherwise first-rate analysis of abolitionism. The texts she analyzes were thoroughly Christian: On her own account, their politics of storytelling was dependent on readerly consensus about the nature and existence of God. Yet, Smith clearly wants us to take that narrative politics as a model. Can we do so in a more spiritually heterogeneous world? Smith seems troubled by the question but rushes past it, ending the final substantive chapter on a note of confusion and obscurity.

This weakness is carried over to the book's brief and disappointing conclusion. Smith reiterates her claim that contemporary democratic theorists underemphasize the role of compassion and overlook the ways in which reasoned argument can serve domination (pp. 240-1), but although this claim frames her whole project, she neither develops her theoretical argument nor engages the advocates and critics of rational debate. Smith has provided a remarkably rich historical context for the current disputes over deliberative democracy, but she seems strangely unaware of their scope (pp. 4, 241). Yet, the very theoretical issues that concern her are central to work by such contemporary theorists as, say, Iris Young (e.g., Justice and the Politics of Difference, 1997; Interesting Voices: Dilemmas of Gender, Political Philosophy, and Policy, 1990), and they have been crucial to the debates between Habermasians and those influenced by Foucault or Arendt. Indeed, much of the conflict over what has gone under the sign of "postmodernism" touches on Smith's themes. Unfortunately, little evidence of this is found in her book.

Although Smith fails to make the best of the opportunity, that she offers so much that could be put to use in the current debates is one important measure of her achievement. *The Dominion of Voice* exposes, sometimes brilliantly, the scandalously contingent and fraught historical relationship be-

tween democracy and rationality. In doing so, it makes an original and significant contribution to the study of American political thought.

The Common Law Mind: Medieval and Early Modern Conceptions. By J. W. Tubbs. Baltimore and London: Johns Hopkins University Press, 2000. 253p. \$42.50.

Cynthia J. Neville, Dalhousie University

Legal scholars of the modern era have attempted vigorously and with varying degrees of success to find in late medieval and early modern jurisprudence a single "common law mind." The characteristics that set English common law apart from continental models ensured that writers on the law from the thirteenth through the seventeenth century did not speak in a cacophony of voices, and there has been some consensus that a strand of legal thinking can indeed be traced from the Year Books through to the writings of Coke and beyond. The chief representative of this school of thought remains J. G. A. Pocock, whose work first stirred up the scholarly community more than a decade ago (The Ancient Constitution and the Feudal Law, 1987). Tubbs sets himself a difficult task, then, in his attempt to challenge currently received historiography about early jurisprudential writing in England. That he fails to identify a single common law mind is perhaps inevitable, given the breadth of his survey of surviving primary sources. Indeed, he admits that it is a near impossible task: "The most that we can say, on the evidence we have, is that if there was a common law mind in the period, it was divided" (p. 195). Tubbs arrives at these concluding remarks with some assurance, and on the way to doing so his examination of legal writing in England offers thoughtful, if sometimes uneven, analysis.

The attempt to prove the existence of a multifaceted common law mind allows Tubbs to develop two separate themes, both of which are explored at length in each chapter of the book. The first concerns the ways in which legal thinkers from the anonymous compiler of the twelfth-century Leges Henrici Primi through to the great authors of the period preceding the English Civil War conceived of the idea of reason and of the relationship between the legal past and constantly evolving notions about reason. The second theme, less extensively emphasized but equally well developed, has as its focus the degree to which Roman law influenced English law and jurisprudence. Tubbs ranges far and wide in his exploration of both themes, touching on such topics as attitudes toward statute law, the definition of the infinitely variable idea of custom, the place of precedent in legal decision making, and the role of equity in the history of English law. Although the arguments he makes in respect of these subjects are variably sustained, there is much here to provoke both criticism of and praise for the author's use of an extensive range of source materials.

The contention that there never existed a single common law mind is an ambitious claim, and it leads Tubbs of necessity to review and reassess—and often to cast doubt on—the work of scholars who have preceded him. There is hardly a single historian or philosopher, alive or dead, whose arguments are not subjected to careful scrutiny, then rejected. Brian Tierney's treatment of *Bracton*'s use of the terms consuctudo and leges is tenuous because it is based on a misunderstanding of these words (p. 14); T. F. T. Plucknett relies on only "a handful of cases" in what are widely regarded as definitive statements regarding statute law (p.

35). Similarly, Samuel Thorne is mistaken in linking changes in parliamentary procedures with evolving doctrines of statutory interpretation (p. 117) and Charles McIlwain's views of the nature of parliament are based on a "mistaken theory" (p. 157). Pocock himself is wrong in his assertion that lawyers of the early modern period equated common law with custom (p. 129).

Such bold statements are, of course, the stuff of historiographical debate, but they sound rather too strident coming from a scholar as new to the profession as is Tubbs. Moreover, the author's tendency to criticize his predecessors' use of source materials by means of frequent reminders that his own research encompassed an exhaustive reading of "all extant works on English law from the twelfth through the seventeenth centuries" (p. xii) is offset by some notable lacunae in the secondary sources he consulted. For some topics Tubbs relies almost exclusively on long outdated works. Notable is the discussion of the uses for which medieval Year Books were intended, where the only secondary works cited are those of William Holdsworth (pp. 42, 63). More recent studies have superceded the limited conclusions offered by Holdsworth some time ago and in some respects have shown them to be fundamentally flawed.

Tubbs is on much surer and less contentious ground in his treatment of the enduring influence of civilian and canon law traditions on English legal thinking and writing. The argument is not novel: Scholars such as Richard Helmholz (see e.g., Canon Law and the Law of England, 1988; Roman Canon Law in Reformation England, 1990) have maintained consistently that Roman law exerted a more profound effect on the common lawyers of the medieval and early modern periods than legal historians generally allow. Tubbs's strength lies in an impressive ability to offer specific examples of the link between Roman and common law thinking in the writings of various authors. Thus, the (few) passages in the treatises known as Glanvill and Bracton relating to the nature of customary law are almost all "borrowed or derived from the writings of civilian jurists" (p. 189); later still, Sir John Davies (d. 1626), writing on the subject of royal prerogative, employs arguments that are based, "almost without exception," on Roman law authorities" (p. 134). In his more specific discussion of late-sixteenth- and early-seventeenth-century views on custom, however, Tubbs uses the term "classical" rather than "Roman" or "civilian." Here, the strength of the argument depends heavily on the inclusion of Aristotelian traditions of logic within the framework of the term "civilian." The change of emphasis is subtle but essential to what the author believes is an accurate understanding of the role of custom in common law.

Tubbs's conclusions about the influence of the civilian tradition are essentially sound; less satisfying are those offered with respect to the variety of "common law minds" in the medieval and early modern periods. Despite a commendable effort to unravel distinct strands of thought in jurisprudential interpretations of the notion of custom, Tubbs is forced to acknowledge in the end that virtually all discussions about the law were in fact linked inextricably to that same notion. His argument regarding the plurality of common law minds is not as far removed from those of other scholars as he might wish. Still, Tubbs's book provides a salutary, if not altogether convincing, reminder that the incontrovertible schools of thought that so often inform scholarly studies of medieval and early modern English law are in constant need of discussion and, sometimes, revision.

The Third Millennium: Reflections on Faith and Reason. By David Walsh. Washington, DC: Georgetown University Press, 1999. 256p. \$65.00 cloth. \$22.95 paper.

Joshua Mitchell, Georgetown University

"Without war," Rousseau writes in the First Discourse (1750), "there would be no history." What, then, is the place of political philosophy in a cosmopolitan world, in which passions have been transposed into interests, and war has been rendered obsolete by free trade? Perhaps that is a dream for the future, but nevertheless we are justified in asking whether political philosophy is useless when wars end. The efflorescence of political philosophy in the twentieth century-Strauss, Arendt, Voegelin, and a host of others come to mind-cannot be understood without reference to the conflagrations that were witnessed. What now? The century of ideology has ended. Whence political philosophy? After Ideology (the title of one of David Walsh's books [1990]), now what? That is not directly Walsh's concern in Third Millennium, but his recent work wrestles with just this question. The present book extends his ruminations on the subject.

A perusal of the political philosophy literature at the dawn of the new century suggests that Rousseau's intimation is being confirmed: Democratic theory and other largely ahistorical modes of inquiry are rising to preeminence, and the study of the history of political thought seems to many to be of antiquarian interest only. Walsh's book attempts to redress this imbalance by considering the meaning of the advent of the third millennium, both for the West and for the world as a whole. Tocqueville remarks in Democracy in America (1835) that, in the democratic age, man deliberately forgets his past and attends to the immediate concerns of management. Contemporary political philosophy increasingly conforms to this prejudice. For Walsh, our entrance into the third millennium offers an occasion to take stock of the larger meaning of history for human affairs. In doing so, perhaps there is also an opportunity to retool political philosophy for the postideological age, in such a way as to take history seriously again.

What shall we make of the Christian categorization of history, according to which we have just entered the third millennium? This is, for Walsh, more than a mere convenience. It speaks to the ongoing presence of a Christian world, which is confirmed less by doctrinal and confessional adherence than by the existence of those two pillars of the modern, increasingly cosmopolitan, world—the natural sciences and human rights. Both are historically indebted to Christianity and, more to the point, must continue to rely on Christianity in order to retain their coherence. The question of their ongoing debt is the interesting one to consider, of course, since today a great many secular liberals—Walsh is a theological liberal—think that the debt need no longer be paid. Modern man is debt free.

In order to assess this question, the relevant categories must be established. Those whose allegiances are owed to the Enlightenment think that the proper categories are enlightenment, on the one hand, and religion, on the other, the latter of which is taken to be inimical to scientific investigation and the idea of human freedom. Walsh does not cite Augustine, but he well might have. Augustine's City of God (430) supposes that the real alternatives are not enlightenment or religion but paganism or revealed religion. (In Levathan [1651], Hobbes understood this, too.) Man is a religious animal; he cannot live long without enchantment. The question is not whether mortal life will be enchanted but where it will be enchanted.

Myth is one manner in which the world can be enchanted,

but the age of myth is surely over, anthropologically at least. The Greeks, notwithstanding their discovery of philosophy, retained the idea of a cosmos that was enchanted, and so they could not develop natural science worthy of the name (pp. 131-2). With Christianity, however, we have for the first time the definitive possibility of recognizing "this world as a world ... [for] it is only the light of transcendent perfection glimpsed momentarily that reveals the finitude and imperfection of everything else" (p. 130). The possibility of conceiving of a disenchanted world is made possible by a divine condescension "into the world," a phrase that already confirms Walsh's point. Revelation occasions the differentiation that the natural sciences require in order to proceed. Furthermore, by virtue of God becoming man, "no higher value can be attached to finite existence than to regard each individual as a unique irreplaceable vehicle for the radiance of transcendent presence" (pp. 140-1). God in mortal form reveals to man his own final destiny and standing.

The escape from religion is not the precondition for the success of the natural sciences and human rights, far from it. They require a differentiation of reality into distinct aspects that Christianity best provides. The natural sciences are possible because on this side of the divide enchantment is impossible; human rights are possible because on the other side of the divide we find an authorization for human personhood. The ongoing separation, which Christianity decisively achieves, is necessary for the natural sciences and for the idea of rights to remain coherent. Thus, the modern mind is apt to find the twin pillars of the modern age—the natural sciences and human rights—natural to the imagination because, "irrespective of personal inclinations or faith, it is impossible to think outside of the categories defined by the revelation of Christ" (p. 129). Christianity has won! Nietzsche states in The Genealogy of Morals (1887) that "it is the Church and not its poison that offends us." The natural sciences and human rights are the poison that we continue to imbibe, although not to our detriment, as Nietzsche would have it, but rather to our benefit.

Like all historical achievements, however, there is no absolute assurance that the Christian disenchantment of the world will retain its hold on the modern imagination. Walsh's point is that Christianity maximally differentiates the world; the open question is whether such differentiation can be secured into the future without the ongoing presence of Christianity, however conceived.

One of the more interesting claims of *Third Millennium* is that without the existential balance, as it were, made possible by the advent of Christ, which situates all that we do in the context of both finitude and transcendence (p. 144), reason loses its stability, and human life "oscillates between enthusiasm and dejection" (p. 226). Not only science is at risk, however; without a substantive grounding in Christianity, human rights talk proliferates without end. "In place of a well-defined understanding of human dignity, we are left with a blank slate on which anything may be written" (p. 100). To those who argue that the modern achievement of the natural sciences and human rights no longer need acknowledge a debt to Christianity in order to be vouchsafed for the future, Walsh suggests that any deformation in the Christian accomplishment will deform the natural sciences and human rights talk as well

A host of questions can be raised here, some perhaps answerable, some not. If Christianity is necessary, how may we may render it what is due? The influence of Voegelin on Walsh's thinking rules out any easy answer. Moreover, this influence occasionally colors Walsh's assessment of modernity too strongly: The close connection between faith and

reason in this superb analysis quietly indicts the project of the Reformation, which sought to rethink that connection in light of the experience of the radicality of sin and the experience of anxiety that attends it. Because any analysis of the emergence of modernity must give considerable weight to the Reformation, a supplemental analysis is required. Finally, although there is very little in the way of Christian triumphalism in Third Millennium, it would be nice to hear more about the global conversation among world religions that surely will occur in the present century. If Christianity best authorizes the natural sciences and human rights, and if these are the true global currency, then what does this say about the manner in which other religions—or Judaism and Islam within the monotheistic tradition—can authorize such things? These are important questions, for on them hinges two distinct possibilities: either Christian imperialism or the arrival of a genuine global pluralism, in which the natural sciences and human rights are each authorized by endemic religious traditions.

This is a very fine work that I recommend highly to anyone interested in the question of where political philosophy ought to direct its attention now that the totalitarian crisis has receded.

Taking Language Seriously: The Narrative Foundations of Public Administration Research. By Jay D. White. Washington, DC: Georgetown University Press, 1999. 217p. \$65.00.

John A. Rohr, Virginia Polytechnic Institute

This serious, demanding book provides a valuable service to advanced students of public administration and their professors. They will not always like what they read, especially when Jay White tells them they are philosophically naive and scolds them roundly for the poor quality of the research he finds in their doctoral dissertations and in their leading professional journals. Although White overstates the problem, there is just enough truth in his unsettling charges to hurt. Fortunately, there is also enough sound advice on how those inclined to do so may repent their previous transgressions and mend their academic ways.

At the outset, White notes the gap dividing philosophers from public administration scholars and tells us his book "tries to bridge that gap by showing in a clear and understandable way how recent developments in the philosophy of science can help to clarify the logic of research in public administration and related fields" (p. xi). Given the ambitious purpose of his undertaking, White delivers admirably on his promise. His success is due primarily to his impressive command of the literature in both fields and his skillful integration of this literature into his overall argument.

White sets about his task by distinguishing three modes of research—explanatory, interpretive, and critical—and clarifying the differences among them. Distinct as these modes are from one another, he argues that they share a linguistic foundation which researchers ignore at their peril. Hence, the book's title: Taking Language Seriously. This leads to an argument intended to establish the narrative character of this linguistic foundation, which is nicely captured in the subtitle and grounds the main theme of the book, a defense of "the notion of research as storytelling in its explanatory interpretive, and critical modes" (p. 39).

With the salience of storytelling in place, White provides some fascinating examples across a broad range of academic endeavors. The discussions of legal reasoning and literary criticism are particularly well done. Jurists will be impressed by the innovative interpretation of the well-known works of Edward Levi and Benjamin Cardozo. No less impressive are lucid analyses of the writings of Paul Ricoeur and Richard Rorty. All this is undertaken in support of the research-asstorytelling theme.

The author's most illuminating effort is the chapter devoted to the somewhat illusory notion of "action theory." Practicing what he preaches, White tells the story of his own experience as a consultant in an unnamed state's department of social services. His clients, hoping he would recommend the hiring of additional caseworkers, were disappointed to learn that his findings did not support this conclusion. Combining both interpretive and critical modes of research with action theory, White enabled agency personnel to see that the real need was for additional clerical staff to free caseworkers to spend more time and effort on service delivery instead of paperwork.

The book is well organized and well written despite an occasional lapse in grammar or syntax. Particularly helpful are the brief introduction and conclusion in each chapter. They guide the reader through the intricacies of White's closely reasoned text.

The major flaw is White's excessive claim that "all research is fundamentally a matter of storytelling or narration" (p. 6). He makes a good case for the linguistic foundation of research, but the lyrical leap from there to storytelling as the basis for all research relies far too much on assertion and the uncritical acceptance of writings by authors of White's persuasion. Indeed, he seems to assert that storytelling is the

only alternative to the discredited universal laws "in the positivist conception of scientific knowledge" (p. 22). Such a position can be defended only by insisting upon an inordinately broad definition of "storytelling" that would fit the foreordained conclusion but do violence to the meaning of the word and thereby undermine White's case for "taking language seriously."

Specialists in public administration will be disappointed that White does not get around to stressing its character as a "profession" (p. 167) and a "field instead of a discipline" (p. 179) until the final pages of the book. This is too little and too late to parry the thrust that his criticisms of public administration treat it precisely as though it were an academic discipline. Particularly telling are his negative comments on the quality of research in Public Administration Review (PAR). White and the critics whose works he cites seem to ignore PAR's role as the professional journal of the American Society for Public Administration, which is not an academic association. PAR publishes manuscripts submitted by both practitioners and academics. It should come as no surprise that much of the research published in this journal is "applied rather than basic" (p. 1) and, I would add, rightly so. This point is reinforced by the fact that a substantial portion of work in the field is intended to refute extravagant attacks on the administrative state. During the past quarter of a century, public administration has been a field under siege, and its defenders offer no apology for presenting applied research to address the practical problems of the day.

American Politics

Gay Politics, Urban Politics: Identity and Economics in the Urban Setting. By Robert W. Bailey. New York: Columbia University Press, 1999. 396p. \$49.50 cloth, \$22.50 paper.

Kenneth J. Meier, Texas A&M University

The theoretical goal of Gay Politics, Urban Politics is to demonstrate how traditional economic or political economy approaches to urban politics are incomplete, especially when examining gay political issues. Robert Bailey champions identity politics as an alternative framework, not to displace the predominant economic orientation but to qualify and sharpen the economic perspective. Identity politics, the process of defining oneself politically, including an identity as gay, lesbian, or bisexual, still requires an individual or collective interest, but that interest might not be economic. "Changes in status, access, and the distribution of affirming symbols would also be considered as an important policy effect" (p. 14).

To illustrate the argument, Bailey examines the political attitudes, voting behavior, and residential patterns of gays and lesbians. He then follows with four in-depth studies of Birmingham, New York, Philadelphia, and San Francisco, cases selected to illustrate both the range of gay politics in different cities and to cover a collection of different issues, such as redistricting, schools, police practices, and domestic partnerships. The result is a fairly representative cross-section of gay politics at the local level in the United States. Bailey concludes that "sexual identity has challenged several cities" traditional governance patterns" (p. ix).

Gay Politics, Urban Politics has much to commend it. First, Bailey's analysis of the political behavior of gay people uses

an astonishing set of sources (exit polls, census data, mailing lists, membership lists, and so on) in an aggregate analysis. The result is a clever gleaning of information about gays; the method could serve as a blueprint for studying other groups that do not appear in large enough numbers in national surveys. Second, the four case studies are carefully done and well designed. Not all issues can be covered in a single book, but the reader is left with the impression of a serious effort to cover the waterfront and at the same time provide the rich detail of the actual politics in the four cities. Third, the book directly and indirectly sets a research agenda for this area. The clever construction of mass behavior data could be used to distinguish between gays and lesbians. Despite much anecdotal evidence that the political identification process of lesbians differs from that of gay men, systematic assessments are nonexistent. Similarly, taking Bailey's argument about identity seriously, as it should be, suggests returning to methods such as Robert Lane's, with long, in-depth interviews rather than more traditional short survey work.

Bailey does less well with his postpositivist indictment of mainstream political science for ignoring gay politics. Identity is clearly an important concept for anyone studying gay politics. The process by which individuals sort out potential identities and the process by which being gay is both a personal and a political identity is central to understanding gay politics. Despite an extended argument, however, the difference between a positivist use of categories and the identity approach of Bailey is unclear in the chapters on gay political behavior. Jargon often mars the theoretical arguments: "What separates 'identity politics' in gay and gender studies from identify politics as an aspect of the decolonization process is its emphasis on the psychological and constructionist aspects of political conflict and a deep resistance

in gay and lesbian studies to the reification of any category" (p. 23). The argument that mainstream political science has ignored gay politics, in addition, is not as strong as Bailey paints it. Bailey does not cite work on gay politics in mainstream journals by Kenneth Wald, James Button, and Barbara Rienzo (there is a single peripheral citation to their book), Donald Haider-Markel, James Gibson, Barbara Gamble, and M. Kent Jennings and Ellen Andersen. Gay politics is a dynamic, growing field of political science that cuts across numerous subfields. Scholars who ignore this developing literature do so at their peril.

Every scholar of gay politics, and I think every scholar of urban politics, will want a copy of this book. Students of political behavior, although they are likely to be critical of some of the analysis, could benefit from reading about Bailey's efforts to mine secondary data. The book could serve as a text for graduate classes in urban politics, social movements, and identity politics. The philosophy of science discussions might be somewhat heavy for most undergraduates, but the substantive chapters could easily be used in classes at that level as well.

California in the New Millennium: The Changing Social and Political Landscape. By Mark Baldassare. Berkeley: University of California Press and Public Policy Institute of California, 2000. 283p. \$27.50.

Greg Andranovich, California State University, Los Angeles

In a recent essay in the Los Angeles Times (July 9, 2000), Richard Rodriguez notes that times are changing when the newly elected president of Mexico, Vincente Fox of the National Action Party (PAN), addresses a news conference in his country in English, and U.S. presidential candidates Gore and Bush address rallies here in Spanish. What is going on? The changes underlying these remarkable events are documented in Mark Baldassare's California in the New Millennium. The book is an analysis of the California vote in the 1998 midterm election, reported in a policy-oriented style that is very accessible to the interested reader. The analysis is based on a series of focus groups and five voter surveys conducted during the 1998 election cycle (reported in six appendices covering 46 pages), backed up by voting records and other published data.

Baldassare focuses on three trends that have played a confounding role in California politics for some time but may be on the verge of changing how we think about governance issues. These are political distrust, racial and ethnic change, and regional diversity. Following a short introductory chapter to establish the California policymaking context and to describe the data and methods, four substantive chapters describe and analyze the election year data. These provide a wealth of information but are organized in a fashion easy to follow (i.e., description of data and focused political history, election results, policy implications). The climate of political distrust is the first topic and is covered in two chapters, one of which focuses on political disengagement and distrust. These are examined through a discussion of survey and focus group findings on voter turnout, interest in politics, gaining political information, attitudes toward the federal and state government, and attitudes toward government intervention in people's lives.

If voters do not believe in the efficacy of the state's politicians and political institutions, how is policy made? This is the topic of the second substantive chapter on distrust, the

voters' revolt. The rise of the independent voter in California and the use of the ballot initiative to bypass the state governmental process are analyzed historically and in the context of the 1998 election. California's short-lived blanket primary (Proposition 198 was approved by state voters in 1996 but struck down by the Supreme Court after the 2000 primary election in June, after this book was released) is used as an example of the continuing erosion of political parties' importance to voters in California. Baldassare's analysis of the vote on four ballot initiatives (two passed but two others failed; there were 21 ballot initiatives in the June and November elections) highlights the larger lesson of policy unpredictability; the number of ballot initiatives and their complexity has grown, and the interest level and attention by voters has waned.

The third substantive chapter addresses racial and ethnic change, and a prominent place is given to the role of the Latino voter in California. Only one in seven voters in 1998 was Latino, but one in five eligible adults in the state is Latino. Although the Latino voter has been less interested in politics ("nonengaged") than the notoriously uninterested white voter in California, the July 2000 election of the opposition candidate in Mexico, coupled with the changes Baldassare documents, will increase the unpredictability of the Latino vote in the November 2000 U.S. election.

The fourth substantive chapter raises perhaps the most troubling topic for California politics: great regional diversity. Distinct differences based on population composition, growth patterns, economies, geography, politics, and public concerns make it very difficult to develop a public policy consensus. Baldassare notes that the one commonality shared across the state is the high degree of political inattentiveness in the 1998 election cycle, and state elections focused on regional distinctions rather than statewide similarities.

The final chapter begins with eight conclusions that can be derived from California's political history and the 1998 election cycle. Among these are: Reaching public consensus on policy issues will be more difficult if current trends continue; California elections will continue to be dominated by political distrust; initiatives will continue to play a major role in elections and in shaping policy directions; Latino voters will play an increasingly important role in state elections; central valley voters will increase, which will shift the balance of power and policy priorities. Baldassare concludes his analysis with an excellent discussion of ten policy recommendations to combat these trends, and a number of them could lead to beneficial discussions in many other states (e.g., state government should remove barriers and create more programs to encourage registration and higher participation; the initiative process should include legal testing; state and local governments and the private sector should encourage "smart" regional growth).

Overall, the book does a very good job of interweaving the structural changes in California's political landscape with political attitudes and election behavior to show how the public policy process is affected. Although the surveys are for one election cycle (and the raw material is provided in the appendices for critique), the author does an excellent job of contextualizing the 1998 data. A drawback, however, is that a lot of survey information is presented and a lot of comparisons (e.g., 60% to 35%) are made. And the book's relevance suffers from a generic problem of policy analysis, a changing policy environment. The recent Supreme Court decision that struck down the blanket primary might require a more tempered view of the role of the independent voter in California's primary process, just as the recent election in Mexico might require a less tempered review of the nonen-

gaged role of the Latino voter in California. We will know in November.

Finally, one might quibble with certain categorizations (e.g., within-region differences in an area as large as the central valley are masked by aggregating the data), but this book raises provocative questions regarding the relationship among social change, elections, and policymaking, and the uniqueness of the California survey data contribute to a better understanding of the politics of change.

Creative Politics: Taxes and Public Goods in a Federal System. By Glenn Beamer. Ann Arbor: University of Michigan Press, 1999. 174p. \$39.50.

Paul Brace, Rice University

The premise of *Creative Politics* is that federalism matters. It matters for all the familiar reasons. It creates both horizontal (interstate) and vertical (federal-state-local) political relationships that offer opportunities and constraints for policy-makers. It alters the incentives and constraints individuals face when making public policies, circumscribes a domain of feasible alternatives for politicians, and shapes how voters favor or oppose various policies and programs.

Beamer proposes that past models of federalism have been preoccupied with the structures and purposes of this form of governmental organization, but they have devoted insufficient attention to how actors in political institutions view the politics of federalism or capitalize on the political opportunities federalism creates. To rectify this shortcoming, Beamer conducted case studies in eleven state legislatures in 1994 and 1995. He selected these geographically representative states because each was considering changing one of its basic taxes. He conducted open-ended interviews with 123 state legislators and dozens of legislative staffers, lobbyists, local officials, and political activists.

Two core questions anchor the book. First, how do the relationships among institutions at various levels of government, and the levels of competition between each, influence the collective decisions that are reached? Second, how does the public sector's responsibility for the provision of collective goods change the nature of federal politics? His interviews were guided by these questions and a general interest in the perceptions these individuals held concerning taxation, education financing, economic development, health care, and government mandates.

Perhaps the strongest chapter develops a model of representation embedded in federalism that incorporates the nonexclusionary nature of public goods in the representation calculus. The model clarifies representatives' individual governing principles, how relationships among levels of government influence representatives' thinking, and how the nonexclusionary nature of public goods leads to variations in state politics and federal policies. Presumed to be motivated by a desire to improve the benefit/tax ratio of their constituents, representatives structure policy changes within the incentives and disincentives offered by the federal matrix. The dependability, horizontal and vertical transferability, obscurability, accountability, and equity offered by various policy options shape representatives' choices.

The model might strike some as too complex to serve as a useful heuristic. Given so many principles, levels of government, and policy options, it becomes difficult to lay out concrete hypotheses about the conditions under which certain policy choices will and will not be preferred, or why. In

fairness to the author, it would be better to direct this criticism at the nature of the phenomena being studied than to any inherent shortcoming in the model. Beamer has added realism at the cost of parsimony but not without reason. It is sensible to argue that understanding the particular effects of federalism on policy can necessitate consideration of a broad array of factors.

This breadth does not come without a cost. In ensuing chapters the basic thrust of the model is evaluated with interview results, and readers may reasonably wonder whether any or all propositions stemming from the model could be both true and false simultaneously. The anecdotal accounts derived from legislators and others are often colorful and entertaining, but they do not always connect well or serve as convincing evidence in support of some of Beamer's arguments. This is not to say he is wrong, but because of the general looseness of the interview approach, it is not clear what could serve as falsifying information.

Beamer evaluates several major issues in state finance and policy. One seeming enigma concerns why, given the incentives in the federal Tax Reform Act of 1986, states have not adopted their own income taxes. With the exception of Connecticut, no states have instituted new income taxes, and the general trend has been toward an increased reliance on sales taxes. Beamer reasons, not unrealistically, that income taxes are a symbol of big (federal) government; they are paid in large increments and thus are very noticeable to constituents; and those in place became high by virtue of inflation in the 1970s and the resulting bracket creep. Legislators seek taxes with obscure costs to voters and, consequently and despite federal incentives, continue to favor sales taxes over income taxes. This is far less than an ideal outcome, however. for two reasons: Sales taxes may fail to generate sufficient revenues to meet increasing demands for services, and the rise of e-commerce and mail order sales has changed the nature of many sales transactions.

Economic development is another issue Beamer explores. It has come to encompass almost every aspect of state policymaking. Education, infrastructure, and even prison construction are now cast with an eye toward their effects on state economic prospects. According to Beamer, legislators find economic development attractive because it offers the hope of improving the benefits/tax ratios of constituents. Among the legislators Beamer interviewed, virtually all had an opinion if not expertise in the area of economic development. In the literature there is a division concerning whether to promote growth with incentives and tax abatements to industry or with investment in education, training, and improved physical and technical infrastructure. Some legislators choose the particular-benefits (incentives) approach to claim credit for job creation. Others pursue public-goods (investment) strategies to claim credit for the education and infrastructure benefits. Just as the move to sales taxes is arguably far from optimal, it is also true that the obsession with economic development continues unabated despite limited evidence these policies work and some evidence they may harm state fiscal health.

A key component of much of the economic development debate concerns the role of education. Beamer considers public education financing in the states and how choices concerning education provision are linked to the taxes imposed to finance it. Over the past three decades, states have come to play a larger or even dominant role in the financing of education. Much of this change has resulted from drives for property tax reform. Beamer argues that current taxes and tax rates influenced the extent and content of property tax reform and that mechanisms for change (legislative,

judicial, referenda) influenced reform proposals and choices. Ultimately, the shift from local to state financial responsibility raised significant issues concerning accountability, as responsibility for administration remained at the local level. Here again, the drive for less objectionable but still revenue-sufficient taxes seemingly produced an outcome that arguably was less than ideal.

The last policy area Beamer considers is health care. He notes that although the federal government tried and failed to pass health care legislation in 1994, many states had already adopted some kind of reform. In these cases, however, they were largely responding to policies first adopted by the federal government that influenced the parameters of state policies and politics in the first place. When enacted, Medicare reduced demands for state funds for health needs of the elderly and created slack resources that the states would then use to provide matching funds for Medicaid to provide health care for the poor. Medicaid, however, consumed an increasing portion of state budgets, growing from 10-18% of total state budgets between 1987 and 1993 as costs skyrocketed, and Beamer notes that these escalating costs forced legislators to reshape health care policies in the states. By the 1990s, they were promoting reforms to transform the particular-benefits program (Medicaid) into a public good. Efforts to bring subsidized managed care into Medicaid to produce savings that would expand coverage or increase state general-revenue funds were common. Once again, however, we might wonder whether these reformsdriven by the timing and parameters of Medicaid changes, the ability of state politicians and bureaucrats to convince federal officials to grant Medicaid waivers, and the availability of acceptable tax options to fund them were ideal in terms of the breadth and scope of health care coverage.

Long ago Louis Brandeis described the states as laboratories of democracy. The virtue of this arrangement was that, rather than have single policies developed and imposed by a unitary government, the states were free to experiment with different policies, abandoning those that failed and mimicking those that worked. This view of federalism must be contrasted with contemporary concerns about a "race to the bottom"; that is, locked in the grip of horizontal competition and receiving fewer resources from the federal government, states are driven to cut or reduce all programs not directly related to economic development: From this perspective, the states may be agents for change and experimentation, but they choose from a greatly circumscribed array of policy options in the competitive milieu of federalism.

In the end, there is probably an element of truth in both perspectives, and Beamer makes this clear. From reading the book it is evident that states are repositories of considerable creative political energy. These energies, however, are often directed at the issues or constraints imposed by federalism. In each of Beamer's examples, the dominant policy choices made by the states are arguably far from ideal and were developed as much for expediency as efficacy. This is not to say the choices could not have been worse, and it does not suggest that policy change was unresponsive to public sentiment. It is to say that the politics of federalism within states takes place within a domain of feasible alternatives, and often this domain does not intersect with the set of optimal policies. In his descriptions of the tax and policy choices made by state legislators, Glenn Beamer has helped clarify this crucial issue. The book is a good choice for students of state politics, public policy, and federalism.

Race, Money, and the American Welfare State. By Michael K. Brown. Ithaca, NY: Cornell University Press, 1999. 381p. \$55.00 cloth, \$22.00 paper.

Joseph P. McCormick II, Howard University

A sound understanding of the formulation and legitimation of social welfare policy in the United States involves making some sense of the interplay of the following set of factors: presidential initiatives and the guidance that the chief executive receives from his advisors; congressional responses to those initiatives (and the partisan and regional features that influence those responses); fiscal policies tied to capital accumulation, national economic growth, and deficit control; interest group politics electorally linked to the aforementioned congressional responses; and racialized decision making, which in America tends to taint directly or indirectly all the aforementioned factors. A number of scholars have given analytical attention to some of these aspects in their efforts to understand the evolution of American social welfare policies (e.g., W. J. Wilson, The Truly Disadvantaged, 1987; Hugh Graham, The Civil Rights Era, 1990; Jill Quadagno, The Color of Welfare, 1994; and D. C. Hamilton and C. V. Hamilton, The Dual Agenda, 1997), but few have attempted to weave all of them together and describe national social welfare policies across time, from the inception of the welfare state in Franklin Roosevelt's New Deal through the first Reagan administration. This is the carefully documented task that Michael Brown, a political scientist, takes on in this wellwritten book.

Brown mines a multidimensional database: the extant literature on various dimensions of the American welfare state; archival material from the files of presidents Roosevelt, Truman, Kennedy, Johnson, and Nixon; records of the Bureau of the Budget, the Social Security Board, and the Works Progress Administration; the papers of the National Association for the Advancement of Colored People and the National Urban League; the George Meany Memorial Archives (which provide a range of perspectives from organized labor); doctoral dissertations on various facets of this complex topic; congressional hearings; and interviews with offlcials who served in both the Johnson and Nixon administrations. Such a database provides ample material for telling a story with which one must be familiar in order to appreciate fully the sort of welfare reform that occurred in this country toward the end of the twentieth century.

Brown's able historical analysis takes us from the first administration of Franklin Roosevelt (chaps. 1 and 2), when the American welfare state was created; through the administrations of Harry Truman (chap. 3) and Lyndon B. Johnson (chaps. 6, 7, and 8), under whom the welfare state grew and became more redistributive; to the first administrations of Richard Nixon (chap. 9) and Ronald Reagan (chap. 10). The GOP "laid the foundations for an assault on the [American] welfare state and ushered in the collapse of New Deal liberalism" (p. 352). That assault resulted from the outcome of the 1994 congressional elections, which mark the temporal stop sign of this book.

There is a useful discussion of universalistic social policies (which are more common in Western Europe and which tend to diminish class and racial differences) versus those that tend to be means tested (which are more common in the United States and which tend to accentuate both class and racial differences), theoretically grounded in the work of Joseph Schumpeter (none of which is cited in the book) and Gunnar Myrdal (whose seminal work, *The American Dilemma*, 1944, demands acknowledgment among those who write about racial issues in American politics). Brown then singles out for

analytical attention "the strategic choices of policymakers (chiefly the presidents from Franklin Roosevelt to Richard Nixon) and the self-interested actions of the main advocates and opponents of a federal controlled welfare state" (p. 17). These are major factors that aid our understanding of the "variegated pattern of social [welfare] provision in the United States" (p. 17). These policy choices, the author tells us, were shaped largely but not entirely by money and race. Both these factors, perhaps more than others, shaped the size and scope of the American welfare state as well as its beneficiaries. In this regard Brown reminds us: "It is the capacity to tax and spend that determines what kind of welfare state emerges" (p. 6). In fact, "questions of fiscal capacity—the ability of policymakers to raise [the] revenues necessary to finance new policies to spend—lie at the center of the political development of the American welfare state" (p. 7).

If fiscal capacity lies at the center of the political development of the American welfare state, then racial stratification and its attendant behavior component, racialized decision making, are core and contextual factors that contribute to its programmatic content and operation. Far too many scholars who deal with various aspects of America's multidimensional racial dilemma use "race" in a vague and uncritical manner. Historically, the use of this concept has tended to direct analytical attention to "race relations" between blacks and whites. Brown's discussion goes beyond such a superficial distinction and leads him to a systematic examination of two key components of racialized decision making: racially motivated exclusion, which was more common in labor markets during the administrations of Roosevelt and Johnson, and the exploitation of racial differences, which was a key element in policy decisions of the Nixon administration. Racially exclusionary public policies in various arenas of American society have been declared unconstitutional and offset by more ameliorative policies that emphasize racial inclusion, but the legacy of racial stratification in the now dissolving American welfare state and reproduced over time by the policy choices of various presidential and congressional policymakers nonetheless lingers. In at least three places in this book-chapters 5, 8, and 10-Brown provides some detailed discussion of how racialized decision making, along with a number of other factors, shaped the content of social welfare policies.

The conceptual linchpin in Brown's analysis is his notion of "truncated universalism" (chap. 3). This term is used to describe the sort of welfare state that had emerged by the time of the Truman administration. Political circumstances and efforts by organized labor as well as tactical concessions by owners of capital (chap. 4) led to a particular pattern of social provision: "a welfare state that mingled the equalitarian promise of universal social insurance [envisioned by the New Deal but never fully realized] with a fragmented assortment of public policies (veterans and housing programs) and private social policies (health and pension benefits subject to collective bargaining)" (p. 100). Brown points out that the de jure distinction established between social insurance (e.g., Old Age and Survivors' Insurance, aka: social security) and public assistance (e.g., initially Aid to Dependent Children, which by 1950 had become Aid to Families with Dependent Children; Old Age Assistance; and Aid to the Blind), established by the Social Security Act of 1935 become racialized, such that less well-off African Americans came to be proportionally overrepresented within the public assistance component and proportionally underrepresented in the social insurance component.

The racialized character of the American welfare state, Brown's analysis indicates, was a reproduction of the class and racial stratification that existed in the larger society and out of which the American welfare state emerged. During the New Deal period, racial discrimination, particularly in the South, was legally sanctioned in the labor and housing markets as well as electoral politics. Some of the principal legal architects and defenders of this apartheid system, southern congressional Democrats, occupied key chairmanships in both the House and Senate and could veto social welfare initiatives that even remotely suggested a transformation in the American racial hierarchy. Racial patterns set in place at this time tended to become further entrenched by fiscal policies initiated by various presidential administrations, congressional responses to those initiatives, and interest group behavior either in support of or in opposition to the programmatic content and direction of social welfare policy.

Although the Personal Responsibility and Work Opportunity Act of 1996 is not singled out for treatment (it receives but one sentence, late in the book, and is not specifically mentioned by its legislative title), an observation that Brown offers in the final chapter underscores why I think this book is of value to students, policy practitioners, and scholars who wish to have a better understanding of the nature and evolution of social welfare policies in the United States: "The history of race and social class [and the fiscally circumscribed decisions of various presidential administrations] in the development of America's welfare state . . . provides a critical perspective on these arguments and a basis for assessing our contemporary predicament" (p. 360). A sound understanding of the present must begin with the kind of analysis of the past that Brown provides in this provocative piece of scholarship.

Driving Forces: The Antomobile, Its Enemies, and the Politics of Mobility. By James A. Dunn, Jr. Washington, DC: Brookings Institution Press, 1998. 230p. \$44.95 cloth, \$18.95 paper.

Michael N. Danielson, Princeton University

America's enduring romance with the automobile is one of the great love stories of the twentieth century. It is a tale of fulfillment for many, disappointment for some, and enormous change for all. More than is the case with most components of the American political economy, automotive transport has been a public-private partnership in which government's role has been central. From the dawn of the automobile age, government has provided the right of way for cars, trucks, and buses, investing billions of dollars in highways, streets, traffic controls, and other essential infrastructure. James A. Dunn examines the interplay of industry, government, and the public in *Driving Forces*.

Dunn's work has much to commend itself for political scientists. The author underscores the tremendous political appeal of the automobile, which derived primarily from the enhancement of personal mobility and freedom of movement. The financing of public roads through "user taxes" ensured highway agencies a source of funding that is widely perceived as legitimate. Dunn properly emphasizes the critical interplay between automotive transport and urban development that created the sprawling low-density contemporary metropolis, an urban form utterly dependent on automobile and highway, serving a population that resists efforts to limit freedom of movement or increase the costs of automotive use. Dunn grounds his analysis in the interest group literature as well as Anthony Downs's issue-attention cycle, the work of Paul Sabatier and Hank C. Jenkins-Smith on advocacy coalitions, and James Q. Wilson's client-interest group-majoritarian-entrepreneurial politics typology.

Dunn examines a number of policy arenas: highway finance, air pollution, safety, sprawl, and rail alternatives to the automobile. At times, this analysis bogs down in minutia, particularly legislative maneuvering, that obscure the broader political and policy trends. Dunn also largely ignores a critical element of automotive politics: road building and the shift of power from road builders to affected publics. He properly emphasizes the importance of the responsiveness of politicians to their auto-loving constituents, but many of these same constituents resist highway construction projects that would adversely affect their communities. A study that relies so heavily on public acceptance in explaining the dominance of automotive transport would be more persuasive if the analysis encompassed adverse public reaction to highways and the responses to it, which have restricted road building and increased the costs of those roads that are built.

The failure to treat public resistance to roads is symptomatic of a larger problem with this study. Dunn seeks to do more than explain automotive politics and policy; his goal is to discredit those who advocate alternatives to automotive transport, especially environmentalists who worry about air pollution, planners troubled by sprawl, and promoters of urban transit and intercity passenger rail service. These policy vanguards, as he terms them, undervalue the automobile and its attendant freedom and mobility, they overestimate the dangers of sprawling urban development and global warming; they promote expensive and inefficient rail transit schemes; and they propose land use and travel regulations that are anathema to the American ideals of freedom and mobility.

The problem is not that Dunn is off the mark in much of his critical appraisal of the automobile's "enemies" or in his negative assessment of the political prospects of most of their policy agenda. He provides ample documentation of the policy shortcomings and political weaknesses of environmentalists, planners, transit advocates, and auto haters. But Dunn's desire to discredit the critics leads him to understate the importance of the costs of automotive transport and thus the necessity for more far-reaching changes than the mild incrementalism advocated here. Sweeping changes already have occurred in the policy system—highway trust funds are used for other modes, regulation has reduced automobile emissions, foad building must accommodate community values and NIMBY concerns—changes that are not adequately explained by Dunn's paradigms. Public views about the automobile need to be disaggregated: The American love affair does not extend to a public embrace of air pollution, unsafe vehicles, or highways in one's backyard. As valuable as this study is in providing a comprehensive political analysis of the contemporary struggle over automotive policy, the model is too static to explain some of the most important policy and political changes that have occurred over the past quarter century, or those that seem certain in the not-too-distant future as congestion increases, pollution worsens, and the earth gets warmer.

The Choices Justices Make. By Lee Epstein and Jack Knight. Washington, DC: Congressional Quarterly, 1998. \$21.95 paper.

Pablo T. Spiller, University of California, Berkeley

Choices questions the presumption, prevalent among many law and political science scholars, that decision making by justices is based either exclusively on legal issues (as assumed by the traditional legal profession) or exclusively on ideological tendencies (as suggested by the attitudinalists). Instead, the book's premise is that justices are—as humans—strategic,

and their strategies are conditioned by their own preferences, the preferences of their competitors (other justices and other institutional players, such as Congress), by institutions (internal and external to the Court), and by public opinion.

The strength of the book is its systematic analysis of this issue using both the Court's public records and data from the private papers of justices Brennan, Douglas, Marshall, and Powell. (The data used in *Choices* are available in http://artsci.wustl.edu/~polisci/epstein/choices/.) The authors combine basic statistical analyses with direct citation from the private papers. Along the way, one tends to be convinced that justices are, indeed, strategic players. *Choices* shows that strategic behavior and thinking permeates the Court throughout its opinion production process, all the way from the *Cent* conference, to the negotiations on the opinion writing, to the writing of concurrences or dissents.

The book lacks, however, an analytical framework to explain when strategic considerations within the Court are important. Let me start with the median voter theorem, which specifies that with Euclidean preferences, a single-dimension policy space, and no agenda-setting powers, the median voter's ideal point is the only equilibrium. No more assumptions, strategic or otherwise, are needed. Once the median policy is proposed, no other proposal will beat it, and it becomes the outcome.

Consider, now, voting within the Court. The only agenda power of the chief justice (or the senior justice in the majority) is the assignment of who will write the opinion, but, as Choices shows, other justices make all sort of suggestions (proposals) through memoranda, conversations, and concurrences. In principle, then, the agenda power in the Court is minimal at best. When issues are single dimensional, a majority should not be that hard to form, in principle, and should include the "median" justice on that dimension. One can understand the communications among justices as simply preference revelations, so as to figure out who is the median justice and, as a consequence, what is the median outcome. Indeed, unless it is expensive to write an opinion, an issue never formally addressed in this book, the final opinion could not differ from the median justice's preferred opinion. If there is any difference with her preferred outcome, she would write such an opinion and garner a majority. Asymmetric information about preferences, however, does not trigger strategic behavior in the absence of writing costs. Justices simply reveal their preferences, and the median justice's preference prevails. (In multiple-dimension issues, the median may not be properly defined. But observe that for most cases facing the Court, the policy space resembles more a lattice than a compact set. As a consequence, stable majorities could form, although not necessarily.)

Consider the vote in Craig v. Boren over the appropriate test to assess sex-based classifications (chap. 1), a case to which the authors refer throughout the book. Essentially three options were presented to the Court. The strict scrutiny standard was advanced by Craig, the plaintiff; if adopted, the Court would almost never uphold a sex-based classification. Oklahoma advanced the rational basis standard; if adopted, the Court would almost never reject a sex-based classification. The ACLU, as amicus curiae, proposed something in between, a test now called heightened scrutiny; if adopted, the Court could strike down some statutes and uphold others. At conference the Court was divided. Justices Burger, Stewart, Powell, and Rehnquist favored the rational standard, justices White and Stevens preferred something in between, justices Brennan and Marshall favored the strict standard (although Brennan suggested that an in-between standard would be a viable solution), and Justice Blakmun was undecided but leaned toward Craig. On the merits only, Rehnquist leaned toward Oklahoma, and all others leaned toward Craig.

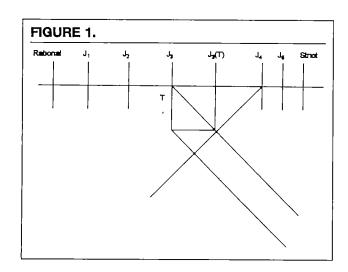

Once the case is granted Cert, then, the outcome will have to favor Craig, preferred by eight out of nine over Oklahoma. But the Craig position cannot be reconciled with the rational standard. A decision setting a standard would have to rule for either the in-between or the strict scrutiny standard. But the latter will not win, as six out of nine prefer something else. At conference a majority was formed by justices Brennan, White, Marshall, and Stevens. The first three advocated a strict standard, but Stevens preferred something more than rational but less than strict, in other words, something in between. Brennan assigned to himself the writing of the case. He cannot expect to get a majority with a strict standard, and those who advocate the rational standard cannot obtain a majority. Simple majority voting suggests that a middle-ofthe-road outcome is the equilibrium. Indeed, the median voter theorem says that a policy representing those who want something in between (such as the ACLU's standard) will be the equilibrium decision. Brennan cannot write anything too different from such a decision, as someone else would make a proposal (probably someone who is not in the majority) that upheld Craig but set a standard in the middle.

The interesting question is not why Brennan (and several other justices) voted for something contrary to his stated preference, but why he assigned to himself the writing of the case (p. 9) rather than let someone else write it. To understand this, one has to bring opinion writing costs to the analysis.

Assume that writing an opinion imposes a cost of T on the writer. Assume that the utility function of justice, j, is given by $V_j(x,I_j) = u(|x-x_j|) - I_j^*T$, where x is the policy being voted on; x_j is the ideal point of justice, j; and I_j is a variable equal to 1 if j writes the opinion and to 0 if she does not. See Figure 1.

With no agenda setting, justice 3 is indifferent between writing his own opinion in favor of in-between standard, J_3 , or letting any other justice write an alternative opinion, as long as the in-between standard is no farther apart than is $J_3(T)$ from his ideal point. $J_3(T)$ is the policy to the right of J_3 , which leaves 3 indifferent between writing the opion or letting someone else write an opinion to the right of J_3 .

Assume that J_5 is the justice with the ability to say who will write the opinion. Then the justice will assign justice 4 (or himself) to write the opinion. Justice 4 knows that she cannot set the in-between standard farther to the right than $J_3(T)$,

because justice 3 will offer a decision at J_3 , or even justices 1 and 2 will offer a decision to the left of J_3 . Thus, justice 4 will give an in-between opinion at $J_3(T)$. (Justices to the left of 3 could think about offering a similar opinion to the left of 3 [i.e., a little closer to J_3 than to $J_3 - 2J_3(T)$], but if they are forward seeking, they know that justice 4 will match that by offering a decision just to the left of $J_3(T)$, until the final outcome becomes J_3 , but the writing cost is incurred not by 3 but by either 4 or perhaps 2. In order for this not to be an equilibrium, it has to be the case that $V_2(J_3,1) \leq V_2(J_3(T),0)$. If V(.) is linear, the equality holds, and there is no gain for 2 to undertake the action.)

We see that the power of agenda setting is in that 3 will vote with justices 4 and 5 for an in-between decision that is not his most preferred position. Similarly, justice 4 will write an in-between decision different, also, from her most preferred decision. But $J_3(T)$ is the unique equilibrium given that 5 (or 4) has the power to assign the writing of the decision.

Observe that the distance between $J_3(T)$ and J_3 depends on T, the writing costs, as well as on the saliency of the issue (the slope of u(.)). The larger is T, the farther apart is $J_3(T)$ from J_3 ; the higher the saliency, the closer is $J_3(T)$ to J_3 . Writing costs are a function of the complexity of the case, the urgency of the case, and the shadow value of time of the justices and their staff. The more crowded the docket with important cases, the higher is the shadow value of time and, hence, the greater the agenda power of the justice who assigns case writing. Strategic behavior becomes important in complex and urgent cases as well as in periods when the docket is full. But an important result of this framework is that the more salient the case, the less important is agendasetting power and the greater the power of the median justice.

Coming back to Craig v. Boven, it now becomes clear that Brennan's writing was more toward the strict rationale than justices Stevens or Blackmun would have preferred, but for them to garner their own majority would imply writing an opinion from scratch, a cost they seemed unwilling to pay. Why did Brennan assign the case to himself rather than give it to White or Marshall? In principle, if either of these two justices had written the opinion, the outcome would have been similar, and Brennan would have saved himself some time. It could well be that White and Marshall were extremely busy (or the case was not too salient for them), so they would produce a decision not very palatable for the median justices (Stevens and Blackmun). That could have triggered a round of alternative opinions which would end with a decision closer to the position of Stevens and Blackmun than Brennan desired.

In summary, *Choices* is an extraordinary and stimulating book. It is a most welcome addition to our literature.

Why Americans Hate Welfare: Race, Media, and the Politics of Antipoverty Policy. By Martin Gilens. Chicago: University of Chicago Press, 1999. 296p. \$25.00.

Joe Soss, American University

Why Americans Hate Welfare is a lucid and provocative investigation of how Americans think about poverty and what they believe government should do in its efforts to help the poor. Readers who hope to find a compelling explanation for hostility toward public aid will not be disappointed. In fact, this carefully argued study delivers far more than its title

promises. Sifting through a welter of poll results, Gilens shows that "much of what is commonly believed about Americans' attitudes toward welfare is wrong" (pp. 1–2). His account of public opinion is nuanced, informative, generous, and in places unsettling. It is also the point of entry for an incisive analysis of how race has come to pervade and distort poverty politics in the United States. Few books, if any, have done so much to demonstrate how racial stereotypes shape the treatment of poverty in mass media, public policy, and the minds of citizens.

Most readers will not be surprised to find that Americans tend to dislike "welfare" (understood as cash assistance to the able-bodied poor) and distrust welfare recipients. The intriguing premise of this book, however, is that such negative attitudes must be understood and ultimately explained as anomalies. Contrary to conventional wisdom, Americans generally do not reject social provision as a violation of liberal individualist values or as a threat to their economic self-interest. By and large, they endorse efforts to assist the poor and support the modern welfare state. Most Americans say they want government to do more for the poor and are willing to pay higher taxes to help those in need. They tend to support nonuniversal programs targeted at poor people, and their commitment to public aid does not flag when economic hard times might be expected to curtail generosity.

Why, then, does welfare evoke such deep hostility? In part, Gilens suggests, individualist values shape moral distinctions between the deserving and undeserving poor: American support for public aid tends to wither when recipients are perceived as lacking a commitment to hard work and personal responsibility. Viewed in this light, the question of why Americans hate welfare must be recast as the question of why welfare recipients, virtually alone among the beneficiaries of social programs, are seen as undeserving freeloaders. The brief answer, elaborated throughout the book, is that white Americans mistakenly believe that most welfare recipients are black and that black people lack sufficient commitment to the work ethic.

Gilens's careful dissection of how and why racial beliefs have come to exert so much influence over welfare attitudes is a first-rate piece of political analysis. Despite dramatic changes in racial attitudes over the past forty years, Gilens demonstrates that the old stereotype of black laziness persists. Drawing on survey data and a clever survey experiment, he also shows that this stereotype leads many whites to view welfare recipients as undeserving, withdraw support from welfare spending, and prefer get-tough approaches to welfare provision. By focusing tightly on the stereotype of black laziness, Gilens cuts a distinctive (and very productive) path between those who dismiss the importance of race and those who emphasize more global orientations, such as antiblack prejudice or the defense of group interests. In addition, he raises the critical question of how racial stereotypes and images of the poor have become so intertwined in the public

Gilens provides a rarity even among very good studies of public opinion: an empirically grounded historical account of the political and cultural forces that have shaped contemporary attitudes. Based on a content analysis of major newsmagazines (1950–92), Gilens concludes that a potent tie between race and poverty was forged in the mid-1960s against a backdrop of black northern migration, increased welfare participation, a civil rights movement demanding economic equality, and the turbulence of urban riots. In contrast to earlier periods in which black poverty received little attention, "from 1967 through 1992, blacks averaged 57 percent of the poor people pictured in [poverty stories]—

about twice the true proportion of blacks among the nation's poor" (p. 114). Since the 1960s, pictures of whites are significantly more likely to accompany sympathetic poverty stories; pictures of African Americans predominate in periods of hostility toward welfare and in stories that are less sympathetic toward the poor or focus on more stigmatized subgroups of the poor.

Although Gilens introduces all the proper caveats regarding causation, the final chapters of the book offer a variety of good reasons to suspect that decades of systematically biased media images have had important political consequences. Gilens first turns to psychology for insight into how media images and racial stereotypes influence public responses to poverty, and he then reviews policy analyses to show that welfare provision follows a racial pattern in precisely those programs that the public links to African Americans. The book concludes with some insightful reflections on contemporary welfare reform and the future of welfare provision in the United States.

As in any book, some issues receive less attention than they perhaps deserve. Gender, for example, rarely enters into the analysis. This omission strikes me as important, given the prominence of sexual, reproductive, and familial issues in welfare discourse. Stereotypes of poor black women extend beyond laziness to include a variety of equally stigmatized behaviors. By devoting more attention to these issues, as well as the ways that work expectations for women have varied across racial groups and over time, I suspect that Gilens might have strengthened his analysis of how racial stereotypes fuel perceptions that welfare recipients are morally undeserving.

To focus too much on this omission, however, would be a mistake. Why Americans Hate Welfare is an extraordinarily good piece of scholarship. Researchers will find much to admire in Gilens's skillful analysis, careful attention to problems of inference, and efforts to address squarely alternative explanations. Teachers should take note that this book's accessible style, clear primers on theory and previous research, and wide range of thought-provoking claims make it ideal for assignment in undergraduate courses. Carefully researched and cogently argued, this book should be essential reading for scholars in a variety of fields.

Organizational Report Cards. By William T. Gormley, Jr., and David L. Weimer. Cambridge, MA: Harvard University Press, 1999. 272p. \$39.95.

B. Guy Peters, University of Pittsburgh

Despite all the changes implemented within the public sector during the past several decades, accountability remains the central political question for public administration. Gormley and Weimer identify an important instrument for accountability that has gained prominence over the past few years and demonstrate its potential effects on management and policy. The organizational report card compares the performance of one organization with that of others doing the same or similar tasks. The information can then be used to improve the organization, either by changes in internal management or through external pressures from clients, the public, and legislatures. In general these report cards are made public and can be the impetus for political debates on the performance of the public sector.

The authors do an excellent job of isolating the ways in which report cards have been developed and used in a number of policy areas in the United States. They focus primarily on health care and education, especially the ways in

which schools and hospitals are assessed, but also examine such areas as job training and environmental policy. They point out the difficulties of measuring many tasks in the public sector and of attributing differences in performance—especially for final policy outcomes—to the actions of individual organizations. The authors are also sensitive to the increasing role of private and third-sector organizations in providing public services and to the even more tenuous linkages that may exist for performance in those settings.

Despite the many virtues of the book, a number of questions are not addressed adequately. To some extent these flow from the failure to anchor the analysis and findings in the burgeoning literature on performance and quality in government. As the administrative reforms initiated during the 1980s become more institutionalized, they appear to be consolidating around the issues of measurement and how to attribute success and failure to individual organizations (see Christopher Pollitt and Geert Bouckaert, Public Management Reform: A Comparative Analysis, 2000). These—and especially the measurement issue—are touched on too lightly here. Furthermore, the relationship of policy and program design to individual organizational performance is largely dismissed, which means there is more focus on management than on the larger array of factors that may produce different outcomes.

Without an anchor in the literature, the discussion appears rather parochial. Perhaps more than any other country, the United Kingdom (Christopher Hood, Regulation Inside Government: Waste Watchers, Quality Police and Sleaze-Busters, 1999) uses report cards and other means of rating the performance of public organizations, but that experience is hardly referenced at all. Beginning at least with the Major government and the Citizen's Charter (in reality a consumer's charter for public programs), there has been substantial emphasis on measuring performance and using that information to improve the quality of programs. This has increased under the Labour government, as organizations are "named and blamed" for poor performance.

Not enough emphasis is given to the role of politics and political forces in the construction and use of rating instruments. Most of the issues raised by Gormley and Weimer, for example, stress the technical aspects of implementing reporting systems rather than their political ramifications. There is relatively little discussion of how these indicators of performance feed back into the policy process, although the social construction of performance seems to be a crucial aspect of the politics surrounding contemporary governing. Likewise, little attention is given to other changes occurring in the same policy areas. For example, at the same time that report cards are becoming important as measures of accountability for education, such initiatives as vouchers and charter schools are reducing direct public sector control over education. This apparent contradiction, and others like it, would be extremely useful to explore, but this volume does not do so.

Performance and quality in the public sector are not only crucial elements in restoring public confidence but also are important components of institutional politics. The Government Performance and Results Act, for example, tends to shift power toward Congress and away from the president. Likewise, the Labour government's Best Value program in the United Kingdom tends to centralize power in London (Paul Gosling, "An Inspector Calls." Public Funance 24 [March 1999]: 5–9) and may substitute political judgments for professional judgments. Furthermore, report cards to an important extent reshape the nature of program accountability. Accountability becomes more populist, but it also becomes more focused on average performance within the

organization rather than exceptional events that can be used to embarrass political leaders. The shift has important political implications that are not explored sufficiently in this book.

Gormley and Weimer offer an extremely useful discussion of organizational report cards and how they can be employed in the public sector. Their research is impressive, and the writing is exceptionally lucid. The crucial missing element is the political dimension of this rating instrument and the way the information is fed back into the policymaking and political process.

Something Within: Religion in African American Political Activism. By Fredrick C. Harris. Oxford: Oxford University Press, 1999. 227p. \$35.00.

Allison Calhoun-Brown, Georgia State University

Within the study of African American politics there has been a debate over whether religion is the opiate or the inspiration for political activism. Those who suggest that it is the opiate focus on the otherworldly nature of much of black religiosity. Those who suggest that religion is the inspiration focus on the institutional strength of black churches and the centrality of black ministers in the African American community. Something Within moves beyond this debate by considering both religion and political activism to be multidimensional constructs. Instead of focusing only on churches or the political influence of ministers, the book highlights the complexity of the relationship between religion and politics among blacks by exploring the ways that both individual and organizational religiosity can serve as important resources for various aspects of political mobilization.

Although the multidimensionality of religion has been appreciated by religion and politics scholars for many years, this understanding has rarely been applied to studies of African American politics, which has resulted in the simplistic kind of either/or thinking about religion and politics in the black community that is reflected in the opiate-inspiration debate. The literature has not significantly informed this debate because much of its emphasis has been on the important and notable differences among various faith traditions instead of the myriad ways that different types of religiosity can affect politics within a faith tradition. Using both qualitative and quantitative methods, Harris does an excellent job of addressing these omissions by exploring how religion can act separately as an organizational, psychological, and cultural resource in the political mobilization of the black community and how these religious resources can have differing effects depending on both the structure of political opportunities and the types of political activities involved.

Something Within makes a number of important contributions. It offers a theoretically rich framework for studying religion and political behavior among blacks, which has been sorely lacking in many studies of this type. Harris does not provide the standard "civil rights movement" treatment of the intersection of race, religion, and politics, which highlights the organizational influence of the church as an institution or focuses at the elite level on ministers as charismatic leaders. Instead, he concentrates on how individuals are motivated to participate politically through religion. Although the research confirms that religious institutions within the African American community play an important role in facilitating black political mobilization by providing such things as meeting facilities, access to communication networks, political forums, endorsements, and fund raising, it

also establishes that the effect of religiously based resources extends far beyond these.

Harris points out that religion works as an important political resource both through and independent of black churches. Internal religiosity or private devotionalism enhances significantly the psychological resources associated with political participation, including religiously inspired political efficacy and interest in politics. One of the most significant political effects occurring through black churches as organizations is the opportunity for involvement that they provide. Those who attend church are likely to vote, but those who are active in church work are also likely to engage in many other forms of community-oriented collective action. Harris also stresses that the "mass response to mobilization is more complex than the psychologically and organizationally centered models of activism convey" (p. 136). The analysis adds to these models the importance of religious culture in explaining how political actors are able to construct meaning and frame individual and collective political actions.

Another major contribution of this book is that it incorporates the literature in such a way that it improves our understanding not only of African American politics but also of the importance of religion in American politics. Harris is particularly insightful with regard to how churches as voluntary associations influence the development of civic culture. In Almond and Verba's classic work (The Civic Culture, 1963) religion was not specifically identified as being significant to the creation of civic culture, and thus the civic dimensions of religion went largely unexamined. Yet, as Harris explains, "one would expect the religious dynamics of civic associations to stimulate citizen activism by giving church members the opportunity to learn and practice civic skills through their religious institutions. Thus, as thriving components of civil society, religious institutions—and the legitimizing values they promulgate—should complement civic culture in the United States" (p. 38). This research suggests system-supporting linkages among religion, civil religion, and civic

System support describes only part of Harris's theory of the role of religion as a political resource. History and much of the social movement literature clearly highlight the integral role of black churches and religious culture in encouraging people to challenge racial injustice. Black religion affirmed black people in times when the social, political, and economic system in the United States tried to dehumanize and demotivate them. Religion provided a means for blacks to challenge their marginality in society. Harris's theory of religion as a political resource is novel in that it incorporates both the system supporting and system opposing components of the black religious experience. He calls the dualistic orientation of the culture and institutions of dominated groups an "oppositional civic culture." Simultaneously, religious institutions have helped "develop positive orientations to the civic order" and provided "African Americans with material resources and oppositional dispositions to challenge their marginality through modes of action and thought that call for inclusion in the political system instead of exclusion from the polity" (p. 40). This finding highlights Harris's point about the need for a multidimensional approach to the study of both religion and political action because of the need to identify which social "norms and institutions lead to loyalty to the polity and reformist opposition and which norms and institutions undermine civic loyalty" (p. 68).

One of the most interesting discussions examines how the religiously based oppositional civic culture has had both positive and negative consequences in African American politics and society. Although it has provided the means to

resist racial oppression and has provided support for the civic order, its patriarchal nature, autocratic structure, and theocratic norms can undermine democratic processes. Harris's chapter on religion and gender in African American political life is particularly perceptive on these points.

Finally, this book is a fine example of how ethnographic and quantitative research methods can be combined to tell a full, rich story. Using multiple methods and multiple data sources, Harris writes a highly academic, theoretically insightful book that is also an interesting read. In the process he successfully reveals much more about the nature and complexity of the relationship between religion and politics in the African American community than has been appreciated by scholars before.

Campaign Talk: Why Elections Are Good for Us. By Roderick P. Hart. Princeton, NJ: Princeton University Press, 2000. 328p. \$29.95.

Kelly D. Patterson, Brigham Young University

The United States has just concluded another presidential nominating season. Judging from television ratings for the conventions, comments of pundits, and public opinion polls, America's utter disdain for presidential campaigns seems to be in full swing. Amid all the criticism and apathy, I had the distinct pleasure of reading this book. It mounts a vigorous defense of campaigns and the language used to conduct them. It undertakes this defense with an impressive array of data and theory and makes an expansive argument about the important functions performed by modern presidential campaigns.

The book relies on a unique source of data. As part of the Campaign Mapping Project, Hart and his project codirector, Kathleen Hall Jamieson, have performed the herculean task of collecting the campaign speeches of presidential candidates, news coverage, and letters to the editor written by average citizens. Most of the material is for the campaigns between 1948 and 1996. With a powerful computer program (DICTION) that analyzes the types and amount of words, Hart explores the language used by presidential candidates, reporters, campaign ads, and the citizens who express their opinions about politics. The result is a large data set that reflects the ways in which different components of a presidential campaign use language to communicate with one another.

The analysis of language is perhaps the most controversial aspect of Hart's project. The DICTION program breaks the transcripts into 500-word segments and then counts the frequency with which particular words occur. The program also segments the language into five main variables: certainty, optimism, activity, realism, and commonality. The research then establishes comparisons between the various participants in campaigns and how each uses language along those variables over time. Critics may scoff that a computer cannot capture the subtleties of language and context and that mere quantification misses the meaning conveyed by campaign' communications. Hart anticipates such criticisms and moves the reader easily through the logic of his research design and the assumptions it makes. Certainly, a computer count does miss some aspects, but it does not miss all. Indeed, very few measures of campaign communication are perfect (I am not aware of any that are). Those who study elections know that tradeoffs must be made when constructing measures that purport to explain and understand the effects of campaign communications. It is fairly easy to assess the author's

assumptions about the measures and the analysis because Hart clearly confronts the limitations of the design.

The findings detailed in the book (too many to list in a short review) can be either heartening or sobering, depending on one's perspective; all are interesting. For example, Hart reports that various themes (e.g., God, country) have been stressed consistently in politics since 1948. He also finds that political speech is less certain than it was in 1948. Voters, politicians, and the press are all more likely to use a language that conveys less assurance about what to do and how to do it. He also finds that the language used by all three actors is increasingly personal. It is an age in which a presidential candidate will answer the question: "Boxers or briefs?" Hart provides stark confirmation that the United States has clearly embarked on a new era in politics. In comparing the voices of politicians to those of the press and the people, Hart finds that "candidates address political initiatives, the press concentrates on political actors, and the electorate emphasizes political communities" (p. 202). These findings are not necessarily unexpected, but they are noteworthy because of the role that each entity plays in a campaign. The differences in voice endure over time, which ensures that campaigns provide the country with a conversation about the type of leaders who can provide solutions to problems that individuals find the most relevant to their communi-

There are two minor points with which a student of campaigns may want to quibble. First, the book does not try to establish a direct link between campaign rhetoric and its specific effects on public opinion or some other part of the political system. Hart seeks to identify the voice of the politicians, the press, and the people and how those voices have evolved over time. It is not an attempt to assess systematically the extent to which these changes may have precipitated effects in some other arena (e.g., legislation, shifts in public opinion, party fortunes). Second, the defense of campaigns at the end of the book applies mainly to the presidential race. Congressional elections, specifically those for the House, might not benefit from Hart's defense. Many congressional elections suffer from an acute lack of competitiveness, whereas presidential elections always have two strong candidates who establish voices and emphasize themes that they hope will resonate with voters. Congressional elections often have only one significant candidate who seeks to have a conversation with the electorate, and they rarely receive the same kind of media coverage as the presidential race.

The best that can be said about any book is that it is thought provoking. This book certainly merits such a description. At a time when so many segments of American society question the value of political campaigns, often on dubious grounds, Hart provides a thorough and cogent defense of presidential campaigns and the rhetoric they spawn. His theoretical insights range over a variety of topics and raise broad questions about democracy and culture. Perhaps the book appealed to me because I read it in the heat of a presidential campaign. I found it easy and helpful to apply the categories developed in the book to the political spectacle I witnessed on the news. Yet, Hart raises questions about political campaigns that endure well beyond the campaign season. Students of campaigns, political pundits, and political consultants would all benefit from reading this book.

Presidential Greatness. By Marc Landy and Sidney M. Milkis. Lawrence: University of Kansas Press, 2000. 278p. \$34.95.

Lane Crothers, Illinois State University

This work is part of a broad tradition that addresses a central dilemma of democratic leadership: how leaders, especially bold, visionary, "great" leaders, can resolve contemporary crises while protecting the democratic character of the system. After all, leaders can engage in demagoguery, manipulation, and distortion. Alternatively, failed leaders place the political system at risk by not addressing and overcoming the crises of the day. Great democratic leadership means both answering society's needs and empowering the citizens in whose name leaders act.

Landy and Milkis take on this dilemma by first outlining a theory of democratic leadership and then exploring how five great U.S. presidents—Washington, Jefferson, Jackson, Lincoln, and Franklin Roosevelt—embody this model. Presidents are great when they achieve "conservative revolutions" (p. 4): systemic changes that expand and enhance democratic participation while at the same time protecting the stability of the political order. Thus, rather than oversee the collapse of the polity into demagoguery or ungovernability, great presidents resolve crises of the moment in ways that establish new political regimes. Furthermore, these new systems are seen to be inevitably associated with the establishment, expansion, or reorganization of political parties. Parties, according to the authors, are the vehicles through which public interests are structured, aggregated, and expressed in ways that empower both ordinary citizens and leaders while at the same time constraining the abusive potential of great leaders.

The text has several strengths that deserve special note. For example, the authors again draw our attention to the context in which great leaders act. Leadership is not just a trait of personality or a group of behaviors. It is grounded in a dynamic political context that shapes both the possibilities and meanings of leadership acts. Similarly, their argument about the role political parties have played in both empowering citizens and constraining leader abuses is important and innovative. Finally, their assertion, which will be discussed later, that great leadership is impossible after Roosevelt's establishment of the administrative state is stimulating if not entirely persuasive.

The book has weaknesses, however. The chapter on Andrew Jackson is by far the least convincing. For example, given the importance Landy and Milkis place on political parties as agents of presidential greatness, they necessarily focus on the development of the Democratic Party during this period. But most of their discussion focuses on Martin Van Buren, who is the real subject of 10 of the chapter's 33 pages. How Van Buren's unquestionable skill at party building makes Jackson a great president is unclear. Furthermore, on pages 86-8 the authors discuss Jackson's invasion of Florida in 1818-19, but the relation between this event and Jackson's greatness is never established. There is also an extended examination of the Eaton affair (pp. 94-7), a sexual scandal involving a Jackson supporter that occurred in his first term, but this seems to have no other purpose than to explain why Jackson came to trust Van Buren. Again, how this made Jackson a great president is not explained. Those acts that are seen to establish Jackson's leadership-Worcester v. Georgia, nullification, and the National Bank-are covered only in the final one-third of the chapter. Jackson may have been great, but this is not clearly established.

Another weakness lies in the authors' argument that greatness is necessarily related to party. For example, parties

were at best incipient during George Washington's time in office, so his greatness was necessarily established beyond the institutions of party. Party may be a factor in greatness, but it cannot be the whole explanation. On a related note, the authors' assertion that greatness is impossible after Roosevelt's establishment of the administrative state is unpersuasive. In their view, the possibility of presidential greatness has passed because parties no longer serve the mobilization and empowerment functions they once did (p. 198). This argument is unconvincing because (1) no clear standards for who was a great president are ever presented, so it is not clear why no president between Lincoln and Roosevelt was great, and (2) as the authors themselves note (p. 198), it was a longer gap in time between Lincoln and FDR than between FDR and the present. Concluding that presidential greatness has disappeared on the basis of this evidence is weak.

The volume also suffers from a problem common to many studies of great leaders: There is no comparison with failed presidents, many of whom faced the very problems that successor, great presidents were able to resolve. It is one thing to explain that great presidents handled significant problems with skill, but if this success is what qualifies them as great in the first place, it is not a particularly powerful analysis of presidential greatness. A comparative study of why some presidents addressed major crises while others, usually facing the same problems, did not would do much to delineate what factors made the great one great. Similarly, the presidents who follow great leaders almost always struggle to deal with the consequences of the politics their predecessors create; a comparative study of great and not great presidents facing similar contexts would go far to shed light on the shape and meaning of presidential greatness.

On balance, this book is a useful addition to the literature on leadership, democracy, and greatness. Its grounding of leadership in specific political contexts is important. The theory of party and greatness it outlines is deserving of substantial attention and should stimulate much research. Its insistence that democratic leadership must both resolve contemporary crises and empower citizens nicely frames the question of how the practice of leadership can augment, rather than compromise, democracy. Perhaps more important, its limitations can serve as the foundation for more theorizing and applied research. Understanding both why some leaders are great and why most are not in a democratic context is sure to remain a central question in political life.

International Politics and Civil Rights Policies in the United States, 1941–1960. By Azza Salama Layton. Cambridge: Cambridge University Press, 2000. 217p. \$49.95 cloth, \$17.95 paper.

Brenda Gayle Plummer, University of Wisconsin, Madison

This engaging book approaches the dynamic relationship between policymaking and interested publics by analyzing the issues from which policies arise in a specific temporal setting: Cold War America of the Truman and Eisenhower eras. The mid-twentieth-century drive for civil rights for African Americans provides a unique opportunity to examine policy formation in the context of both rapid social change and fundamental debate about the national interest. It is gratifying to know that more behavioral scientists are catching up with historians in realizing the salience of race as a factor in international affairs. Although the title suggests a complete examination of the war years, that part of the study is cursory. The work instead highlights the Truman years as the beginning of federal decision making that explicitly acknowledged

the difficulties that racial conflict and segregation posed for the U.S. mission abroad. In this account, the end of the Nazi racialist project and the exigencies of Soviet-American rivalry forced policymakers to oppose discrimination in American life. Later, Eisenhower, no advocate of rocking the boat on race relations, was also forced to recognize the implications of Cold War realities for domestic social practices.

Layton pushes this analysis farther. She avers that the emergence of a federal impetus for desegregation seems to have occurred at an unlikely time. Given the continued hostility to integration evidenced by opinion polls and violent incidents in the South during the late 1940s and early 1950s, what accounts for the weight that Truman assigned to racial reform? As a skilled politician, why would he risk the ire of the South and its entrenched senior representatives in Congress? Eisenhower found himself in a similar position. He came into office vowing not to interfere with the southern way of life, but early in his second term his historic decision to send federal troops to Little Rock reaffirmed the legacy of Reconstruction and reversed 80 years of hands-off policy. The thesis here is that international concerns outweighed domestic factors, including black protest, as reasons for growing governmental support for integration during this era. Those concerns included the possibilities that the Soviet Union would gain an ideological advantage over the United States, and that developing areas awaiting independence would see in U.S. racism reminders of their own anticolonial struggles. Efforts to align future independent states with the West would thus be undermined by Jim Crow.

Primary research in Department of State and other archival documents as well as readings of the foreign press and historical literature provide the empirical foundation for Layton's findings. Her argument is generally convincing but gives too much credit to the Department of State as an active reformer and protagonist. In fact, change was almost as often foisted upon an unwilling Department of State as on recalcitrant southern politicians. Michael L. Krenn (Black Diplomacy: African Americans and the State Department, 1945–1969, 1999) has documented the uphill struggle to integrate the Foreign Service and break down discriminatory practices of U.S. embassies and consulates abroad during this period.

Layton premises this study on a resource mobilization/ political process model. It thus joins the literature that traces fundamental social change to shifting opportunity structures. In this case, the conjunction of profound economic change, the discrediting of sociobiological explanations of race during the war, and the political imperatives brought about by Soviet-American competition made civil rights reform possible. Layton could have exploited opportunity structure dynamics more fully than she did. Political process theory generally perceives the organizational abilities of interest groups and the less well-defined but nonetheless important realm of consciousness as critical elements in effecting change. The author's desire to make the international agenda primary in the shaping of federal responses to civil rights causes her to understate somewhat the complex roles that interest groups played in making the issue relevant to government policymakers. The reader needs a more privileged view behind the scenes of official pronouncements and a clearer picture of how the rapid cultural transitions taking place in American life affected policymakers' perspectives.

The study raises intriguing questions. If racial-ethnic minorities have historically advanced most rapidly during times of war and when the nation faces ideological competition, it will be interesting to see in the future the implications for race relations of the current unchallenged U.S. hegemony. Does America need an external check on its potential for

human rights abuse? Are the swelling minority prison populations, the drive to limit minority access to higher education, and the popular affinity for the death penalty omens of a future in which no accountability is asked and none given?

International Politics and Civil Rights Policies in the United States is a fine introduction to the growing literature on the salience of race in the intersection of foreign and domestic affairs. Its concise format and clear language recommend it for instruction in university political science, sociology, and history courses.

Eco-Wars: Political Campaigns and Social Movements. By Ronald T. Libby. New York: Columbia University Press, 1999. 254p. \$45.00 cloth, \$21.50 paper.

Voices and Echoes for the Environment. By Ronald G. Shaiko. New York: Columbia University Press, 1999. 299p. \$49.50 cloth, \$21.00 paper.

George A. Gonzalez, University of Miami

During the 1960s and early 1970s, mass social movements developed that sought to circumvent the major political parties and directly affect the formulation and implementation of public policies. Among the most important was the environmental movement. Libby and Shaiko both seek to elucidate our understanding of the ability of this movement, and the interest groups that it spawned, to affect public policy development in the contemporary period. Shaiko, however, takes an appropriately skeptical approach, whereas Libby's view is more sanguine and as a result less probing.

The focus of Voices and Echoes for the Environment is the relationship between the leadership of environmental interest groups and their members. Shaiko specifically seeks to understand the ability of leaders and membership to communicate on policy questions. This requires a dual assessment. First, Shaiko analyzes the extent to which interest group leaders solicit members' opinion on various policy questions and the extent to which institutional mechanisms within these organizations allow members to communicate their policy preferences to the leadership. Second, he analyzes the ability and success of environmental interest groups to mobilize the membership on policy questions. Shaiko uses data from five environmental interest groups to gain an understanding of the relationship between leaders and members: Sierra Club (SC), The Wilderness Society (TWS), National Wildlife Federation (NWF), Environmental Defense Fund (EDF), and Environmental Action (EA). The most significant conclusion drawn from the analysis is that leaders tend to prioritize organizational maintenance over political advocacy. A similar argument is made by Mark Dowie in Losing Ground (1995). Shaiko, however, brings theoretical and empirical rigor in contrast to Dowie's often polemical tone.

According to Shaiko, a key reason for the increasing emphasis on organizational maintenance is the public interest group milieu. During the last thirty years there has been substantial growth in the number of public interest organizations competing for a limited pool of individuals with the inclination and disposable income to pay membership fees. Environmental interest group leaders, to varying degrees, have come to view their members more as an economic constituency and less as a political constituency. This is best exemplified by two trends: the hiring of individuals outside the environmental movement to be leaders for the specific purpose of organizational maintenance, and the offering of incentives to join or renew memberships, such as credit cards, posters, calendars, and magazine subscriptions. Moreover, Shaiko's analysis demonstrates that environmental interest

group members tend to join these organizations largely for these incentives and less for reasons related to political advocacy and public policy.

Among the groups Shaiko examines in detail, the EDF most overtly takes the position that its membership is primarily, if not exclusively, an economic resource for its leadership. The NWF does not openly embrace that view, but it nonetheless limits its political communications to members for fear of alienating existing and potential dues-paying members. The NWF by far has the largest membership among environmental groups (p. 41). EA is the most active in seeking to mobilize its membership to effect political change. Significantly, EA historically maintained a relatively small membership base, and in 1996 it went defunct due to insufficient financial resources. The SC and TWS make more concerted efforts to communicate to the membership on political issues than do either the EDF or the NWF. In addition, the SC maintains an institutional mechanism to allow members to communicate to the group's leaders on 188ues of public policy. Shaiko nonetheless concludes that in the contemporary period the leadership of these groups give higher priority to organizational maintenance than political

Shaiko has produced an important book that should be read and carefully examined by all scholars interested in environmental politics and policy. This work has one significant shortcoming that may limit its appeal, however. This relates to the way the book is laid out. Shaiko began this project as his dissertation, which was completed more than ten years ago. The book reads like he began his research with the sole objective of describing the relationship between the organizational elites of environmental interest groups and the mass membership, and he only came to his central and most significant argument years after much of the data were collected and analyzed. Shaiko only directly treats his argument about organizational maintenance versus political advocacy at the beginning and at the end of the book. Therefore, I often found myself asking how the data and analysis related to and supported the author's central thesis. Although less systematic and rigorous, Dowie's book will probably remain the seminal work on how the professionalization and bureaucratization of environmental interest groups have enervated U.S. environmental politics and the environmental social movement.

Whereas Shaiko makes a concerted and fruitful effort to clarify the complex relationship between leadership and members, Ronald Libby simply assumes that the membership is a resource that is readily mobilized for political purposes. The core of *Eco-Wars* is the description of five public policy issues that putatively involved social movements: (1) the controversy surrounding the 1993 FDA approval of bovine somatotropin (BST) to increase milk production from cows, (2) a failed 1988 Massachusetts initiative requiring the strict regulation of the management of farm animals, (3) a failed 1990 California initiative requiring the strict regulation of the state's agriculture and timber industries, (4) a 1994 failed initiative sponsored by Philip Morris to weaken many of California's local antismoking laws; and (5) the failed effort in the mid-1990s to reauthorize the Endangered Species Act.

My use of "putatively" is purposeful, because Libby does not put forward a method or means to assess the existence of a social movement. Without that it becomes difficult for the reader to determine whether a social movement is actually active in the policy issues he treats. In lieu of a method to verify directly the existence of a social movement, Libby uses the activity of what he terms "social movement organizations" (SMOs) as an indicator of social movement behavior.

His examples of an SMO are the Natural Resources Defense Council and the Sierra Club. As Shaiko's work aptly demonstrates, the assumption that such organizations represent and/or mobilize social movements is extremely dubious.

Moreover, it is unclear why Libby chose his case studies. According to my reading, broadly based movements existed in only two of his cases: the Philip Morris initiative and the reauthorization of the Endangered Species Act. The other three cases appear to involve only particular interest groups seeking to influence public policy through initiatives or the legislative process.

Also, Libby's use of the label "expressive" to identify certain interest groups is somewhat perplexing. It appears that an expressive interest group is simply one that takes a leading role on certain public policy issues, whereas groups that are only supportive earn the label of SMO. These labels are not analytically useful, and the label of SMO again serves to obfuscate.

In conclusion, the strength of Libby's book is his comprehensive and informative treatment of the case studies. In particular, his description of the events surrounding the failed attempt to reauthorize the Endangered Species Act is original and illuminating. He also draws some interesting generalizations about the tactics used by interest groups as they seek to influence policy formulation. Nevertheless, *Eco-Wars* only makes a limited contribution to our general understanding of interest groups, social movements, or the political influence of either of these entities.

Stuck in Neutral: Business and the Politics of Human Capital Investment Policy. By Cathie Jo Martin. Princeton, NJ: Princeton University Press, 2000. 262p. \$49.50 cloth, \$19.95 paper.

Sandra L. Suárez, Temple University

Cathie Jo Martin makes a novel contribution to our understanding of business preferences and political behavior. She argues that a considerable number of American firms strongly support "human capital investment" initiatives, such as national health care, training, child care, and family leave policies. Large employers' support for these policies, however, has failed to translate into legislative support. In order to understand why big business has not been able to promote the enactment of human resource policies, Martin proposes an institutional analysis of corporate preferences. In so doing, she opens the black box of business in order to understand its public policy interests.

Martin's explanation of business behavior challenges the interest-group and class-based approaches, which generally assume that economic motivations offer a complete explanation of business preferences and political activity. Martin points out that corporate preferences are problematic. Firms operate in an uncertain economic and political environment, and answers to important questions are not obvious to corporate managers. Still, to argue that there is a great deal of corporate support for national social policies goes against the laissez-faire thinking that is hegemonic in corporate circles and is contrary to the perception that big business has been responsible for the limited scope of welfare policies in the United States. Hence, it is important to offer a more nuanced understanding of corporate preferences.

Martin argues that business managers' support of human capital investment policies depends on their "corporate policy capacities," which she defines as the organizational facilities for "gathering, processing and disseminating technical arguments about social initiatives" (p. 11). Corporate policy

capacities have three components: private policy professionals and their position in the corporate structure, which may be important influences to corporate managers and may change their attitudes toward social policies; participation in business associations, which may also shape corporate preferences; and policy legacies in the form of failed private attempts, which may increase managers' support for government intervention, especially if the issue at hand can be linked to other issues of importance to the firm.

The book contains persuasive empirical evidence in the form of case studies and quantitative data. Martin conducted a large number of interviews with business managers, policy experts, and public sector employees. In one case studyhealth care reform—she examines the significance of institutional factors in shaping firm preferences regarding Clinton's national health reform initiative between 1993 and 1995. Martin finds that economic concerns led many firms to become interested in health care reform, but firms that participated in groups seeking collective solutions or firms with government affairs offices in Washington were more likely to support employer mandates than firms that obtained their information from health insurers, for example. Martin's qualitative analysis convincingly demonstrates that such institutional factors as corporate structures and group memberships are important determinants of the political position of a firm. The quantitative analysis of the data obtained from 59 Fortune manufacturing and service firms is somewhat less persuasive, although still informative. For example, she operationalized internal policy expertise depending on "whether or not the company had a government affairs office in Washington, D.C." (p. 104). If, as she says, such institutional factors as the position of a policy expert within the firm are important, having a Washington office in and of itself does not necessarily imply expertise in all policy issues.

In addition to an analysis of business preferences, Martin provides a sound explanation for why and how certain social issues become more salient for firms than others. In particular, she examines how corporate managers have dealt with training and work-family issues. She finds that training typically (1) fell under the jurisdiction of human resource departments, which enjoy a close relationship with the companies' own government affairs departments; (2) was associated with education reform; and (3) was deliberated at the National Alliance for Business, which also promoted legislative action on the issue. By contrast, a work-family issue such as child care (1) was dealt with by newer departments or by outsiders to the firm, (2) was associated with the feminist movement, and (3) could not count with a national organization bringing together business and government to promote a common position. Hence, child care issues have not been altogether neglected by business, but they have been tackled at the community and not the national level.

After examining preference formation and issue saliency, Martin explores why big business support for human capital investment policies (as measured by polling and interview data) did not translate into firms' collective participation in the legislative process. She finds that the corporate policy capacity of big business varied a great deal among training, health, and work-family issues, which had important consequences for the political outcomes of these initiatives during the Clinton administration. Martin explains that one reason most of these social initiatives failed was that small firms, which cannot afford to maintain an individual presence in Washington and are forced to rely on their representative associations, were able to communicate their opposition to social policies more effectively than big business was able to convey its support.

Martin's analysis fills a theoretical void in the interest group literature and invites further research to establish a dialogue with other social scientists concerned with preference formation, especially organizational sociologists. Her case studies convincingly demonstrate that the way business preferences are formed can have important implications for the success or failure of social policy initiatives in the United States. Plotke has shown that when big business is able to develop a common position it has an enormous capacity to influence the political discourse (David Plotke, "The Political Mobilization of Business," in Mark P. Petracca, ed., The Politics of Interests, 1992). Martin persuasively shows how difficult it is for big business in the United States to adopt common positions and formulate a political strategy in the realm of social policy. Stuck in Neutral is a must read for scholars of welfare state politics, policymaking in the United States and abroad, and business and government relations at the local, state, and federal level.

Controlling Technocracy: Citizen Rationality and the NIMBY Syndrome. By Gregory E. McAvoy. Washington, DC: Georgetown University Press, 1999. 184p. \$55.00 cloth, \$18.95 paper.

Brent S. Steel, Oregon State University

The emergence of the United States as a postindustrial society has led to an increasing array of social and political problems that confound government's ability to make and implement policy decisions. One is what may be termed the "democracy and technocracy quandary." The United States faces many policy problems that are highly technical and increasingly scientific in nature, including genetically engineered foods, habitat restoration for dwindling salmon runs, and the regulation of second-hand tobacco smoke in public settings. At the same time, the United States is a democratic system that has experienced over the past several decades a noticeable growth in distrust of government and increasing public demands for citizen involvement in governance, especially in the environmental policy arens

The concern is that the relationship between participation (democracy) and scientific expertise (technocracy) is mutually exclusive. On the one hand, placing too much emphasis on science and expertise as the ultimate determinants of policy outcomes risks the erosion of democracy. On the other hand, too much democracy (i.e., direct involvement of citizens in policymaking and implementation) may relegate technical and scientific information to a peripheral role and increase the probability that complex problems will either be ignored or addressed in a suboptimal manner.

Gregory McAvoy provides a well-written and timely investigation of the tension between technocracy and democracy in the context of hazardous waste policymaking. Hazardous waste siting involves complex issues in which substantial amounts of technical and scientific information are critical to the decision-making process. Identifying an acceptable location to store and/or process hazardous waste often leads to the not-in-my-backyard (NIMBY) syndrome from potentially affected communities. The book presents an interesting case study of two northern Minnesota counties (Koochiching and Red Lake), where affected communities and citizens challenged the state's siting decision.

The book is well grounded in the relevant literature and

offers a useful, albeit very brief, theoretical framework that can be used to analyze other policy processes in which the NIMBY syndrome is prevalent. In addition, a major strength of the book is its reliance on both qualitative and quantitative data to investigate elite and citizen motivations and preferences concerning waste siting policy. Elite and citizen interviews as well as public opinion surveys provide strong support for the arguments presented. McAvoy also is careful to identify any potentially unique cultural and political features of Minnesota that may bias the results. Nevertheless, he makes a convincing argument that his case study is applicable to other environmental policy processes involving complex technical expertise.

McAvoy challenges the notion that policy "experts" and "elites" should be accorded a privileged place in the policy process and that citizens are "overly emotional and self-serving, and therefore unable to participate in politics in a way that will allow society to achieve its best interest" (p. 90). He argues that citizen participation in the policy process is desirable for two reasons. First, it provides "legitimacy to democratic governance"; second, it leads to good policymaking because it "requires all participants to justify their technical assumptions and implicit and explicit value judgments" (p. 141). He further argues that democratic decision making should be seen as an important feature of managing complex and highly technical policy issues, such as hazardous waste siting.

This book is especially timely because of recent developments in the environmental and natural resource management arenas. The growing embrace of ecosystem management (EM) in the United States elevates the role of science as a tool for understanding environmental problems and policy issues. Yet, central to EM efforts are calls for more innovative, decentralized institutional arrangements that require government managers at the regional or local level to integrate not only the interests of other agencies that have adjacent jurisdictional and policy responsibilities but also the concerns of private citizens. EM acknowledges the limits of top-down regulatory approaches to environmental and natural resource management and recognizes that more effective alternatives require complex, collaborative partnerships among diverse government, civic, and business actors at the state/provincial and local levels. In this light, McAvoy's defense of citizen participation in the hazardous waste context has broader application to other developments in environmental and natural resource policy processes.

One aspect of the book that could have been further developed is the level of knowledge citizens actually have about the risks associated with hazardous waste and its proper disposal. Including some indicators of policy-relevant knowledge in the citizen surveys would have strengthened the multivariate analyses and potentially McAvoy's argument that citizens do have the capacity to understand and participate in complex policy issues and that the NIMBY syndrome is not necessarily the product of emotions and selfishness.

Overall this is an interesting and clearly written book that makes an important contribution to our understanding of how citizens can mobilize and influence environmental policy processes. Given the content, length, and price of the paper-back version, it would make an excellent supplemental text for senior or graduate courses in environmental politics and policy.

A Unified Theory of Voting: Directional and Proximity Spatial Models. By Samuel Merrill III and Bernard Grofman. New York: Cambridge University Press, 1999. 213p. \$54.95 cloth, \$19.95 paper.

Keith T. Poole, University of Houston

A Unified Theory of Voting is a "must read" for anyone wishing to stay current with the controversies in modern spatial theory. The book is somewhat uneven in exposition, but Merrill and Grofman do an excellent job of developing an elegant synthesis of several important spatial models and explaining how each model works. Part 1 is concerned with spatial models of voter behavior, and Part 2 covers spatial models of candidate/party behavior and strategy.

In the classic Downsian spatial model, citizens and politicians are assumed to be points in a multidimensional policy space. When a citizen votes, she chooses the politician closest to her in the policy space. This model has come under strong attack during the past 13 years from the directional theory of voting developed by George Rabinowitz. In contrast to the Downsian model, the directional model states that a voter chooses the politician who will change policy in her direction. She bases her voting decision upon direction, not distance. For example, in a simple one-dimensional world the citizen could be just to the right of zero (the "neutral point") with two candidates, one just a hair to the left of zero and another to the right of zero. She would vote for the candidate in her direction (right), even though she is closer to the left candidate. In its original form, Rabinowitz's theory required a neutral point and a "region of unacceptability"; that is, a region so distant from the neutral point that any candidate in the region is regarded as an extremist and thus cannot win an election. Needless to say, these two restrictions are a great source of controversy.

The publication of Rabinowitz's directional theory in 1989 touched off a lively debate with proponents of the proximity model, and both sides offered competing analyses of voting data from a variety of countries. Merrill and Grofman do an excellent job of synthesizing this literature and add their own original contributions to the debate. In particular, in Part 1 (chaps. 1–3) they show how the classical Downsian model and the directional model can be combined into a unified framework that can be empirically tested. The exposition is very clear, and these chapters only require an understanding of some very simple properties of vectors. This portion of the book could be used in an undergraduate course to introduce students to the basics of spatial theory.

Chapters 4-7 of Part 1 show various empirical tests of the two models. This requires a bit more sophistication on the part of the reader, but anyone familiar with the basics of OLS and probit/logit should find it interesting. The bottom-line findings are that voter choice appears to be a mix of directional and proximity components, and this mix varies with the type of candidate (challenger or incumbent). The key empirical result is that voters appear to respond to candidates who offer policies in their direction but reject candidates distant from themselves.

The mixed model solves the problem of the region of unacceptability, and Merrill and Grofman argue that it also explains the success of "moderately extreme" political parties. It has been apparent for some time that political parties do not converge as predicted by the Downsian spatial model. Instead, they diverge, but only to the "moderately extreme" region of the policy space. Merrill and Grofman show that their mixed model works well for a variety of countries and electoral systems, but they confine themselves to showing these empirical regularities and do not address why the

model works so well. They frankly state that "we are not really ready to distinguish between interpretations of our unified model" (p. 10). I am sympathetic, but this is the big question raised by this book. Provided that further empirical tests support their unified model, what model of individual behavior would generate this choice behavior?

Part 2 (chaps. 8-11) deals with the choice behavior of political parties. This portion of the book is much more technical and requires a good working knowledge of spatial theory. In addition, the exposition at some points is not very clear. For example, in chapter 8 the authors discuss stars and star angles without any explanation of what they are (graphs of median lines for electorates, as clearly defined in an appendix).

Merrill and Grofman show a number of theoretical results for the mixed model that produce political party behavior consistent with the empirical tests of voter behavior. For two-candidate elections in one dimension, the candidates will diverge from the median, and an equilibrium exists. In more than two dimensions, there may be no equilibrium, but there will be a region (a "pseudo-yolk") within which any candidate located there cannot be defeated by a candidate located outside the region. For more than two candidates in one dimension, the candidates will diverge, but neither the proximity nor the directional model necessarily predicts convergence of the candidates. Here, Merrill and Grofman argue that the mixed model is superior to the pure models empirically.

By summarizing and synthesizing the current state of the literature on directional versus proximity spatial models, Merrill and Grofman have moved the debate forward in an important way. Their empirical results for the mixed model raise important questions about the nature of individual choice. What model of individual behavior would generate these results? The debate will be a lively one. Stay tuned.

Black Social Capital: The Politics of School Reform in Baltimore, 1986–1998. By Marion Orr. Lawrence: University Press of Kansas, 1999. 242p. \$35.00 cloth, \$17.95 paper.

John Portz, Northeastern University

School reform has been near the top of the public agenda for more than fifteen years. Federal, state, and local policymakers have launched numerous reform initiatives, ranging from vouchers to high-stakes competency tests. Success remains elusive. Particularly in large cities, where poverty, racial divisions, and fiscal stress heighten the challenge, school reform has had limited effect in raising student achievement. Marion Orr helps us understand why. He offers an informative and well-written case study of recent reform initiatives in Baltimore. He presents a cogent political analysis of reform strategies, such as school-based management and privatization, and also develops and elaborates the concept of social capital as his theoretical framework.

Orr's application of social capital to school reform is an important contribution to urban studies as well as the general political science literature. As developed by Robert Putnam and others, social capital highlights the role of trust, norms, and networks in facilitating coordinated action. Similarly, Orr defines social capital as "an ability to work together to achieve social ends, based on past experiences and attachments, with minimal reliance on direct payments or coercion" (p. 13). As Orr argues, when applied to the education arena, social capital plays a critical role in developing and sustaining essential community support for school reform.

Orr finds social capital theory as currently developed to be

lacking in several respects. Using the insights of an urban regime perspective, he extends the concept in two major ways. First, social capital theory typically emphasizes interpersonal and intragroup bonds and connections that facilitate collective action. Orr argues, however, that such broad policy initiatives as urban school reform require collective effort of a different scale. Fostering greater individual participation in the affairs of a community is insufficient; policy initiatives require intergroup and cross-sector formation of trust and networks of cooperation. In the case of school reform, bonds of trust are needed that span a diverse set of community actors, including teachers, parents, business leaders, community leaders, and elected officials. "A major flaw in the social capital argument is that it does not consider the difficulty in transferring intragroup into intergroup social capital" (p. 10).

Building cross-sector networks is particularly difficult in America's cities, many of which face racial divisions and fiscal stress. In the case of Baltimore, Orr traces the historical development of social capital within the black community. He highlights the role of churches and the civil rights movement in creating a collective capacity among black leaders and the black community in general. With substantial economic and political resources controlled by white elites, however, the critical task becomes cross-sector and intergroup formations of trust and cooperation that include both black and white leaders and organizations. It is here that Baltimore, and many other cities, face a daunting task.

This points to the second way in which Orr extends the use of social capital theory. Typically, it highlights the participation of individuals in community affairs; governmental institutions and political leaders play a limited role. In contrast, Orr's analysis gives particular attention to government and its leaders. He argues that governmental actors and institutions, such as mayors, play an important part in fostering the development of social capital.

In Baltimore, the development of social capital was shaped significantly by government, its leaders, and their practices. Orr describes the emergence of a patronage culture in which blacks received particularistic benefits, such as jobs, from whites in control of city government. As the school department and even general city government came under the control of blacks, patronage remained a factor that limited broader appeals to collective action. Mayors also played a critical role. Kurt Schmoke, elected in 1986, was very active in the school arena and, with mixed success, often sought to build cross-sector support for reform efforts. Orr's discussion of mayoral roles is particularly interesting in light of the recent trend in large cities, such as Chicago, Detroit, and Boston, to give mayors more authority over school affairs.

With this theoretical framework, Orr analyzes the social and political dynamics that stymied or supported major school reform in Baltimore. School-based management, for example, faced entrenched interests, principally school administrators and the teachers' union, that were able to limit its adoption. Efforts by parents and teachers to establish a new school within the system, known as Stadium School, proved more successful in building critical cross-sector alliances. Highlighting the challenges of building bridges to the business community, Orr traces the development of Baltimore Commonwealth and the CollegeBound Foundation, two reform efforts that attempted to tap the resources of business elites. In separate chapters, Orr analyzes the unsuccessful experiment in privatizing the management of nine schools by Educational Alternatives, Inc., and he dissects the more recent consent decree with the State of Maryland that traded additional state monies for greater state oversight of the school district. In each reform experience, Orr highlights the struggle, often unsuccessful, to extend social capital to encompass a broad coalition of community actors.

Black Social Capital makes an important contribution to our understanding of education reform and urban politics. The faults in this book are few. In a couple of instances, the reader is left pondering a point that is treated briefly. For example, Orr details the difficult struggle to open the Stadium School as a within-district charter school, and he then concludes the chapter with a reference to the creation by 1997 of ten schools that appear to be similar. How these ten schools were created is a story that merits additional attention. Notwithstanding such details, Orr's study of Baltimore offers a clear picture of the challenges faced in America's cities as civic leaders and city residents attempt to build networks of cooperation in support of public education.

Citizen Participation in Resource Allocation. By William Simonsen and Mark D. Robbins. Boulder, CO: Westview, 2000. 179p. \$59.00 cloth, \$22.00 paper.

Jeffrey Kraus, Wagner College

Simonsen and Robbins examine Eugene Decisions, an effort to engage citizens in the local decision-making process in Eugene, Oregon. The community participation movement was an outgrowth of the civil rights movement and Lyndon Johnson's War on Poverty. In large urban areas, African Americans and other disenfranchised groups came to believe that local political institutions were, at best, indifferent to their concerns. There were also antipoverty warriors and theoreticians (notably Kenneth Clark) who believed that empowering the poor was essential to breaking the cycle of poverty.

During the 1960s, federally funded community action agencies, local development corporations, "Little City Halls," and decentralized government services constituted the elite response to demands for greater participation in urban areas. In many communities, the activism of these efforts disrupted the established political regimes. As Dennis Judd and Todd Swanstrom (City Politics, 1998, p. 405) observe, shifting city services (and control over those services) from middle-class white ethnic neighborhoods to low-income minority areas was a development that most city governments resisted. In 1967, in response to pressure from mayors, Congress passed the Green Amendment, which required federal funds for community action agencies to be allocated through state and local governments, to ensure that the recipients would not challenge the status quo (Bertram M. Gross and Jeffrey Kraus, "The Political Machine Is Alive and Well," Social Policy 12 [Winter 1982]: 35-47)

During the 1970s, white middle-class residents in suburbs and big city enclaves began seeking more influence over local government decisions. This movement relied on two strategies. The first was the ballot initiative. Beginning with California's Proposition 13, middle-class residents, fed up with paying taxes for services of poor quality or for services that they believed were being consumed by poor (primarily minority) residents in cities, began reining in local governments by limiting their ability to raise taxes. Oregon was another state where this occurred; it adopted Measure 5 in 1990, which limited local property tax levies to 1% of real market values. The second strategy was to increase involvement in grassroots politics. Harry Boyte (The Backyard Revolution, 1980) made the first effort to chronicle this movement

In recent years, there has been even greater disillusionment with government. Many people perceive that elected officials have become beholden to the interest groups that help fund their campaigns (one person, one vote has been supplanted by one dollar, one vote).

In the introduction and first two chapters, Simonsen and Robbins discuss the theoretical and historical context of public administration and contemporary techniques for citizen involvement, as well as the general decline in citizen participation and the concurrent distrust of public officials. For those who lack an understanding of citizen participation efforts, these chapters offer a brief yet comprehensive analysis.

The remaining three chapters focus on Eugene. The goal there was to engage citizens in a dialogue with their elected officials on the city's budget priorities. The "Build Your Own Budget" survey allowed people to articulate their priorities for the community. Participants in the November 1991 survey were informed that the city would face a budget deficit of \$8 million by 1994. They were asked about their support for service cuts, tax increases, or the imposition of user fees.

"When faced with realistic options for service reductions, the overwhelming majority of respondents chose at least some revenue increases" (p. 68). As the authors note, however, these findings are from an "informed public." The uninformed public is less likely to support revenue enhancements. Cuts suggested by survey respondents were in such areas as planning, park maintenance, and building maintenance—not dissimilar to the choices that public officials make when paring budgets: Cut services that do not have an immediate effect on the public.

In chapter 4, the authors test the notion of whether fiscal information and service use influence citizen preferences. They find that the more people know about the costs of government service, the less likely they are to support taxes for services. "Fiscal conservatives who wish to stymie government spending would be well served in this aim by publicizing the true costs of government services. On the other hand, it appears that fiscal liberals wishing to increase spending would do better with their program if the citizenry remained in fiscal ignorance" (p. 108). Of course, this also suggests that fiscal liberals would best be served if people remained estranged from the political process.

The authors report that some people (good citizens) are willing to pay for services that are not individually consumed but that provide a public service, whereas others (private citizens) are more concerned about obtaining the lowest price for individually consumed services and less concerned about collectively consumed services. Of course, this leads to the question of what happens when there are not enough good citizens to support essential collective services.

The authors also raise questions about the "customer service" focus of the Clinton administration's reinventing government initiative. If they are not customers, will taxpayers be willing to pay for services they do not use? The authors seem to have some concerns about this prospect and fear that social services and other programs targeted at the poor will be the "first casualties" of a "privatized government" (p. 111).

In the final chapter, Simonsen and Robbins reflect on what they have found. Ironically, they assert, making a group of citizens participate in the budget process by providing them with financial information means they are less representative of the larger public they are intended to represent. The authors also suggest that citizen perceptions of government are affected by their contacts with it. Do traffic tickets or road construction delays cause a decline in support for government service? Does one's perception that he is a customer of government or is a member of a cooperative affect his view of government?

The authors demur on the issue of whether local governments should use citizen participation processes. They contend they have studied one tool of governance and conclude: "As with any tool; its use to craft something useful relies for its satisfactory expression on those who use it" (p. 123).

There are questions that the authors do not raise or answer. First and foremost, do they believe that the kind of citizen participation exercise undertaken in Eugene (with a population 93% white) is feasible in more heterogeneous communities? Would the model work in New York City? Or does it work only in homogeneous, middle-class, white communities?

In an age when we bowl alone, does it make sense to believe that people will make decisions as if they were part of a "family," the term Mario Cuomo often used to describe what he believed the state polity reflected during his years as governor of New York. The authors accept the premise that more citizen involvement is desirable, but in light of some of their findings regarding the unwillingness of people to pay for services they do not use, this may not lead to positive outcomes. Even if there is an eagerness for enhanced citizen participation, unless we are headed in the direction of an Internet-powered plebiscitary democracy (as suggested by Dick Morris in Vote.com, 1999), we are still going to hold public officials accountable for their actions. Do we really need more participation if it is going to result in policies that fail to take into account the common good? Who knows? Perhaps Mr. Madison had it right back in 1787.

Reaching beyond Race. By Paul M. Sniderman and Edward G. Carmines. Cambridge, MA: Harvard University Press, 1997. 191p. \$22.95 cloth, \$14.95 paper.

Jennifer L. Hochschild, Princeton University

This book is part of a seemingly endless multisided argument among social scientists about the causes and trajectory of white American attitudes toward African Americans. The most prominent claims are, roughly, those of symbolic racism (whites are prejudiced because of a mix of racially innocent moral values and deeply seated racial aversion); group interests (whites are prejudiced because they fear that the advancement of blacks will injure the well-being of whites as a category); social dominance theory (whites are prejudiced because they like being on top); and principled conservatism (most whites are not prejudiced, and prejudice explains little of the opposition to government policies designed to help blacks). The latter view is the least favored among scholars, and it is the view expounded by Sniderman and Carmines.

Reaching beyond Race has two very great strengths that make it essential reading for anyone in the fields of public opinion or race relations. First, it takes people—even conservatives who oppose affirmative action or other policies to promote racial equality—at their word. If a survey respondent says the equivalent of "I'm not prejudiced, but...," Carmines and Sniderman assume that is true unless proven otherwise. "The more closely we listened to expressions like this, the more they seemed to testify not to a wish to cover up opposition to racial equality but to a desire to reaffirm commitment to it" (p. 46). One may reject this view—I coauthored an article that revolves around just such a rejection—but Sniderman and Carmines force us to accept that, in the name of moral symmetry, racial conservatives deserve the same starting point as racial liberals.

The other powerful virtue of Reaching beyond Race is its imaginative and innovative use of experiments within the rigid confines of a survey to tease out meanings and nuances

of responses. These authors (along with several others, such as James Kuklinski) are pioneers in taking advantage of the power of randomization of respondents and systematization of computer software in order to make surveys much more flexible than we imagined they could be a decade ago. Even readers with no interest in racial attitudes, or no tolerance for what sometimes reads as an apologia for white racial complacency, should study this book carefully in order to learn how to push surveys beyond their normally frustrating limits.

The central argument should appeal to all political scientists: Policy preferences about racial inequality, like policy preferences about most other matters, are at their core political. Citizens choose among specific alternatives shaped by political elites; the process of determining alternatives and choosing among them is at base a moral concern and not merely a material one; people can be persuaded to choose what they and others think is right by the politics of framing morally desirable alternatives. Less abstractly, because enough Americans value fairness, equality of opportunity, and racial equity, they can be led to choose policies that will promote these values so long as the policy choices are not framed in terms of special benefits for blacks. Policies such as racially based affirmative action violate Americans' core universalistic principles, so people oppose them for reasons that have very little to do with racial prejudice.

Sniderman and Carmines complicate this basic argument in interesting ways by comparing liberals and conservatives, those who admit to racial prejudice and those who claim to "like blacks," and other basic groups. But in the end they come back to the claim that if elites frame choices in ways that reach beyond race, a majority of Americans will support policies that promote racial equality.

This is a surprisingly controversial argument for several reasons. Sniderman and Carmines do not help their case by characterizing people who hold one of the other three views described in the first paragraph as "both wrong and wrongheaded" (p. 115) or by emphasizing the overall results when it suits their argument (e.g., p. 30) but the differences between groups when that suits their argument (e.g., p. 40).

More serious is their, and other surveyors', insistence on analyzing views about affirmative action through the language of "preferences" and "quotas," on the one hand, and "pure merit," on the other. Quotas are almost always illegal, according to the Supreme Court, and are very rarely used to my knowledge, and I know of no university or employer who would operate on a principle of pure merit but for affirmative action. So these survey questions generate apparent attitudes that are distorted in at least two ways through no fault of the respondents.

Another reason for controversy is the authors' (or their editor's?) insistence on "dumbing down" the book to keep it short and snappy. That has the predictable effect of making scholars constantly irritated by the scanty reports on how regression analyses were conducted, or how questions were worded, or how seriously we should take the results of subgroup analyses (in one figure "the number of respondents ranges from 13 to 55" [p. 95]). It also keeps their definition of prejudice equivalent to whether whites "like" blacks, which is arguably irrelevant to the real issues of racial structuring in the United States. Finally, keeping the book short and snappy makes the last chapter of moral exhortation and policy recommendations too superficial. These are serious scholars who have thought for decades about the conundrums of race in America, and at least this reader remains frustrated that they kept their conclusions so simplistic.

But the main reason that the argument is controversial is the point with which I began: Sniderman and Carmines insist that racial conservatives deserve the same standing as racial liberals, that liberals are just as likely (or even more so) to be racially hypocritical as conservatives, and that ignoring race is the best way to reduce racial inequality. These are genuinely contentious claims, and the authors probably come closer to the median American view than do most scholars focused on pervasive racism. That fact does not make Sniderman and Carmines correct, but it does mean that we should pay close attention to the arguments in Reaching beyond Race.

Comparative Politics

Comparative Peace Processes in Latin America. Edited by Cynthia J. Arnson. Washington, DC: Woodrow Wilson Center Press and Stanford: Stanford University Press, 1999. 216p. \$60.00 cloth, \$24.00 paper.

Fen Osler Hampson, Carleton University

This important book examines how negotiation processes have contributed to efforts to terminate guerrilla insurgencies in six Latin American countries: Colombia, El Salvador, Guatemala, Mexico, Nicaragua, and Peru. Although these nations have widely disparate political, economic, and social histories, they share a number of characteristics. The guerrilla msurgencies in most cases continued past the end of the Cold War, all have democratically elected governments, and all sought at one point or another—with the notable exception of Peru—some sort of negotiation with the leaders of guerrilla movements.

The volume is divided into two parts. The first is comprised of essays that examine the conflict and negotiation history of each country in considerable detail. The second section contains comparative analyses and assessments of efforts to

consolidate the peace and political reform processes in different country settings. Justice and reconciliation issues are the subject of two particularly insightful chapters by José Zalaquett and Priscilla Hayner, respectively. In an equally valuable contribution, George Vickers examines the problems of reforming internal security institutions and the lessons of Central America, dramatically underscoring how high crime rates and a tenacious pattern of civil violence pose major and continuing threats to democratic consolidation in this region. Finally, postconflict political economy problems and challenges—an altogether understudied topic—are the focus of Rachel McCleary's short but good chapter.

Many edited volumes contain essays of uneven quality that wander across too wide a canvass. These chapters, all of high caliber, do not stray from the two central questions posed: (1) What conditions help sustain the transition to democracy in countries that have been wracked by recurring civil violence and social unrest? (2) What are the ingredients for a negotiation process that leads to a peace settlement and some form of political accommodation between governing elites and guerrillas?

In response to the first question, the case studies and the conclusion argue that in those countries that made the jump to democracy, guerrilla movements not only had to be convinced that they could achieve their political aims through the democratic process but also had to become active participants in the process. Other factors include a country's ability to tackle such problems as the demobilization and reintegration of former combatants, the needs of displaced peoples, poverty and underdevelopment, and electoral and judicial reform; the subordination of the security forces of the state to civilian control presents the biggest challenge.

In response to the second question, the volume argues that peace processes involve not only interests but also perceptions. Cynthia Arnson, in the concluding chapter, takes issue with rational choice theorists who typically argue that the cost-benefit calculus of key actors will only change in favor of a political settlement when the conflict reaches a plateau, or what is sometimes called a "hurting stalemate." Instead, she suggests, "the perception of interest of key actors as to the costs of continuing war and as to their future with or without a negotiated settlement" derives not just from their military strength/weakness or the real pain they are experiencing but from political will or a "voluntad de paz" (p. 451) as well. In advancing this argument, she argues that because perceptions are malleable and can be manipulated or influenced by external third parties, one does not have to wait for so-called ripe moments. One can create them by engaging the parties in a dialogue that explores a wide variety of political alternatives to continuing violence and conflict. Negotiated confidence-building measures and interim agreements can thus pave the way to a more robust set of political understandings and agreements that eventually terminate hostilities and leave the door open to democracy. Unfortunately, Arnson sidesteps the analytical problem of just how we should measure or assess the "psychological" as opposed to "objective" factors associated with "ripeness." She appears to argue that we should assess ripe moments by the parties' perceived willingness to accept confidence-building measures, in which case we are asked to judge actors' motives by their actions and fall into the same tautological trap that plagues the rational-choice definition of "ripeness." Even so, there is much to commend this book to both an academic and practitioner audience, particularly its insights and lessons about democratic transitions in war-torn societies and the sorts of measures and conditions that are required to sustain an often fragile peace process.

Why Governments Waste Natural Resources: Policy Failures in Developing Countries. By William Ascher. Baltimore, MD: Johns Hopkins University Press, 1999. 333p. \$65.00.

Gregory White, Smith College

William Ascher examines a fundamental puzzle in the politics of natural resource exploitation: Why do governments waste natural resources? For him, this question is most trouble-some for "developing countries" in Africa, Asia, and Latin America. Many countries in these regions depend on oil, forestry, mining, land, and water resources to stimulate economic growth, create employment, and generate revenue for the national budget. Blessed with abundant natural resources, however, far too many countries are cursed with the poor management of their resources. The result is not only failure in terms of economic goals but also environmental degradation and pollution.

To his credit, Ascher is critical of analyses that merely invoke greed, corruption, or incompetence by policymakers as a complete explanation. "The easiest way for a political scientist to seem penetrating and tough-minded is to 'model'

the behavior of political leaders as self-interested people out for power, personal financial gain, or both" (p. ix). In Ascher's view, such modeling is fundamentally cynical. More important, it leaves no room for potential institutional and policy reforms.

Instead, Ascher pursues a sophisticated, widely ranging comparison of sixteen cases of resource policy failure in, for example, Indonesia (oil), Malaysia (timber), Mexico (irrigation), Costa Rica (land and timber), India (copper), Nigeria (oil), and Cameroon (land, forests, and parks). He argues that officials in a variety of contexts resort to six strategies of natural resource exploitation in order to: (1) finance development programs; (2) provide economic gain for particular groups, regions, or individuals; (3) build the coffers of the central treasury; (4) generate rents to build political support for other endeavors; (5) capture the profits generated before other actors do so; and (6) avoid accountability. Natural resources are especially vulnerable to such efforts because there is little political cost; natural resource exploitation usually occurs in remote locations. If there are people on the land, they are frequently isolated and marginal. Moreover, natural resources are seen as abundant national endowments, a country's birthright to be "developed" rapidly.

Why Governments Waste Natural Resources details the range of policy failures that have occurred in the cases at hand, including poor pricing of commodities, failure to ensure competition through monopoly arrangements, imprecise property rights, inadequate information, overexploitation, wasteful spending, unwise investment decisions, and poor strategic planning. The enormous strength of Ascher's book is the manner in which it details and illuminates the wide array of policy failures. Moreover, the author adeptly demonstrates the enormous environmental damage. His examination of Cameroon's forest sector, for example, illustrates the cost in terms of deforestation, the loss of the bulk of rents to foreign logging interests, and the effect on local forest dwellers of logging in "conservation" areas.

In many important ways, Ascher's work points to the ongoing importance of vibrant area studies research. By skillfully plumbing a disparate set of countries and resource sectors—Ascher uses secondary materials when the case falls outside his own expertise in Latin America—the author is able to examine the validity and reliability of sophisticated theoretical concerns. His book has an admirable richness and complexity.

Despite its advantages, the volume suffers from two short-comings. First, Ascher only briefly treats the enormous and unpredictable external demand for natural resources in the international economy. It may be somewhat questionable to challenge mismanagement of a natural resource when the country is buffeted by fluctuating commodity prices in the international market or when foreign firms control the vast bulk of a given commodity's extraction and production. Ascher seems well aware of a given sector's connection to the external economy, yet he does not allow the possibility that the options open to policymakers may be exceptionally narrow.

On a related note, he may not give adequate attention to a country's colonial legacy or the manner in which its resource sector was incorporated into the international economy. Chapters 1 and 2, which lay out Ascher's theoretical concerns, seem to avoid a treatment of such matters. Yet, chapters 3-6, in which Ascher examines the cases in detail, do engage crucial external connections. For example, regarding Indonesia's oil company, Pertamina, Ascher notes its genesis in the 1950s under military control and its full

emergence in the 1960s after agreements with such international firms as Shell, Texaco, and Mobil.

Second, Ascher demonstrates a faith in market-based solutions that may not be sensible. He concludes that governments are ill-equipped to serve in the roles of resource developer and resource conserver. It is hard to quibble with this conclusion. Problems typically emerge when governments are expected to exploit a natural resource as well as regulate its exploitation. The author also makes a reasonable argument on behalf of restoring nongovernment control. Increased participation by private and communal entities would be consistent with trends toward privatization, community empowerment, and decentralization; such participation might enhance the regulatory capacity of government. Nonetheless, the implicit assumption in Ascher's discussion of the best practice and optimal policies—in order to distinguish from policy failures—makes a case for "dynamic efficiency" and the wisdom of market forces. Indeed, in Ascher's framework, government interference in market forces is what tends to prompt policy failures. One is not always convinced, however, that the market would treat natural resources better than meddling government officials or bad development

Despite these shortcomings, the book is an outstanding and provocative contribution to an important field of inquiry. Ascher makes a compelling case that governments should restructure their resource exploitation by, for example, simplifying the mandate of agencies, clarifying jurisdictions, and prioritizing through the central budget. The book also makes a worthy call for governments and citizens to pay greater attention to the effect of development strategies on the natural resource endowment. Again, nongovernmental actors figure into Ascher's framework in that they could play important roles by publicizing abuses, supporting opponents of policy, providing crucial epistemic support for proper policies, and challenging questionable governmental policy and claims.

Readers from the fields of environmental studies, comparative politics, and policy studies will be rewarded.

Community Conflicts and the State in India. Edited by Amrita Basu and Atul Kohli. Delhi: Oxford University Press, 1998. 363p. \$34.95.

Democracy, Development, and the Countryside: Urban-Rural Struggles in India. By Ashutosh Varshney. Cambridge: Cambridge University Press, 1995. 168p. \$39.95.

Ronald Herring, Cornell University

The common lesson of these seemingly disparate books is the difficulty of reading interests, identifications, and political dynamics from structure. It is handy to read interests from social structure, either via political economy or macrosociology; doing so not only enables parsimony and deductive power but also is easier than learning from individuals how they conceptualize the political world, and their interests and identities in it, which is tedious work typically left to anthropologists. Both books try to come to terms with the same question: Which of many possible political identities will become operative? Both are fine books, well worth the reading. Varshney has the harder job because he wants to resolve a specific puzzle. The authors and editors of the Basu and Kohli volume seek a framework within which divergent cases make sense.

Of the many ways to slice categories of political power, interests, and identifications, one is urban-rural. Varshney investigates the paradox of rural power. It is typically low at

early stages of industrialization, when peasants constitute a numerical majority, and very high proportional to population after industrialization, when fewer people are occupied in agriculture. The standard answer derives in part from the theory of collective action. Farmers in rich countries are able to mobilize easily—being fewer in number—and their demands are more affordable as agriculture proportionately declines in an expanding GDP. As Barrington Moore argues in his classic Social Origins of Dictatorship and Democracy (1966), peasants as a class are victims of modernization, but the few who survive—the farmers—are empowered by the economics of wealthy societies and the politics of Mancur Olson. Varshney argues that rural empowerment in India has operated both from above, in parliamentary politics and state institutions, and from below, in the form of mass mobilization.

Why should one select this particular political morphology, that is, see the world as urban and rural rather than as class divided, or sector specific, or inhabited by "communities," as in the Kohli and Basu volume? Varshney takes the urban-rural categorization to be unproblematic, but "rural" power is notoriously difficult to measure. Agriculturalists have increased their share in India's parliament over the years, replacing businessmen and lawyers, but parliamentarians do not always represent their origins very well, identifying instead with their destination. Moreover, more rural MPs do not necessarily translate into a prorural policy; the state has other compulsions. Does democracy make a difference to power and well-being of the countryside?

For Varshney, both identities and interests are constructed. Were there to be an imagined community of rural India, he believes that unity would prevail in democratic processes: Rural people are, after all, the majority. How much can the multiplicity of individual interests be obscured by a popular version of the ecological fallacy of social scientists—to think first of a "rural" interest? Varshney argues that rural power will be limited as long as ascriptive identities remain important. At the level of mobilization, then, the answer to the democratic paradox is that crosscutting cleavages of the sort investigated in the Basu and Kohli volume put limits on rural power. But is this the explanation of urban power? Urban interests are divided by similar alternative identities; after all, it is in caues that ethnic/religious carnage is more common. More important, I think, is that the power of capital is structural, not electoral. The state is looking over a political economy in which the interests of urban capital loom large: The "business climate," investment strikes, capital flight, and attracting foreign direct investment are all factors that confront and constrain any government seeking to retain power. Peasants will continue to produce or go hungry otherwise. Capital is mobile and hard to appease. That only large capital needs to be propitiated for its structural position is a logic that pervades the state as well as political rulers. Varshney himself acknowledges that the state is the critical actor blocking full success of agrarian power (and his disaggregation of the state is very

Dealing in sectors also leads to some awkward analytics. Varshney is certain that "rural India" has been empowered relative to rural sectors in other societies at similar stages of industrialization, but he acknowledges that between one-fourth and one-third of rural India—the landless laborers—have been left out of this empowerment and enrichment. But, he argues, a similar percentage of the urban sector has been left out, again the poor. If so, then why is the sectoral analysis important? Could one simply conclude that the poor have not been empowered, whether urban or rural? After demonstrat-

ing that rural interests are differentiated across crops and classes, Varshney concludes that in material terms farmers did not get the best-case scenario—increasing returns to agriculture—but also did not suffer the worst case—falling prices because of surpluses (awkward in a society with mass malnutrition). And subsidies rose, but netting out the effect of subsidies, low taxation, and terms of trade movements influenced by price setting and exchange rates is so tangled an enterprise that net effects are difficult to ascertain.

Nevertheless, new forms of mobilization did arise around what can be called scissors politics: Farmers caught between rising input costs and stagnant output prices press the state to fix one or the other. Contrary to the logic of Karl Marx's Eighteenth Brumaire argument about "potatoes in a sack" that peasants cannot form a class for themselves—Varshney devotes a fine chapter to the rise of agrarian power at the grassroots in the 1970s. At the level of cultural politics and movement rhetoric, rural India became an episodic political reality. The movements for higher prices were a new political form: nonparty, sectoral in self-identification, neither revolutionary nor trapped in ineffectual deployment of "weapons of the weak." The puzzle for collective action is that more people in rural India would be hurt by higher food prices than would benefit: Varshney admits that "price agitations...do not unambiguously serve the interests of the entire sector" (p. 138). Perhaps this observation is in itself sufficient to explain why there was only sporadic, regionally isolated, and unsustained collective action; the existence of alternative identities may not be necessary to understand the self-limiting nature of rural mobilization around prices.

The authors in the Basu and Kohli book take up just this problematic but find that, like rurality, identities organized around religion, caste, language, and region may not be stable. If identities are "politically constructed," and the raw materials vary enormously (not just caste, religion, language, and region but the specificity of each by place and time, further complicated by permutations of these variables), then which identity is emergent in particular configurations of political appeals and state action becomes mind-bogglingly complex. Moreover, state cues, state openings, state repression, and political competition among various groups frame the context of mobilization. The book is a refutation of primordialism in the form of "ancient hatreds," but, not surprisingly with so many variables at play, generalizations elude both authors and editors.

Kohli's model is basically competitive: With scarce resources, politicians deploy ethnic appeals, but if demands are met, the process is self-limiting. Competition for state resources has become increasingly democratic in a context in which hierarchical understandings of order have decayed. Competition, for example, leads politicians to endorse affirmative action, which in turn mobilizes backlash in previously privileged groups. It is inconcervable that all demands can be met. Both opportunists and hardliners exacerbate ethnic violence into self-reinforcing spirals. It is hard to know when concessions will defuse a conflict or when a show of force will escalate it, and therefore it is hard to know how the interests of state operatives lead to behavior.

It is likewise unclear ex ante what political strategies will work, but it is certainly true that the strategic cognitive maps of political actors matter fundamentally in mobilizing identities. In the piece by Mary Katzenstein, Uday Mehta, and Usha Thakkar, for example, the Shiv Sena shifts from ethnic ("sons of the soil") to religious (Hindu nationalism) appeals to reposition itself strategically to graduate from a regional party to a national presence (with some demonizing carryover of political tropes). Christophe Jaffrelot's chapter

illustrates that religious riots serve the interests of the Bharatiya Janata Party; by polarizing "communities," riots reinforce self-identification of Hindus, which allows the party to expand geographically. Amrita Basu notes that governments may be complicit with communal violence as a means to party ends. The methodological conclusion is that even more phenomenology of leaders would be valuable: What is inside the heads of those who pull the levers of state and formulate mobilization strategies? Again, reading interests and behavior off structural position confronts insuperable obstacles.

The results of these studies of identity politics are unclear. Varshney sees the mobilization of a specifically rural identity as furthering Indian democracy. Basu concludes that ethnic (often "caste") conflict may further the democratic process of reversing traditional patterns of oppression; but religious primordialism is more likely to be a threat to democracy. Arun Swamy's analysis of alternative modes of discourse of populism in Tamil Nadu illustrates the first point: groups with lower class/status mobilized against a system of ascriptive privilege and exclusion. Competition within the movement was between cultural nationalism and propoor populism. The results have been good for the poor and excluded, at least relative to plausible alternatives. One could draw a very similar set of conclusions from the mobilization of blacks in the American South, in terms of both forms and consequences of identity politics.

Some ethnic conflict deflects class issues, and some overlaps with class mobilization, particularly when ascriptive status coincides with class position, as it often does, in India or elsewhere. By coding such political forces only ascriptive, the real interests at stake (which are often, but only partly, material) are obscured. Jyotirendra Dasgupta faults the "standard narrative of violence" for failing to recognize "the long-term constructive implications of many anti-authority struggles" (p. 183). Lower-class movements in identity mode have, in Basu's words, "broadened the parameters of democracy by demanding greater rights and opportunities" (p. 246). In this sense, demands by social movements and political parties using the language of ethnicity have included devolution of power and resources in ways similar to those of social movements centered around the environment, civil liberties, and women's rights.

Both books are about appropriate units of political analysis; in neither is that unit the individual. There is a tendency in the Basu and Kohli volume to see a world composed of "communities." Varshney vacillates between a standard methodological individualist approach, which finds collectives problematic, and an assumption that there really is a rural community facing cross-cutting cleavages from other collective identifications of the sort analyzed in the Basu and Kohli book. What both works establish clearly is the multiple, unstable, and situation-contingent nature of political identities, interests derived therefrom, and subsequent political behavior. This is a useful corrective to both structural organicism, which takes social morphologies as given, and deductive methodological individualism, which reads interests of individuals off position. There is a largish gap between social structural position and perception of interest because positions are overlapping and because consequences of behavior are difficult to predict. How will higher farm prices affect employment prospects in the long run? How much economic loss will ensue from local riots? Will one's house be torched? Finally, identity interests are emergent and unstable, dependent on state cues, political opportunity, state openings and repressions, and complex imaginings at the individual level

that escape macro analysis altogether. One leaves these books wishing there were more about those individuals.

Environmental Politics in Japan: Networks of Power and Protest. By Jeffrey Broadbent. Cambridge: Cambridge University Press, 1998. 440p. \$64.95 cloth, \$22.95 paper.

Deborah J. Milly, Virginia Polytechnic Institute and State University

Japan experienced several decades of astounding postwar economic expansion, but the many Japanese who lived near sites of concentrated industrial production were well aware of its deleterious effects on their health and the environment. By the late 1970s, however, Japan's program of environmental recovery begun earlier in the decade was having a striking effect. From the vantage point of residents in rural Oita prefecture, in southern Japan, Jeffrey Broadbent untangles the contradictory politics that produced progrowth policies followed by environmental turnarounds. He explores protest over industrial development projects and their environmental effects as this activism was felt at multiple levels of government and society. An ethnographic narrative grounded in comparative and theoretical concerns, Environmental Politics in Japan is a study of the emergence, progression, and influence of protest that spans more than two decades.

The book situates Japan comparatively with other advanced, capitalist, industrialized democratic societies that face the dilemma of how best to weigh and balance conflicting goals of sustained economic growth and environmental protection. Japan stands out among this group, however, in the extremes it has evidenced in the form of "miracles" (in both its economic growth and subsequent environmental cleanup) and "debacles" (including extreme environmental pollution and inability to carry out plans to decentralize industrial production). The author attributes this pattern of extremes to the comparatively high "social intensity" of pollution in Japan and to societal factors. Social intensity, or the proportion of the population affected, accounts for the political readiness to take action after degradation occurs, but societal factors—particularly social and institutional networks-have intervened to facilitate or obstruct that readi-

This heavily documented account draws on more than 500 interviews and extensive archival research to provide a comprehensive treatment of the evolution of issues, protests, and interactions among individuals at different levels of government and society. Research was conducted in the late 1970s, when rapid economic growth had given way to new dilemmas of slow growth but when policy initiatives had begun to ameliorate the egregious aspects of environmental degradation. Fluent in Japanese and very familiar with Japanese society, the author lived for two and one-half years in Oita prefecture, where he observed the complexities of local politics surrounding a new industrial complex. Environmental Politics in Japan does much more, however, than depict a single moment in the life of local politics over the environment. It covers the period from the late 1950s through the early 1980s, and it recounts and reflects on politics surrounding five major policy shifts. These include cases of both development planning and environmental protection as well as instances of prefectural and national decision making.

The book is an engrossing study of collective action that begins at the local level but hardly ends there. Throughout the volume, the author compellingly weaves theoretical reflections on the dynamic relationship between structural features and individual action into the narrative accounts of specific interactions among protestors, their allies, and their opponents. Chapter 5 is particularly effective, for it systematically compares protest in several neighboring villages along an array of potential material, social, and cultural factors to ask why the responses to plans for Landfill No. 8 varied. In concluding that traditional social values and networks were important for supporting "breakaway bosses," Broadbent demonstrates concretely the types of conditions that produce a "plastic zone" in which change becomes possible (pp. 178–9). Discussions of the vertical interactions among local, prefectural, and national actors in other contexts are similarly thought-provoking.

When the author shifts from a discussion of microlevel interactions to the national political system, however, his conclusions have less power. It is one thing to produce thorough analyses of specific political dynamics involving individuals and their institutional and social contexts, as do the empirical chapters, but quite another to develop from these a generalization that will adequately account for Japan's comparative performance. Broadbent reviews several general models of power (pluralist, elitist, and class models, among others) for their applicability to the Japanese case and rejects them. Instead, he poses an alternative framework meant to incorporate the dynamism and contingency seen in the specific cases, but at this level of generality it is hardly distinguishable from the familiar models of Japanese politics. That said, the effort to develop an analytic paradigm that combines dynamism and contingency with general structural features is to be commended.

Comparativists attuned to middle-range issues will find that certain questions remain unasked. How does the pattern and pace of economic development affect the social intensity of environmental damage and its related political pressures? Do the recently democratized states in the region with similar patterns of economic development show any similarities regarding environmental effects, protest, and political response? What about those states known to have strongly clientelist politics? Although comparing Japan with its advanced industrialized peers makes sense in terms of its current global standing, given the period under discussion and the model of politics developed, at least a mention of alternative comparative lenses and cases would have been welcome.

Environmental Politics in Japan is a major accomplishment, rich in empirical research and theoretical reflection. Besides being a comprehensive ethnography, the book is complex in its use of multiple theories and analytic perspectives—it can be read and reread from a number of viewpoints. Those with an interest in social movements, protest, or environmental politics should be sure to add this to their reading list.

Women and the State in Post-Sandinista Nicaragua. By Cynthia Chavez Metoyer. Boulder, CO: Lynne Rienner, 2000. 149p. \$40.00.

Richard Stahler-Sholk, Eastern Michigan University

When the conservative Violeta Chamorro became Nicaragua's first woman president after defeating the Sandinista revolutionary government in 1990 elections, the implications for women seemed mixed. In one of the few extended studies analyzing Nicaragua's political economy through a gender lens, Chavez Metoyer contributes to the growing literature on women and the state in developing countries. She culls available sources for evidence of the effect of postrevolutionary policies on Nicaraguan women, assembling data that are enriched by interviews conducted between 1991

and 1996 period. Her interpretation of this transition draws on structural feminist and poststructuralist theories of the state as a network of power relations, with particular focus on gender.

Chavez Metoyer addresses three themes: (1) postrevolutionary gains and losses for women, (2) the social costs of structural adjustment programs, and (3) the changing role of the women's movement in Nicaragua. On the first point, she argues that although socioeconomic conditions worsened for women in the post-Sandinista era, they gained social and political space. On the second, the neoliberal adjustment policies of the Chamorro government are shown to have socially regressive effects, particularly for women, which is consistent with feminist critiques of structural adjustment. On the third point, she suggests the women's movement became more assertive and autonomous following the abrupt 1990 transition, as it confronted orthodox neoliberal policies.

Nicaragua specialists and students of revolution will benefit from this opportunity to contemplate the gender blindness that was a major flaw in the Sandinista project. Chavez Metoyer acknowledges Sandinista progress in opening social and political spaces for women, but she also notes that party control over the women's organization Luisa Amanda Espinoza Association of Nicaraguan Women curtailed its ability to press for the priority of women's issues in many areas of state policy. The study shows how insensitivity to the household-level effect of economic austerity and to the military draft widened the gender gap in the Sandinistas' 1990 electoral defeat. This gender perspective reinforces Margaret Randall's critique of the Nicaraguan and Cuban revolutions (Gathering Rage, 1992).

Chavez Metoyer's case study also provides important support for the argument that structural adjustment programs hide a gender bias, notably by promoting market-defined efficiency, which shifts costs from the paid to the unpaid (household) economy. The data are punctuated by poignant interview excerpts regarding household survival strategies. This case is also presented in the context of a brief overview of the regressive effect of neoliberal adjustment programs in Latin America, which makes it accessible to a more general readership.

Perhaps because of the focus on the state, the book is more thorough in its discussion of socioeconomic policies and electoral politics than of civil society organizing. A chapter on women's organizations since 1990 discusses the experience of three out of about 200 groups and does not fully convey the dramatic resurgence and diversification of the movement, beginning in the last years of the Sandinista government. A more radical wing of the movement took root in the mid-1980s within the women's section of the farmworkers association (downplayed on p. 29), and it flourished with the formation of the 52% Movement of independent feminists (not mentioned here). In the late 1980s and early 1990s there was a proliferation of women's centers in poor neighborhoods, women's health and popular education projects, and nongovernmental organizations that addressed aspects of the feminization of poverty. The latter included revolving loan funds, some based on the Grameen Bank model and targeting poor women, contrary to the assertion that nonconventional sources of credit remain out of reach for poor small producers, particularly women (p. 71). Also overlooked is lesbian and gay activism, which came out of the closet alongside the women's movement. The pot was beginning to boil over, even before the lid of Sandinista party discipline was lifted in 1990.

The author's assessment of the permanence of revolutionary gains for women focuses on contesting public policy and elected office. It is true that domestic relations are slow to change, but perhaps more attention to ideological and social transformation would help explain the postrevolutionary revitalization of the women's movement.

Nicaragua's political transition raises important issues regarding women's interests and the intersection of class and gender. Chavez Metoyer deftly notes the irony of Chamorro's campaign speeches celebrating the nuclear family—which does not correspond to Nicaraguan social structure, especially among the poor (p. 45)—and twice quotes her statement that she is not a feminist and does not wish to be one. "I am dedicated to my home, as Pedro [her martyred husband] taught me" (pp. 46, 98). Yet, voters, particularly women, found Chamorro's traditional mother/widow image more appealing than Daniel Ortega's macho campaign image of the spurred fighting cock. Chavez Metoyer consciously chooses to characterize Chamorro's presidency as nonfeminist rather than antifeminist (p. 52), and the agenda of the successor far-right Alemán administration as gender neutral (p. 13), despite the adverse effect on women of the shift in many aspects of state policy. Perhaps voters talked themselves into a comforting vision of escape from war and economic crisis, which were differently experienced according to gender. Or perhaps women in particular decided to use their organizing experience and consciousness gained through the revolutionary process, shed the Sandinista and feminist labels and baggage, and take their chances directly confronting the new state.

Nicaraguan women's seemingly paradoxical choice might be understood in terms of what Maxine Molyneux calls practical rather than strategic gender interests ("Mobilization without Emancipation? Womens Interests, State and Revolution," in Richard R. Fagen, Carmen Diana Deere, and José Luis Coraggio, eds., Transition and Development: Problems of Third World Socialism, 1986). Operating within the real-world constraints of existing gender constructs—and, for that matter, international political and economic power structures-Nicaraguan women increasingly sought to define autonomously their social movement strategies. The grassroots Nicaraguan and wider Central American women's organizations, galvanized but constrained by the revolutionary struggles for state power in the 1980s, began charting a distinctive course within the Latin American women's movement (see Nancy Saporta Sternbach et al., "Feminisms in Latin America: From Bogotá to San Bernardo," in Arturo Escobar and Sonia E. Alvarez, eds., The Making of Social Movements in Latin America, 1992).

An ambitious agenda is laid out for such a short book, so this work necessarily paints with a broad brush, occasionally using anecdotes to depict trends. Overall, it makes a useful contribution to an understanding of the gender effect of structural adjustment. It also suggests the continued relevance of the Nicaraguan case for understanding how women and other social sectors are affected by drastic transitions in the form and orientation of the state.

Democracy without Associations: Transformation of the Party System and Social Cleavages in India. By Pradeep K. Chhibber. Ann Arbor: University of Michigan Press, 1999. 287p. \$18.00 paper.

John Echeverri-Gent, University of Virginia'

Political scientists have generally focused on one of two variables to explain the nature of party systems. Following Duverger, many have analyzed electoral rules to account for the number of parties. Others have drawn from Lipset and Rokkan to argue that social cleavages determine the number. In *Democracy without Associations*, Pradeep Chhibber contends that when associational life is weak and the state plays an important role in economic and social life, parties can alter politically salient social cleavages and ultimately transform the party system.

This forcefully argued volume combines the study of Indian politics with subsidiary, theory-affirming case studies of Algeria and Spain in the penultimate chapter. Chhibber demonstrates an extensive knowledge of the literature on Indian politics, and he uses sophisticated techniques to test his arguments. By situating his study of Indian politics in a comparative context, Chhibber not only boldly takes on the conventional wisdom of Indian specialists but also makes a useful contribution to the theory of comparative party systems.

An important premise of the book is that India is characterized by weak associational life. This contradicts the widely accepted view among specialists that India is a highly politicized society. Chhibber's restriction of associational life to formal organizations dissolves this apparent contradiction even though it excludes informal organization, particularly India's extensive social networks, such as those that develop around the caste system. If Chhibber were to deny the existence of informal organizational forms, he would neglect the important role that they play in political mobilization. He makes this analytical distinction not to dispute the importance of informal organization but to highlight the principal and largely unmediated role played by political parties in linking these social networks to the Indian state.

Given the importance and originality of his argument concerning the weakness of India's associational life, it is unfortunate that Chhibber did not support it more carefully. Central to his contention are data from 3,000 respondents to a survey in six Indian states: Only 13% said that they belonged to an association, and 84% said that they did not belong or refused to respond to the question (p. 58). In a developing country, many people are reluctant to answer survey questions with political implications, so it is important to report the breakdown between the last two categories. Given the problems of comparative survey research, Chhibber could have built more confidence in his argument had he discussed the comparability of the Indian survey and the World Values Survey, which was the source of data about associational life in other countries.

Chhibber contends that the Congress Party can best be understood as "a collection of state parties, with the Congress Party in each state representing interests unique to its region and with a weak national organization" (p. 51). He argues that the party's state-level focus was the consequence of (1) the localized nature of social cleavages, particularly those of the caste system; (2) the single-member simple plurality electoral rule, which compels cross-caste coalitions; and (3) the federal division of power, which allots a vital role for state governments and renders local government powerless.

Chhibber's characterization of the Congress Party organization as weak and decentralized revises the conventional wisdom that stresses its resilience until the split in 1969 and then its centralization beginning under the leadership of Indira Gandhi. Chhibber's description is useful in giving patronage and localized patronage networks a prominent role in the Congress's success as a catchall party during the first two decades of the postcolonial era. His observations lead to the more novel argument that the decline of the party is due to the exit of its supporters rather than to the entry of

new voters into the electorate; after its electoral setback in 1967, intensified political competition provided defectors from the Congress with alternative avenues to political success. This helps explain why the national Congress leaders increasingly resorted to manipulating the allocation of central government resources to control state governments. Chhibber does not consider the possibility that the growing competitiveness at the state level incited the party leadership to centralize power even as local leaders defected. The cause of the party's decline may well lie in its leaders' centralization of control—through the patronage and substitution of loyal followers for more popular state leaders—at a time when the increasing competitiveness and diversity of state-level party systems undermined the prospects for electoral success of this form of party organization.

Chhibber's analysis of the transformation of the party system in the state of Uttar Pradesh (UP) and the rise of the Bharatiya Janata Party (BJP) convincingly documents the role played by political parties in converting India's catchall party system into a cleavage-based one. Chhibber persuasively depicts how the 1990 decision of the National Front government to implement affirmative action for India's "backward classes" and the subsequent BJP decision to intensify its campaign for Hindu nationalism placed the UP Congress in a position in which each caste group believed that the party favored another. The Congress's forward class supporters fled to the BJP, and its backward caste supporters left for the Socialist Party and others whose backing was more narrowly based. Chhibber attributes the ascendance of the BJP at the national level to its ability to forge a coalition among religious groups, the forward castes, and the middle

Chhibber persuasively supports his argument that partisan competition made political cleavages between caste and religious groups politically salient, but he understates the importance of other factors. Growing corruption within the Congress drove middle-class support from that party to the BJP. Furthermore, the BJP was quicker to accept the new era of coalitional politics and to develop an alliance strategy that exploited partisan competition at the state level. Finally, in various states, the BJP was able to incorporate the support of backward castes and others at the bottom of India's social hierarchy. After all, not only did the BJP make a backward caste politician the leader of the UP government, but also in the last three parliamentary elections it won an average of seven of the thirteen seats reserved for scheduled castes and tribes in UP and Bihar, states where caste-based cleavages are strongest.

The BJP's appeal to diverse social groups strengthens Chhibber's argument about the agency of parties. It suggests that in pluralist societies such as India, parties affect the political salience of social cleavages by exacerbating some while building coalitions that span others.

In sum, this important volume makes a useful contribution to the study of Indian politics by highlighting the centrality of political parties to the dynamics of the Indian polity. Its pointed argumentation is controversial but nonetheless useful in the issues that it raises. More broadly, Chhibber's arguments contribute to the study of comparative party systems by suggesting that the level of associational life is an important variable in the evolution of party systems and by demonstrating that in the context of weak associational life and strong state activism, partisan competition can transform the nature of a party system.

Leadership Selection in Six Western Democracles. By James W. Davis. Westport, CT: Greenwood, 1998. 232p. \$65.00.

Robert Elgie, University of Nottingham

The aim of this book is to fill an information gap concerning leadership selection in the United States, Canada, Britain, Germany, France, and Australia. In this respect, the author is no doubt successful. After all, comparative studies of this sort are rare, although the appearance of a special edition of the European Journal of Political Research (vol. 24, no. 3, 1993) dedicated to this theme suggests that academics are at last beginning to pay it some much needed attention.

The main argument is that across all six countries leadership selection is characterized by a number of common elements. The evidence suggests that those who come to office are experienced political figures. There is still little room for young turks, political outsiders, or first-timers. Similarly, there has been a general move toward increasing the level of popular participation in the nominating process. Even the venerable British Conservative Party has taken steps to democratize selection procedures. Equally, more attention is now being paid to opinion polling in the choice of political leaders, and everywhere television has come to play a major part in leadership campaigns and nominating conventions. In Canada at the 1993 Progressive Conservative Party convention there were 2,150 officially accredited media representatives for 3,469 party delegates. Finally, parties have shown themselves to be willing to change the rules of the game so as prevent potentially divisive contests from happening too frequently. In particular, leadership selection conventions have been separated from policyrelated conventions, so as to focus attention on the successful candidate rather than party differences over substantive issues.

In sum, the evidence indicates that it is still possible to oust incumbents or for them not to be renominated, but electoral defeat is the main reason leaders lose power. Successful candidates are invariably ones who show persistence, who benefit from good satisfaction ratings, and who have already had the experience of high political office. In addition, at least in the United States, Canada, and France, money is a key factor. Moreover, the ability to raise substantial funds is not just an essential element of an election campaign proper. It is also a key component of a successful preelection campaign because it is the first demonstration that a candidate can appeal to important electoral constituencies. By focusing attention on issues such as these, there is no doubt that this book sheds some light on how leaders come to power from a cross-national perspective.

Whatever its merits, the book has a number of problems, including factual errors. I have expertise in French politics, and in that chapter alone it was easy to spot a number of rather startling mistakes. Chirac did not step down from the prime ministership before the 1988 presidential election (p. 147). The correct spelling is Brice Lalonde, not LeLonde (p. 149). Dominique Voynet is a woman, not a man (p. 149). President Mitterrand's biographer is Wayne Northcott, not Southcott (p. 197, n. 4). Similar errors were not immediately obvious in other chapters, but these raise doubt as to the factual accuracy of the text as a whole.

More important, the coverage of the chapters is not uniform. The chapter on the United States provides a good thematic overview of how presidential candidates come to be selected and how nomination procedures have changed over time. By contrast, the French case comprises little more than a potted history of recent presidential election campaigns. Even the chapters on Australia, Britain, and Germany tend

to tell the story of the rise and fall of individual parties and their leaders at the expense of systematically addressing a uniform set of themes. More important still, it is not always obvious that like is being compared with like. For the most part the book is concerned with the selection of party leaders, but in the United States the president does not formally hold this position. Moreover, there is little or no mention of U.S. institutions that might be considered more comparable to European or Westminster-style party institutions, such as the chairs of the Democratic and the Republican National Committee, or indeed the Speaker of the House or the Senate majority leader. Even when party leaders are clearly being examined, it is not obvious in some cases why certain parties have been chosen for study. The main criterion seems to be parties that have produced presidents or prime ministers in the countries examined, but in Australia the National Party is discussed, although its leader has never been elected prime minister, and in Germany the Greens are mentioned, even though they have never produced a chancellor.

This is an overarching and, for the most part, wellresearched text, but there is a strong sense that much more can be learned about leadership selection from a comparative perspective. To this end, is it possible to establish a comprehensive list of selection processes? To be sure, the author identifies a variety of such procedures, including ones that are confined strictly to legislative representatives, those that make provision for a more or less inclusive comprehensive electoral college, and those that are much more open to popular participation altogether. The question still remains as to whether it is possible to construct a general typology of cross-national selection processes. In a similar way, do particular forms of selection procedures apply to only certain types of countries? Does the difficulty of introducing a system of presidential primaries in France indicate that this sort of procedure is applicable only to presidential systems, rather than to semipresidential countries such as France, never mind parliamentary countries such as Britain? All told, the failure even to address let alone answer these questions, and others like them, suggests that there is still ample room for a comprehensive book on leadership selection from a comparative perspective.

Reconstructing the State: Personal Networks and Elite Identity in Soviet Russia. By Gerald M. Easter. Cambridge: Cambridge University Press, 2000. 221p. \$54.95.

Judith Kullberg, University of Michigan

The collapse of Soviet communism intensified the long simmering debate over the nature of Soviet political reality and prompted a reexamination of the major models of the Soviet system. Although many scholars have contributed to this exchange, relatively few have devoted themselves to the next task: creating new, theoretically informed interpretations that exploit the wealth of information in previously inaccessible Soviet archives. Reconstructing the State is one of the few attempts to apply a fresh approach to new sources of information. In laying out a possible path of inquiry, the book takes up the serious work of theoretical reconceptualization of Soviet politics.

To explore anew the essential nature of the Soviet polity, Easter turns to the formative period from the mid-1920s through the late 1930s, the tumultuous era that encompassed Stalin's consolidation of power, the revolution from above, and the great purges. His central question is how the new, infrastructurally weak Soviet state rapidly expanded its reach

and radically transformed social and economic life in the period of the first five-year plan. He argues that previous answers to this question, which emphasized the organizational strength of the Communist Party, role of the secret police, or the mobilization and exploitation of social groups, are incomplete. In Easter's view, personal networks within the party leadership are the long overlooked piece of the puzzle that can account for the growth in state capacity and the success of economic transformation.

The empirical support for this argument is an examination of the role of the twenty individuals who held the position of first secretary in regional administrations during the Stalin era. According to Easter, these officials, whom he dubs the "Provincial Komitetchiki," or provincial committeemen (hereafter PK), constituted a distinct elite grouping. A number of factors linked the PK: humble social origins; similar or shared experiences as underground party workers before the revolution; strong personal bonds forged in the civil war; and a common heroic identity derived from Bolshevik victory in that conflict. Easter asserts that after the civil war the informal elite networks to which the PK and their wartime comrades belonged intersected with the formal organization of the Soviet state. The networks expanded outward from the local level, as network members were appointed first to positions within various regional administrations and later to high leadership positions in Moscow. Upon taking office, they in turn assigned fellow network members to positions within regional and local administration. Personal networks thus served as a sort of trellis upon which the state administration grew. Furthermore, by compensating for the lack of a communications infrastructure and weakness of local administration, networks enhanced the reach of the central state. The PK, for example, used their informal networks to transmit central directives to the local level, coordinate action, and rapidly allocate critically needed resources.

Although personal networks within the party elite thus facilitated the achievement of the regime's goals, Easter emphasizes that they also constrained the actions of central officials. He contends that in the early to mid-1930s the PK used the power resources of their informal networks and shared status as heroes of the civil war to impede temporarily Stalin's development of a despotic, command-administrative system. From this he concludes that the PK preferred a "protocorporatist" (p. 132) order that would accord them substantial autonomy in their domains and a right to participate in the formulation of national policy. Precisely because of this preference, however, the "central state" destroyed the PK along with virtually the entire old Bolshevik party in the purges of the late 1930s.

The chief value of Easter's study is that it illustrates the possibility of connecting the study of Soviet politics to the comparative mainstream. The elite network approach fits squarely within the theoretical tradition established by Mosca and Pareto, which has sought to demonstrate the profound effects of elite group characteristics on a nation's politics. The study also is part of a new genre of work on elites, exemplified in the work of Catherine Boone, Robert Vitalis, and Francis Hagopian, that attends to the ways in which intra- and interelite alliances and loyalties influence state formation and development. Because the book also contributes to the rich body of empirical research on elite structure and patronclient relations in communist nations, it lays the foundation for one of many possible bridges between comparative theory and communist and postcommunist studies.

Yet, however theoretically promising the elite network approach, the book falls short of persuading the reader that it offers a superior interpretation of Soviet politics or a more complete explanation for the success of Stalin's "great change" than those offered by such respected scholars as Stephen Cohen, Robert Conquest, Merle Fainsod, Sheila Fitzpatrick, or Moshe Lewin. The reason is that the author does not operationalize his key independent variable, the personal network. He neither precisely explains what constitutes a personal network nor describes how the presence of personal bonds between particular individuals can be ascertained. A table of the purported links between the PK and various individuals in the Politburo is presented (p. 81), but there is no discussion of the criteria and data used to identify the links. Moreover, Easter does not discuss how such networks are analytically separable from similar phenomena, such as the links between individuals that arise purely from location within the same or related organizations.

The lack of operationalization deprives the author of the analytical tools he needs to make a convincing case. The lines between formal organizations and informal networks in the accounts of events are blurred. Personal networks are everywhere, but institutions, other than those of the central state in Moscow, hardly seem to be present. Without a means of distinguishing between institutions and personal networks, Easter cannot demonstrate precisely how networks contributed to the strengthening of the state or constrained the actions of the central state leaders. He is also unable to assess the significance of elite networks relative to the particular institutions that played a major role in the revolution from above, namely, the party and the secret police.

A related problem is that the author repeatedly identifies personal networks as the primary or only cause of important historical events even when the facts suggest otherwise. A prime example is the interpretation given for the "Georgian affair," in which Stalin and Ordzhonikidze used strong-arm tactics to purge the Georgian Bolshevik party. Easter depicts the incident as a struggle for control between two rival Georgian Bolshevik networks, Ordzhonikidze's and another led by Mdivani and Makharadze. In contrast, most scholars have interpreted the purge as a move by Commissar of Nationalities Stalin (who is not even included in Easter's account as a major actor in the incident) to curb Georgian autonomy. This interpretation was first given by Stalin's contemporaries, including Lenin, who recommended in his deathbed "Testament" that Stalin be removed from the position of general secretary in large part because of his treatment of the Georgian Bolsheviks.

Although the empirical support for the claimed significance of personal networks is not compelling, this is not due to the absence of key evidence but to the lack of scientific rigor common in exploratory studies. Easter leaves little doubt that personal networks within the Soviet Communist Party existed and certainly puts forward enough evidence, much of it recently culled from party archives, to suggest that they played a key role in the formative period of state development. Because it offers a theoretically sophisticated approach that may yield important insights into the nature of Soviet political reality, the book deserves scholarly attention.

The Real Worlds of Welfare Capitalism. By Robert E. Goodin, Bruce Headey, Rund Muffels, and Henk-Jan Dirven. New York: Cambridge University Press, 1999. 358p. \$59.95 cloth, \$22.95 paper.

John D. Stephens, University of North Carolina, Chapel Hill

The first two sentences of the preface succinctly state both the breadth of analysis and the goals of this study. "This book represents an unusual collaboration between a philosopher, a political scientist, an economist, and a sociologist. The preoccupation we share is with the central question, 'What are the best institutional arrangements for promoting each of a variety of social, political, and moral values which the welfare state has historically been supposed to serve" (p. vii)? With Gøsta Esping-Andersen's Three Worlds of Welfare Capitalism (1990) as a point of departure, the authors attempt to investigate empirically which of the three welfare state types best meets its own self-proclaimed goals, as well as those of the other two types. They argue that it is not adequate to examine social rights of citizenship, that is, the formal entitlements of welfare states, as Esping-Andersen or Walter Korpi and Joakim Palme have done. Not only may these be misleading—because, for example, take up rates may be low—but also claims to superiority of liberal welfare states, for example, are based precisely on the contention that by minimizing government intervention with the market, economic growth and thus long-term material welfare are max-

The authors want to know how citizens really fare in these regimes over the long run. The long view is necessary not only to include effects of growth on material welfare but also because, as they rightly argue, for goals such as poverty reduction one should be primarily concerned not about whether a proportion of the population is poor in one year but about whether they remain so over an extended period. This concern with the long run leads the authors to choose panel data as the appropriate basis for their investigation. Adequate panel data over ten years are available for the United States and Germany, which are typical, even prototypical, of a liberal and corporatist state and a Christian democratic welfare state, respectively. Unfortunately, no such data exist for any of the Nordic countries, the obvious candidates for the social democratic type, so the authors are forced to select the Netherlands as their representative. The Dutch welfare state is the best candidate outside the Nordic countries, but it does deviate from the social democratic type in important ways (noted below), which could significantly affect some of the conclusions of the analysis.

In the initial section of the book, the authors outline the moral values and social and economic theories advanced by the proponents of the three types. For example, advocates of the liberal welfare state value economic efficiency and propose to maximize welfare by limiting government intervention. Their solution to poverty is to maximize growth, encourage private philanthropy, and limit government intervention to transfers tightly targeted at the truly needy in a fashion that will not reduce work incentives. The authors take the goals of each regime at face value: It is possible, they say, for each to maximize its own goals and not those of the others and thus to succeed on its own terms. This section identifies six goals that are valued differently by proponents of the three types: promote efficiency, reduce poverty, foster equality, enhance integration, promote stability, and encourage autonomy.

The middle section of the book is devoted to evaluating the success of the three countries in meeting the six goals. The authors devise multiple tests for judging success. In most cases, they compare market (pretax, pretransfer) outcomes to postintervention outcomes, as these differences figure importantly in the social and economic theories that underlie the three regimes. Since there are limitations on what can be gleaned from the panel data on income development, these tests vary in face validity. Few will dispute their results on poverty or inequality, but many might question whether the measures of autonomy or integration tap very accurately what social scientists, political philosophers, or politicians

mean by these terms. Nonetheless, I found the chapters on integration, stability, and autonomy elucidating, and the chapters on efficiency, poverty, and equality, which did not suffer from measurement problems, were quite convincing.

The authors then test whether the regimes met their goals, to the extent that they did, for the reasons posited in the underlying social and economic theories. I found this third section to be the most original and interesting part of the analysis. The basic finding is that any success of the liberal and corporatist regimes was not due to the reasons posited in the theories. In liberal theory, the market should have accomplished much more, and in corporatist theory, organizations in civil society much more, whereas in both cases, to the extent that goals other than economic growth were met, success was accomplished through government action. By contrast, in social democratic theory, government action is central, and the goals were achieved through the predicted mechanism. The authors' very provocative conclusion is that "the social democratic welfare regime is 'the best of all possible worlds' . . . no matter which of [the six] goals you set for your welfare regime, the social democratic model is at least as good as (and typically better than) any other for attaining it" (p. 260). This does not mean that every test favored the social democratic regime. For instance, the liberal regime did best in providing everyone with work, as labor force participation was highest there. Taken as whole, however, the data support the authors' conclusion.

It may be somewhat surprising that the liberal regime, represented by the United States, did not fare the best in increasing average material welfare. The period chosen, 1983-92 for the United States and 1985-94 for Germany and the Netherlands, certainly affects the results for growth in per-capita income, which was very similar for the three countries; in a more recent period, the Netherlands still maintains parity with the United States, with Germany lagging behind. Moreover, growth in per-capita income is not the authors' favored indicator of improvements in real standard of living. They argue, correctly in my view, that real equivalent (i.e., adjusted for household size) household income is a better measure, and on this measure, expressed as the change in the median or in proportion of households showing improvement, the Netherlands and Germany perform much better than the United States.

I see two major flaws in the analysis. The authors are aware that the choice of the Netherlands as exemplar of the social democratic regime is problematic. Since the panel data confirm in most cases a pattern found in annual surveys, I would have added one of the Nordic countries to the analysis as a better example, albeit one with deficient data. This would have led to different and more positive evaluations of social democratic regimes on at least three indicators: total labor force participation, pregovernment poverty, and welfare dependence. All these are related to a key difference between Nordic and Christian democratic welfare states, with the Netherlands being solidly Christian democratic in this case: The Nordic regimes are characterized by extremely high labor force participation among men and women, whereas Christian democratic welfare states have the lowest levels of the three regime types, due mainly to low labor force participation by women but also to such reduction strategies as early retirement or disability pensions for elderly workers (i.e., "welfare dependence" by the authors' measure).

The distinctiveness of the Nordic countries with regard to women in the labor force takes me to my second objection. The book overlooks more than a decade of work by feminist comparative welfare state scholars and presents an almost completely ungendered analysis. In the past three decades,

gender equality has become a central goal of the social democratic regime, and it should have been added as a seventh goal. The outcome would have been the same as for the other goals: We know from the work of Barbara Hobson, Diane Sainsbury, and others on Luxembourg Income Study (LIS) data that the social democratic welfare states would come out on top as the most gender egalitarian.

Despite its flaws, The Real Worlds of Welfare Capitalism is a major contribution to the comparative social policy literature. It compellingly joins the normative and empirical in an explicit fashion, and it throws down the gauntlet to the neoliberals. I sincerely hope that they will attempt to refute the authors' analysis empirically, but I fear that we will be treated to the same litany: The book's results on growth and efficiency cannot be right because they violate what we "know" about work and investment disincentives imposed by generous welfare states.

The Faces of Janus: Marxism and Fascism in the Twentieth Century. By A. James Gregor. New Haven, CT: Yale University Press, 2000. 256p. \$30.00.

Phoenix Fascism in Our Time. By A. James Gregor. New Brunswick: Transaction, 1999. 208p. \$32.95.

Franklin Hugh Adler, Macalester College

A. James Gregor occupies a singular place in the study of fascism because he has always gone against the tide of conventional wisdom in advancing two fundamental claims. First, Italian fascism possessed an ideological unity and political coherence unacknowledged in the largely misinformed professional literature. Second, Italian fascism represented a paradigmatic form of developmental dictatorship that would serve as a model for subsequent "progressive" movements and revolutions in the twentieth century. During the 1970s Gregor articulated these claims in a number of major monographs that tended to be poorly received or dismissed. With the unanticipated collapse of the Soviet Union in the wake of 1989 and the appearance of "fascist" tendencies where Marxism-Leninism had once reigned supreme, Gregor might very well have the last laugh, and he has begun to update his earlier work accordingly. The two books in question are part of this revision.

The Faces of Janus begins by frontally attacking the familiar Left-Right distinction (the Left is unambiguously progressive, and the Right is unambiguously reactionary). This distinction not only is historically suspect, according to Gregor, but also from the very outset was ideologically instrumentalized by partisan Marxist intellectuals and their "mesmerized" colleagues, intent on privileging purported movements of the Left and demonizing movements of the Right. Following the lead of Renzo De Felice, Italy's most distinguished historian of fascism, Gregor decouples Mussolmi's regime from that of Hitler, stressing not only its progressive, developmental tendencies but also its undeniable and distinctive origin as a heretical movement of the revolutionary Left. Much of the book is devoted to demonstrating that Marxist analyses of fascism, in different epochs and in different forms, were myopic, contradictory, and fundamentally erroneous.

The tone is often shrill, the style bombastic, the claims exaggerated; in short, vintage Gregor. There are curious absences: nothing whatsoever on the Frankfurt School or Antonio Gramsci. Least satisfactory is his treatment of critical, independent neo-Marxist and New Left scholarship of the late 1960s and 1970s, reduced by Gregor to Maoism, dependency theory, or the work of Nicos Poulantzas. Little

substantive account is given to contributions by the German and American New Left that had nothing to do with these positions, analyses articulated in such journals as Das Argument, New German Critique, and Telos (where Gregor obtained some of his most interesting material, such as Mihaly Vajda's 1971 and 1972 essays on the progressive nature of Italian fascism). Notwithstanding the polemical nature of Gregor's critique, however, his analysis is substantially correct, especially the untenability of traditional class analysis or later structuralist accounts inspired by Poulantzas and Louis Althuser.

In the most interesting part of the book, Gregor turns the tables on Marxism-Leninism and uses "paradigmatic fascism" as a model to explain the evolution of Russian politics, from the genesis of Stalinism through the post-1989 rise of what he calls "reactive, developmental nationalism" in Russia, especially the "proto-fascist" turn from orthodox communism toward what Marxists themselves used to call "national chauvinism," with its explicit rejection of internationalism and stridently emotional appeal to "nationalpatriotic forces." Gregor refers here to positions adapted by Gennadi Ziuganov, leader of the Communist Party of the Russian Federation, as well as Sergei Kurginian and Alexander Prokhanov in their publication, "Word to the People." An important source of this new nationalist program is the "ethnogenetic Eurasianism" of Lev Nikolaevich Gumilev, a form of ethnobiological "racism" that Gumilev claims is fully compatible with historical materialism. In fact, his major work, Ethnogenesis and the Biosphere, was issued by a state publishing house before the definitive collapse of the Soviet Union. Even if one is not totally convinced that the cunning of historical reason is fully on the side of Gregor, it is nevertheless the case that he offers us a powerful alternative explanation of the tortuous relationship between Marxism and fascism.

Phoenix: Fascism in Our Time is a theoretical reformulation of Gregor's earlier work on fascism as a developmental dictatorship, adding a new emphasis on "collective humiliation" as a psychological factor that both precipitates and pervades a reactive nationalist response. Gregor draws extensively on Italian intellectuals (Enrico Corradini, Alfredo Rocco, Roberto Michels, Sergio Panunzio, Giovanni Gentile, Giuseppe Bottai) who alchemized separate strands of nationalism, revolutionary syndicalism, idealism, and corporatism into a purportedly coherent, unitary developmentalist ideology that Gregor calls "paradigmatic fascism." As in The Faces of Janus, Gregor then applies a model of paradigmatic fascism to postsoviet Russia, where the emphasis on collective humiliation, resentment toward the West, and restoring the nation to the rank of a major power is especially striking.

Methodologically, Gregor commits the same error that haunted his earlier work, the tendency to conflate ideology with actual regimes and their political histories. At one level, the various aspects of fascist ideology can certainly be made whole, but an examination of the dynamics of the Italian fascist regime and its political trajectory yields a muddled conclusion at best regarding both the regime's unity and its commitment to developmentalism. More often than not, nationalists, revolutionary syndicalists, and technocratic corporatists were at one another's throats, moderated and restrained by Mussolini and his distinctive personal agenda. Alfredo Rocco, as Minister of Justice, was a confirmed statist at odds both with Edmondo Rossoni, leader of the fascist labor syndicates, and Giuseppe Bottai, Undersecretary of Corporations. Rossoni, an unreconstructed revolutionary syndicalist, promoted an autonomous, anticapitalist syndical state (sindacalismo integrale). Bottai sought to replace the

existing state apparatus with a new, revolutionary corporatist order based on functional hierarchy and technical competence. He ridiculed the authenticity and the representative pretenses of the fascist labor syndicates, which could only function when nonfascist unions were made illegal, as well as the political ambitions of the plebeian, self-aggrandizing Rossoni, with whom he actually came to blows.

The technical aspirations of early fascism (e.g., technical councils), as Gregor underscores, were never minimally realized, much to the dismay of Bottai and Ugo Spirito, who both conceded that the new corporatist order was effectively stillborn. This, too, was the view of Mihail Manolesco (Le siècle du corporatisme, 1938), a leading authority on interwar European corporatism. As for development, the most impressive growth rates occurred during the early "liberal" phase of fascism (1922-28), before an integrally fascist state was institutionally articulated. Obviously, the effect of the Great Depression complicates any definitive judgment regarding the regime's economic performance during the 1930s, although the norms that guided state intervention became increasingly more bureaucratic, cumbersome, and sclerotic. In fact, Renzo De Felice, to whom Phoenix is dedicated, depicts the 1930s as a period when fascism (as a distinctive ideology and as a distinctive regime type) became progressively marginalized by ducismo and the creation of a personal dictatorship. Such a record offers little support to Gregor's claims regarding Italian fascism's unity and developmentalism. Alberto Aquarone, in measuring the regime's revolutionary claims against actual performance, commented that these were più fumo che arrosto (more aroma than beef).

Although not fully convincing, Gregor's alternative conceptualization of fascism certainly merits further theoretical refinement and empirical application. For this to happen, Gregor must better specify its comparative range and denote its limits. One sometimes has the impression from his work that all oppositional movements are fascist, or potentially so; that fascism necessarily accounts for or exhausts all revolutionary possibilities. This hyperextension of the concept, in fact, is the reverse side of the analytic problem with which Gregor began, confining the concept of fascism to manifestly reactionary movements and exaggerating the Left-Right dichotomy. With Gregor's overly expansive concept of fascism, we run the risk of purchasing generality at the expense both of comparative taxonomy and historical specificity. Gregor has yet to prove persuasively that the product is worth the price.

Political Corruption. Edited by Paul Heywood. London: Blackwell, 1997. 230p. \$75.00 cloth, \$35.00 paper.

Arnold J. Heidenheimer, Washington University in St. Louis

This collection of twelve articles is the product of a workshop held at the University of Nottingham to which British political scientists invited contributors from several other countries and disciplines. The focus is partly on recent national experiences with problems of corruption and partly on theoretical models that analyze its nature and effects. Economists provide more of the latter, and political scientists offer more of the former with regard to selected countries in Western and Eastern Europe and in Asia.

Dawn Oliver delimits the British experience in combating corruption to parliamentary self-regulation of standards of conduct. Examining the scandals that led to the formation of the Nolan Committee and how its recommendations were implemented, she concludes that the MP transgressions under scrutiny were "relatively minor in-

stances of struggles for resources in politics," and she tends to view them as instances of "slackness" rather than corruption (p. 131). But Oliver concedes that the 1997 election showed that public confidence "cannot be taken for granted" (p. 131).

Donatella Della Porta and Alberto Vannucci analyze the recent Italian corruption landscape via a broader focus on how clientistic practices erode institutional autonomy, holding that "clientelism and corruption converged to form a spiral, the diffusing of one aiding that of the other." (p. 118) The question of how much they are prerequisites or correlates is not systematically explored. It might be asked whether, if clientelistic or other exchange relations are an essential correlate, there can be such a type as "autogenic" corruption, which involves abuse of office by just one person.

Is it more worthwhile to focus on what Della Porta and Vannucci call the "vicious circles" of clientelism-corruption-clientelism or to develop the corruption cycles framework of Christina Bicchieri and John Duffy? The latter presuppose that "corrupt incumbent politicians will compensate contractors for being in a prisoner's dilemma until they run out of funds" (p. 78). Cyclical effects are alleged to flow from the proclivity of politicians to offer the contractors too much excess compensation.

The corruption and clientelism paradigms are related to the rent paradigm in a theoretical discussion of development problems in the Third World by Paul Hutchcraft. He traces the ideological affinities of corruption scholars from their early base in modernization theory and argues that it is wrong to regard corruption as merely a "primitive way of conceptualizing rent-seeking" (p. 226). He goes on to tackle such questions as whether a political system generates an internal sense of limits able to mitigate the extent of corruption.

Two other articles deal with corruption phenomena in postcommunist Russia (Federico Varese) and Ukraine and the Czech Republic. For the latter a team led by William L. Miller builds on focus group discussions in which participants were asked to rank bribery along with other means of persuasion in dealings with officials. They found that allegations about the need to use bribery were more than twice as frequent in reports based on personal experience.

The subsequent European Commission scandals are anticipated in an article by John Peterson, which found the EU relatively corruption free but dogged by extensive fraud and pathological noncompliance. Evidently, the working rule of putting the internal monitoring mechanisms in the hands of Scandinavians and redoubtable Dutchmen such as Florus Wijsenbeek did not work quite well enough, thus leading to the forced exit of many commissioners.

Unlike the legion of economists who have recently entered corruption research, and who avoid problems by simply ignoring questions of definition, Mark Philp takes these seriously. He doubts whether the conventional way of ascribing the work of many economists to "market-based" definitions is really well founded. He pleads for the elimination of this category, since "what defines an act as corrupt is not that it is income maximizing, but that it is income maximizing in a context where prior conceptions of public office and the principles for its conduct define it as such" (p. 28).

This collection enhances corruption research through its numerous examples of sophisticated analysis and model testing.

In the Name of Liberalism: Illiberal Social Policy in the United States and Britain. By Desmond King. Oxford: Oxford University Press, 1999. 340p. \$65.00 cloth, \$19.95 paper.

Lawrence M. Mead, New York University

Desmond King is a British policy historian who focuses on British and American work and welfare programs. In Actively Seeking Work? (1995), he argued that government agencies in both countries have focused too much on enforcing the requirement that benefit recipients look for work and not enough on enhancing claimants' skills and improving opportunities.

In the Name of Liberalism broadens that argument to suggest that liberal democracies have inherent tendencies to illiberalism. They are supposed to value freedom and treat individuals equally, but leaders also want people to possess the self-reliance needed to live independent lives. Therefore, policies sometimes try to exclude the incompetent from the full rights of citizenship or to inculcate correct attitudes in the less functional. Such policies are illiberal but claim to serve liberal ends. They are also promoted by experts who influence politicians with the authority of science.

King offers three instances. The first is the eugenics movement of the early twentieth century. In both Britain and the United States, scientists who thought dysfunctional traits were inherited urged governments to promote sterilization of the unfit, lest their progeny burden society and adulterate the race. The second instance is the work programs set up by both governments during the Depression to provide work for jobless youth and so maintain their morale (the American case is the Civilian Conservation Corps). The third example is the effort by both governments to require able-bodied adults on welfare to work in return for their support. "Workfare" goes back at least to the British New Poor Law of 1834. It took on new life in the 1980s and 1990s when, after several decades of laxity, both countries imposed stiffer requirements on means-tested and programs. In the United States, the movement was led by Republicans, who in 1996 passed the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA). In Britain, Conservatives began the reform, but the New Labor government has continued

The cases are grounded in solid documentary research. King is correct that eugenics and workfare, if not the Depression work programs, had the weight of expertise behind them. But his presentation of the three cases is often wordy and repetitive, and the idea that they manifest an illiberal tendency in democratic polities fails to persuade. The views of the eugenists, which King quotes at length, were certainly illiberal, but he cannot show that they had much actual influence on policy. Although most states in the United States permitted or even imposed sterilization on the mentally impaired for a time, the reason may have been the practical one that incompetent adults cannot take care of children, not that they were viewed as subhuman. In Britain, political opposition was strong, and the government refused to recommend even voluntary sterilization. King claims that the movement helped bring about the curbs Congress imposed on immigration to the United States during the 1920s, but he admits other causes, such as rivalries among existing ethnic groups. As for the work camps, to threaten liberal democracy they would have had to be permanent and compulsory as well as indoctrinate their inmates, as in Nazi Germany.

But they were temporary and voluntary and made little attempt to shape attitudes.

The workfare movement is more important, because it is longstanding and makes clear-cut demands on aid recipients. The revival of work tests is the leading recent change in social policy in both countries. It also is the case that animates King the most. But is workfare really illiberal? It may appear to be, but in the end it may serve liberal ends. Work requirements seem to coerce people, but even a polity dedicated to freedom must engage in some social control. It must enforce some set of minimal social competencies, above all working, just as it enforces the criminal law. Otherwise, the mutual trust essential to a free society would decay. King seems to regret this, but he does not contest it openly. He actually admits that workfare has "broadened" liberal democracy by bringing its obligatory aspects into view (p. 308).

Workfare also may seem illiberal because it is invidious. Government enforces work on benefit recipients but not on other people. As King says, work tests "create differential experiences of citizenship" and "foster distinctions" among citizens (p. 290). But government faces a dilemma. Prolonged, nonworking dependency among the able-bodied already creates differences between citizens. The dependent, if employable, are looked down upon precisely because they are nonworking. Workfare aims to minimize distinctions by balancing support with a work obligation within welfare, just as the nondependent must work to obtain income outside government. Enforcing work ultimately vindicates the liberal value of equal citizenship. Full disclosure: My arguments for this in Beyond Entulement (1986) and other books are the main butt of King's argument.

Perhaps the objection is not to the demands of workfare but its paternalism. Workfare tells some people to work, when self-interest should already lead them to do so. It thus demeans them. King is exercised that the eugenists reasoned in so superior a way about how to solve the social problems of the less fortunate. But the moral is only that a liberal society must undertake its social control with passion and authenticity, not antiseptic detachment. Elected politicians must finally be in charge, not experts, and they must not condescend. But that is exactly how work requirements arose in both countries: Reformers imposed them out of anger, less at the recipients than at a permissive regime that had failed to enforce the common obligations of citizenship.

A surprising fact stands behind this book, and King is candid about it. Government has embraced workfare, at least in these two countries. Its success to date is clear. Coupled with a good economy, the policy has driven down the welfare rolls in the United States by more than half with "no direct evidence of mass impoverishment" (p. 284), although evaluations are incomplete. Yet, almost all British academics who study social policy are opposed. They remain wedded to the view, championed by T. H. Marshall and Richard Titmuss. that social programs should extend only rights and benefits to claimants, without behavioral conditions (pp. 222-5, 246-7). King could have added: Almost all American academics think the same. The expert influence of which he speaks comes almost entirely from "mavericks in think tanks" and other advocates "at the margins of the welfare reform debate and marginalized in the social policy intellectual community" (pp. 224-5, 235). There would appear to be something wrong, not with liberal democracy, but with the academic establishment.

Crafting Coalitions for Reform: Business Preferences, Political Institutions, and Neoliberal Reform in Brazil. By Peter R. Kingstone. University Park: Pennsylvania State University Press, 1999. 284p. \$60.00 cloth, \$22.50 paper.

Jeffrey Cason, Middlebury College

An enduring puzzle for Latin Americanists is how freemarket, neoliberal economic reform was possible. To the extent that such reforms harm labor or the poor, there is no puzzle, since these groups have not wielded a great deal of political power in the region. But to the extent that such reforms harm business interests, the puzzle becomes interesting. Even though business in the region has not always presented a coherent or consistent political agenda, it does have substantial influence over politics in most countries. Therefore, business support for neoliberal reform, which undid decades of inward-oriented economic policies from which business benefited, is more difficult to explain. In this excellent new book, Peter Kingstone addresses the puzzle directly and effectively. He frames it as follows: "After fifty years of protection and nurturing by the state, observers of Brazilian political economy would have expected Brazilian industrialists to actively oppose the reform process" (p. 1). In the end, however, Kingstone documents that business was much more flexible when facing reform, and under certain circumstances it was quite willing to endorse and support economic reform.

"Under certain circumstances" is a key qualifier in Kingstone's analysis, particularly since the author explores a number of instances in which business mobilized politically against reform. When it supported reform, however, this occurred for clear reasons. Chief among them were (1) the untenable nature of the status quo, (2) the credible promise of long-term benefits for business in exchange for going along with reform, and (3) predictable and regular access to policymakers. If any of these conditions did not hold, then it was much more difficult, if not impossible, for Brazilian governments to get business support for a reform agenda.

Kingstone makes his case by telling two quite different stories. The first (and most interesting for the nonexpert in Brazil) is the story of economic reform in the 1990s. Kingstone has a good feel for and understanding of the political dynamics of Brazil in the previous decade, and he tells the tale of reform failures and successes quite well. Throughout, the focus is on the relationship between business and the state.

The second story revolves around the responses of three industrial sectors—auto parts, pulp and paper, and machine tools and equipment—to the changes imposed by neoliberal reform. The sectors had very different levels of competitiveness and thus responded quite differently. Pulp and paper was quite prepared for economic opening, but the other two sectors faced more serious problems. In the end they were forced to adjust rapidly, and Kingstone illustrates the variety of strategies available to firms, which included selling out to foreign capital or domestic competitors, joint ventures with foreign firms, or going bankrupt and exiting the sector. Kingstone makes an obvious but sometimes overlooked point in his sectoral analyses: We cannot talk about business generally if we want to understand business preferences; we have to talk about sectors. Even one of the more generalizable conclusions about neoliberal reform—that it has led to an increased importance of multinational capital-does not apply across the board, as Kingstone shows in the pulp and paper sector.

In both his macro and micro analyses, Kingstone uses literature from both economics and political science. In the

end, however, he relies on political explanations to explain support for and opposition to neoliberal reform in Brazil. This is a wise choice, since undertaking such reform is an inherently political process, as many have noted. In Brazil, as Kingstone points out, the political problems associated with imposing neoliberal reform are particularly daunting: a constitution that makes it difficult for the central government to control expenditures and gives states (in Brazil's federal system) a great deal of leeway in using federal resources; political parties that are hardly well disciplined; and a tradition of political patronage that sucks resources from the national treasury and demands a high financial price for political support. Nonetheless, in spite of these challenges, Brazil has been able to carry out reform, even if this has occurred in fits and starts. Kingstone does an outstanding job of showing how these fits and starts have been conditioned by leadership styles, international economic shocks, and business strategies.

One of the most important points Kingstone makes is that business is quite ambiguous in its general approach to economic reform. That is, it is quite "available" for political mobilization in favor or in opposition to neoliberal reform. At particular times it both supported and opposed Fernando Collor's economic reforms (chap. 5), and it has both supported and opposed current president Fernando Henrique Cardoso's reforms (chap. 6). In other words, business cannot be taken for granted, and skillful leaders will be able to pull business in particular directions. Kingstone (rightly) concludes that Cardoso is simply a better politician than Collor; he more effectively "crafted" the necessary coalition to see reform through.

Finally, Kingstone does not simply provide impressive empirical detail on the Brazilian economic reform process; he makes an important methodological contribution as well. He attempts to bridge the unfortunate divide between more deductive formal research strategies and more empirical and comparative-historical work. As Kingstone points out, deductive work can help clarify our analyses and expose our assumptions, and he uses this work precisely for this purpose. At the same time, Kingstone's empirical analysis of the behavior of Brazilian business elites demonstrates that business preferences for policy are quite malleable and subject to political manipulation. At any given point, most business actors have more than one business strategy available to them. Therefore, it is their interaction with the political world that determines which option they choose. Kingstone does an admirable job of making this point, and many others, in Crafting Coalitions for Reform.

Bicycle Citizens: The Political World of the Japanese Housewife. By Robin M. LeBlanc, with a Foreword by Saskia Sassen. Berkeley, Los Angeles, and London: University of California Press, 1999. 263p. \$40.00 cloth, \$24.95 paper.

J. A. A. Stockwin, Nissan Institute of Japanese Studies, University of Oxford

Few commentators on the politics of Japan are impressed by the intensity of engagement with politics of Japanese citizens. There has been a tendency in the past decade for voting turnout rates to decline and for ordinary people to dismiss the "antics of politicians" as largely irrelevant to their real concerns. According to Ronald J. Hrebenar (Japan's New Party System, 2000, p. 22), "in the Japanese system, an important characteristic is weak identification with the political parties in the system." In a recent Asahi poll, 40% of respondents declared no party preference. Japanese politics

has even been dubbed "spectator democracy" (Hrebenar, p. 28).

Robin LeBlanc argues that the avoidance of politics by sections of the citizenry is a protest against the often corrupt and hypocritical attitudes of politicians and a system that seems to corrupt even those who enter it with the best of intentions. She contrasts the deliberate avoidance of political involvement as a form of protest with the argument of de Tocqueville that grassroots participation in politics contributes to democracy in a society based essentially on market principles. The central metaphor of the book pits those who travel by bicycle against those who travel by taxi. The latter are politicians, whereas the former are shufu, a word usually translated as "housewife." The term, however, has rather complex historical connotations, and today it tends to connote shallowness and lack of ambition among women who are content to stay at home and engage in rather aimless pursuits.

LeBlanc examined groups of shufu in a crowded suburb of Tokyo, full of high-rise apartment blocks, where husbands commute on average an hour to their place of employment and typically return home late at night. She found that many of the women she studied were involved in volunteer activities, and much of the book focuses on an organization set up by local shufu, called Sagrosho (literally, "work place"), where goods are bought and sold for the benefit of handicapped people, who themselves participate. In the course of LeBlanc's fieldwork, Sagyosho developed from a small-scale and extremely informal operation to a more sophisticated center that benefited from local government subventions. For the shufu, this transformation was a source of tension. LeBlanc succinctly describes their dilemma: "In order to defeat politics, the Sagvasho volunteers made a pact with the enemy" (p. 91).

The author also discusses the now well-known Network Movement and Seikatsu (livelihood) Clubs, which sell organically grown produce to members and have elected candidates to some local assemblies, largely in cities. (See Lam Peng-Er, Green Politics in Japan, 1999, an excellent book not cited by LeBlanc.) The final chapter examines in fascinating detail the successful campaign of a woman candidate affiliated with the ruling Liberal Democratic Party (LDP) in the 1992 House of Councillors elections. The author is at pains to show how, although the candidate ran on a platform of engagement with the interests of shufu, LeBlanc's own shufu respondents saw the woman largely as representative of the "elite politics" they rejected.

This book has excellent features but also some weaknesses. In many ways the most interesting parts are those rich in ethnographic detail. The world of volunteer groups and parent-teacher associations, run overwhelmingly by women in a society characterized by the "absent husband," is well described. To these women, national and even local politics are unimaginably alien, but the temptations to become embroiled in that world can be, for a few ambitious women, hard to resist. Yet, it is difficult for them to remain engaged with their core constituency, who, in LeBlanc's view, tend to reject them.

This is the first really serious account of the role of women in Japanese politics since Susan Pharr's Political Women in Japan (1981). Whereas Pharr was principally concerned with political activism, LeBlanc focuses on the rejection of politics. It is refreshing to read a book that challenges ingrained North American and European ideas about the desirability—and inevitability—of inducing marginalized groups to participate in mainstream politics. The notion that the game of politics as it is actually played is in itself alienating, and that a nonpolitical space (not alternative politics) needs to be

created, is intriguing. The enemy is not politicians, parties, or the political system but politics per se.

I have some doubts about the argument. The rejection of "elite politics" by many of the shufu interviewed by LeBlanc seems to have persuaded her that it was not necessary to give much more than a fragmentary account of what was occurring in Japanese politics at the time. Yet, her fieldwork in the early 1990s took place at a time of great political upheaval. The LDP lost its House of Councillors upper house majority in 1989 (and never regained it) and fell from power temporarily in 1993, and a series of coalition governments of varying composition have ensued up to the present. Parties have come and gone, and there is political confusion not unconnected with economic crisis. The LDP remains the central element in government, but the parameters of the system are bending alarmingly. The fact that LeBlanc treats this in a perfunctory manner suggests that she does not think it is terribly important. It is clear that many Japanese women (and men) are alienated by the way politics is conducted in their country, but what eventually emerges from the political turmoil of the past decade is assuredly important for their interests.

Although nonparticipation may be a political strategy of a kind, it is possible to find plenty of Japanese women with the determination to overcome cultural and institutional obstacles in order to help change the face of a political system desperately in need of reform. The dangers of being corrupted in the process are considerable, but for the future of all Japanese citizens, the dangers of a mass opting-out appear much greater. Tocqueville's insights may be relevant to the shufu of Japan after all.

Rethinking Party Systems in the Third Wave of Democratization: The Case of Brazil. By Scott P. Mainwaring. Stanford, CA: Stanford University Press, 1999. 390p. \$60.00 cloth, \$22.95 paper:

Barbara Geddes, University of California, Los Angeles

Scott Mainwaring combines a terrific description of the current Brazilian party system with an argument that classifying party systems in terms of their level of institutionalization deepens our understanding of democratic politics. An institutionalized party system, in Mainwaring's language, is one in which parties survive over a substantial period and remain committed to approximately the same ideological positions; voters have stable party loyalties; political leaders and voters see parties as central to the democratic process; and parties themselves are well organized, with substantial resources and routinized internal procedures not susceptible to manipulation by individual party leaders. Mainwaring argues that "weakly institutionalized party systems function differently [from] well-established systems, with significant implications for democracy" (p. 21). Much more of the book is taken up with showing, however, that party systems do actually differ with regard to levels of party longevity, voter loyalty, and party discipline than with showing the effects of these differences.

A description of the contemporary Brazilian party system and its effects on current politics and policy illustrates Mainwaring's argument and takes up much of the book. This description adds a great deal of useful and interesting concrete detail to the standard view of most Brazilian parties as fluid, personalistic, undisciplined, and decentralized. I found the discussion of candidate selection and the importance of patronage in the mobilization of support at party conventions especially thought provoking. The analysis of the

Brazilian party system displays Mainwaring's usual care, thoughtfulness, and insight. In addition, it contains memorable quotations and anecdotes about particularly egregious behavior by certain politicians, which make this section of the book lively reading. It could be assigned in either graduate or undergraduate classes.

Mainwaring's explanation for the lack of institutionalization, to use his term, in Brazil's party system is extremely eclectic, tactfully giving some credence to every argument on the subject ever proposed. To the older arguments about structural causes and the current institutionalist conventional wisdom, however, Mainwaring adds several ideas that I have not seen so well developed elsewhere. It is common to cite malapportionment as one of Brazil's problems, but Mainwaring shows in very convincing detail why and how it changes the party system. He also shows how the very decentralized candidate selection process undermines party discipline. And he notes the destabilizing effect on parties and party loyalty of manipulations of the laws governing the party system by the previous military government. These are all important contributions to our understanding of politics in Brazil.

The usefulness of lumping electoral volatility, party fluidity, and party discipline into a catch-all concept called institutionalization and used to classify whole party systems, however, remains to be established. Although the argument that disorganization, volatility, and unpredictability in the party system should have deleterious effects is inherently plausible, Mainwaring does not actually demonstrate their effects. In the one extended example of the effects of institutions on government performance, the struggle over stabilization and state reform in Brazil, the main characteristics of the political system to which Mainwaring attributes Brazilian difficulties in carrying out needed reforms are: party fragmentation, which tends to reduce support for the president in the legislature; ideological polarization, which can increase the ideological distance between the president and the median voter in the legislature; bicameralism, which increases the number of actors with potentially different preferences who have to agree to a reform; the need for supermajorities in order to revise the constitution before certain reforms can be passed; federalism, which makes it possible for governors to undermine reform implementation; and some presidents' lack of commitment to reforms. None of these characteristics are elements of the concept of institutionalization as defined by Mainwaring.

The concrete elements that contribute to party system institutionalization actually play an ambiguous role in explaining the tortuous path to reform in Brazil. Low party discipline can, as Mainwaring notes, in some circumstances make it easier for a president to put together a coalition supporting reform. Party fluidity is only important as one of several contributors to party fragmentation, which would tend to strand the president with little legislative support regardless of its causes. Electoral volatility is not even discussed in the chapter. Thus, the chapter on state reform and stabilization makes a strong and persuasive case that Brazilian political institutions have slowed the course of economic reform, but it does not show that weak institutionalization affected outcomes.

Despite these limitations, the book makes a major contribution to the understanding of Brazilian politics and to the comparative study of party systems. The field has been dominated for decades by research on a rather small number of West European countries and hence on the issues of greatest salience in well-established parliamentary systems. Mainwaring's book, in contrast, focuses on issues such as party discipline and party loyalty, which have clear impor-

tance in the currently consolidating posttransition party systems but have received relatively little attention in the Europeanist literature. The book takes a large step in the direction of building a truly comparative body of knowledge about party systems. I am sure the insights and ideas in this book will inform the work of everyone who subsequently studies party systems in new democracies.

Presidentialism and Democracy in Latin America. Edited by Scott Mainwaring and Matthew Soberg Shugart. Cambridge: Cambridge University Press, 1997. 493p. \$74.95, cloth, \$29.95 paper.

Presidential Institutions and Democratic Politics: Comparing Regional and National Contexts. Edited by Kurt von Mettenheim. Baltimore: Johns Hopkins University Press, 1997. 303p. \$45.95 cloth, \$15.95 paper.

Fabrice Edouard Lehoucq, Wesleyan University

Whereas Juan Linz ("The Perils of Presidentialism," Journal of Democracy 1 [Winter 1990]: 51-69) argues that presidential systems undermine democratic stability, Scott Mainwaring and Matthew Shugart's collection suggests "it depends." That is, whether presidents actually confront legislatures dominated by their opponents hinges upon particular ways of structuring public authority in presidential systems and the broader socioeconomic environment. More critically, the contributors to Kurt von Mettenheim's book believe that the debate setting presidentialism against parliamentarism is fundamentally miscast. In both volumes, the chapters shed light on whether electoral laws, party systems, and the internal organization of legislatures facilitate or hinder the ability of presidents to obtain legislative approval of their bills.

One set of essays deals with constitutional systems that furnish presidents with extensive powers but have electoral laws and congressional structures that promote undisciplined, multiparty systems. In a Presidentialism chapter a bit overloaded with constitutional details, Ronald Archer and Shugart contend that Colombian presidents do not get very much done, despite the fact that the constitution endows them with a vast set of powers. Because electoral laws encourage the proliferation of party factions, presidents are typically stymied by locally oriented legislators when proposing far-reaching reforms. In his chapter on Brazil, Mainwaring also argues that electoral laws and the internal organization of Congress prevents executives from confronting the country's many social and economic problems. Von Mettenheim, in contrast, asserts in Presidential Institutions that the Brazilian presidency has been a force for change; his contentions are difficult to assess, however, because he does not address the arguments made by Mainwaring and other critics of Brazilian presidentialism.

A related group of chapters analyze systems with powerful executives whose election is decided by the legislature if no candidate obtains an absolute majority of the vote. Eduardo Gamarra's two insightful chapters (he has essays in each volume under review) on what he calls "hybrid presidentialism" in Bolivia, curiously enough, uphold Linz's contention, even though Gamarra opposes replacing this system with a parliamentary one. Yet, his analysis suggests that the congressional selection of presidents means that prospective executives face powerful incentives to negotiate with rather than confront Congress, at least at the beginning of their term. Perhaps establishing a full-blown parliamentary system would simply promote higher levels of executive-legislative cooperation.

In Presidentialism, Julio Faundez takes on proponents of parliamentary solutions to Chile's political problems. Indeed, he argues that Chilean democracy survived for so long (1932-73) precisely because the presidential system moderated the centrifugal tendencies of a fractious multiparty system. He dismisses Arturo Valenzuela's claim ("Party Politics and the Crisis of Presidentialism in Chile," in Juan Linz and Arturo Valenzuela, eds., The Failure of Presidential Democracy, 1994) that a parliamentary system would have weathered the storm provoked by the socialist Allende government without, however, outlining why his counterfactual proposition is more plausible than Valenzuela's. In his chapter, Peter Siavelis argues that the demands of placating a powerful military have moderated political tensions in Chile with the fall of Pinochet. But as the transition fades from memory, an even more powerful presidency will create problems because, Siavelis suggests, the party system is still fundamentally multiparty in

Another set of essays in Presidentialism and Democracy in Latin America discuss presidents whose formal powers are less extensive. In his insightful chapter on Costa Rica, John Carey shows how relatively weak presidents get a lot done because electoral laws and legislative structures conspire to generate sympathetic congressional majorities for their policies. Similarly, Brian Crisp argues that the influence possessed by Venezuelan presidents stems from their predominant position within one of two large parties; like their Costa Rican counterparts, Venezuelan presidents do not have broad constitutional powers. Jeffrey Weldon nicely reveals that Mexican presidents were powerful not because of broad, constitutional powers but because they were the unquestioned leaders of a party that held a monopoly of state power in Mexico for more than sixty years. In all three cases, citizen dissatisfaction with established parties reduced the president's share of legislative seats and thereby created divided governments and gridlock. At least in Venezuela, governmental paralysis contributed to the electorate's recent embrace of a Bonapartist solution to the country's severe institutional and economic problems.

Several of the strongest essays in Presidential Institutions and Democratic Politics—those by Charles O. Jones, B. Guy Peters, and Bert A. Rockman-focus solely on the United States, the most prominent case of presidents who possess both few formal and partisan powers. In contrast to other chapters, these tend to emphasize the importance of style and other informal ways in which U.S. presidents overcome the obstacles generated by the separation of powers and divided government. A theme running through these essays is that presidentialism does not appear to make the United States more ungovernable than parliamentary systems in other industrial societies. This is a provocative hypothesis, but I wonder whether a more useful research strategy would be to compare the United States with other presidential systems to understand how particular ways of structuring public authority make these systems more or less ungovernable. Perhaps we should test hypotheses about whether and how institutions help make, for example, the Costa Rican and U.S. presidential systems stable by collecting evidence from relevant systems, regardless of where they are located.

Another set of articles in *Presidential Institutions and Democratic Politics* deal with semipresidential systems: those that combine independently elected presidents with parliaments that invest the prime minister with substantial executive authority. John T.S. Keeler and Martin A. Schain remind

us that there are several such models in France. De Gaulle's near dictatorial use of presidential power contrasts with Mitterand's measured use of authority during cohabitation, when he governed with a conservative prime minister who possessed a parliamentary majority. In her essay on Eastern European systems, Valerie Bunce sees many advantages to adopting variants of the French system. In divided societies undergoing a transition from state socialism, Bunce believes that powerful executives may be the only ones capable of advancing necessary reforms. In their respective chapters, Michael Bernhard and Jonathan Harris discuss the evolution of semipresidential systems in Poland and Russia, respectively. Bernhard, in particular, does a nice job of explaining the political choices that rather quickly led to the construction of the system in Poland.

In conjunction, these essays suggest several important qualifications to Linz's hypothesis. First, while the longevity of democracy is greater in parliamentary than in presidential systems, Mainwaring and Shugart are right to caution that this may be a function of the fact that a disproportionate number of parliamentary systems are located in former British colonies. That most presidential systems exist in Latin America also should alert us to the fact that something else these places have in common (autonomous military establishments?) may be responsible for the instability that has afflicted many (but not all) Latin American countries.

Second, there may be ways to improve the performance of presidential systems short of far-reaching constitutional reforms. These essays suggest that attention should focus on redesigning electoral laws to reduce party fragmentation and legislative rules that discourage majority party legislators from opposing the president. For constitutional reformers, then, the message is that democratic stability is enhanced by keeping the legislative powers of presidents restricted, especially if their partisan powers are weak. An alternative is the Argentine example. As Mark P. Jones explains in Presidentialism, gridlock is not a problem in Argentina because electoral laws generate stable congressional majorities that allow chief executives to obtain quite a lot of what they want. Furthermore, executives can rely upon a vast set of powers, especially the infamous "decrees of urgent necessity," to circumvent legislative opposition.

Third, we need to consider values other than stability when assessing the merits of alternative ways of structuring public authority. What makes the essays by Jones, Peters, and Rockman distinctive is that they are not principally evaluating constitutional systems according to whether chief executives get what they want from legislatures. It also might be useful to begin assessing whether institutional arrangements promote accountability (and how they do so), accessibility, and the other criteria we use to judge whether a democracy has "good government."

Fourth, it may very well be the case that presidential systems have certain advantages. A theme that runs through the essays by Archer and Shugart, Bunce, Rockman, and von Mettenheim is that presidents may be in a better position than other elected officials to push reform. Chosen by a majority of the national electorate, they may be among the few officeholders who can rise above locally based legislative parties to pursue the common good. Whether presidents are any more likely to propose reform—and win legislative approval of such policies—than prime ministers is a question for future research.

On the Fringe: Gays and Lesbians in Politics. By David Morton Rayside. Ithaca, NY: Cornell University Press, 1998. 384p. \$49.95 cloth, \$19.95 paper.

Donald P. Haider-Markel, University of Kansas

David Rayside adds to a growing literature on lesbian and gay politics and policy. His comparative study of lesbian and gay politics in England, Canada, and the United States focuses on several highly salient legislative issues and provides profiles of elected gay officials in each country. The cases are often dramatic, even riveting. Rayside's thesis is both empirical and normative. He seeks to understand the importance of mainstream and radical political action in efforts to secure civil rights for lesbians and gays as well as how groups can use the political system to make the lives of all citizens better. Rayside conducted 350 interviews with activists, journalists, elected and nonelected officials, and legislative aides to provide the main data component of this original project.

The book is divided into three sections, one for each country, with details on legislative actions, institutional structure, party politics, political culture, public opinion, and openly gay politicians. For the case of England, Rayside explores the dynamics of passing the antigay Section 28, which prohibited local officials from "promoting" homosexuality, and the later efforts to lower the age of consent for gay sexual relations. The Canadian case covers the successful efforts to add sexual orientation to the Canadian Human Rights Act as well as to provincial human rights laws. Interestingly, Rayside argues that the decentralized Canadian system simultaneously helped and hurt the efforts of gay activists. It seems that Canada has been the most receptive to gay civil rights at the national level, due in large part to a tolerant public.

The final section tackles politics in the United States, with particular attention to the debate over gays in the military. Rayside makes it clear that American gays and lesbians have won significant victories at all levels of government, and they enjoy more financial resources and political access than their counterparts in England and Canada, but they also face a larger, more vocal, and better funded organized opposition. Rayside demonstrates that groups on both sides of this issue have benefited from the multiple access points in the American system.

The author details the trials and tribulations of three openly gay politicians: British MP Chris Smith, Canadian MP Sven Robinson, and U.S. Representative Barney Frank. Rayside examines how each official chose to "come out" and under what circumstances, with a particular focus on legislative debates of the time. He shows how each struggled with a gay identity in public life and dealt with the sometimes conflicting demands of social movement activists, political parties, and a largely heterosexual constituency. Although these detailed accounts are illuminating, Rayside could have devoted more attention to comparing the problems faced by gay officials to those faced by minorities and women, and he relies little on the literature in this area.

Perhaps the greatest contribution of the book is the detailed analysis of gay politics in Canada and England, both of which have received less scholarly attention than the United States. Although Barry Adam (*The Rise of a Gay and Lesbian Movement*, 1995) provided a good base for understanding gay politics in these countries, Rayside's work is truly comparative in that it provides a richer analysis of political systems and institutions as well as the dynamics of gay politics in each country, and it directly compares how conditions and institutions within each society shape politics generally and gay politics specifically.

The author's contention that gays and lesbians in England, Canada, and the United States have obtained a high level of access to the political system but little real influence is confirmed by a number of other authors (e.g., Adam, The Rise of a Gay and Lesbian Movement, 1995; Robert W. Bailey, Gay Politics, Urban Politics, 1999; James W. Button, Barbara A. Rienzo, and Kenneth D. Wald, Private Lives, Public Conflicts, 1997; Donald P. Haider-Markel, "Redistributing Values in Congress: Interest Group Influence under Sub-Optimal Conditions," Political Research Quarterly 52 [March 1999]: 113-44; Ellen D. B. Riggle and Barry Tadlock, eds., Gays and Lesbians in the Democratic Process, 1999; Urvashi Vaid, Virtual Equality, 1995; and Kenneth Wald, Craig Rimmerman, and Clyde Wilcox, eds., The Politics of Gay Rights, 2000). Indeed, at times Rayside's arguments closely track those made by Vaid, but Rayside rarely references the important points made by Vaid and largely ignores previous empirical research in this area (see Timothy E. Cook, "The Empirical Study of Lesbian, Gay and Bisexual Politics: Assessing the First Wave of Research," American Political Science Review 93 [September 1999]: 679-92).

Although Rayside states that he is not concerned about the generalizability of his findings (p. xv), one has to suspect that any comparative research of this scope hopes to have some meaning outside the specific cases under study. What I found most troubling in this regard was Rayside's failure to note that perhaps there is nothing special about gay politics. He devotes so much effort to suggesting the uniqueness of gay politics that he may understate one of his most important findings: Gay politics often resembles everyday politics that existing theories can effectively explain, even across countries, institutions, and issues. Indeed, his research confirms recent journal articles that suggest the patterns of gay politics often fit those of other, less controversial political issues. Also, the gay movement has undergone many of the same strains and pressures as other social movements as it has become more institutionalized, which suggests that many social movements may be subject to the same processes. Furthermore, the factors that determine legislative and policy outcomes in gay politics, such as partisan control, public opinion, media attention and tone of coverage, interest group lobbying and resources, and the extent of a mobilized opposition, do not appear to be any different for most other policy

Rayside could have said much more about politics generally and the policy process in each of these countries. My point is not that gay politics is unworthy of scholarly study. In fact, I contend the opposite: Gay politics should be studied as a means for understanding political systems and politics generally. Gay politics intersects broad questions, such as civil rights and liberties, institutional structures, and the role of parties and interest groups, issues with which all students of politics should be concerned. Rayside simply could have been more explicit in this regard and in the nature of his contribution.

A central focus of On the Fringe is the tension between grassroots activists and mainstream interest groups within the gay social movement, and it is here that a problem surfaces with regard to understanding social movements generally. Rayside consistently refers to "a gay movement" in each of the three countries, but he never fully explains what a social movement is or is not. Instead, he focuses on formal gay and lesbian interest groups, which could be more or less than a social movement. Even though the author consistently notes the increasing need for "inside" lobbyists to develop a grassroots network that can be mobilized for legislative campaigns, he downplays this as a fundamental component of

modern interest group politics generally (see Ken Kollman, Outside Lobbying, 1998). But Rayside does note that the problems of social movement institutionalization are apparent throughout each of the cases. Activists have gained a seat at the table, but without much influence, there is wide disagreement over tactics, and movement groups themselves often reflect gender and race disparities in the larger society. Each of these conditions has surfaced in many post–World War II movements, which suggests a common social movement phenomenon.

Even with its shortcomings, the book would make an excellent secondary text for undergraduate courses in gay politics, American politics or policy, and comparative politics or policy. It is unlikely that *On the Fringe* would fit well with most graduate-level courses in those areas. Rayside has laid the groundwork for comparative research in gay politics, as well as for richly described cases that provide needed background on lesbian and gay politics.

Comparative Democratization and Peaceful Change in Single-Party-Dominant Countries. Edited by Marco Rimanelli. New York: St. Martin's, 1999. 454p. \$49.50 cloth, \$18.50 paper.

T. J. Pempel, University of Washington

Democracies enjoyed banner years during the last decade of the twentieth century. Worldwide, both military and communist dictatorships were in retreat, while numerous countries on all continents gave enhanced preference to the ballot box as the basis for selecting their political rulers. Nearly 120 of the world's roughly 190 states can now plausibly clarm to be democracies, and for the first time in history the proportion of the world's population living in such countries exceeds 50%. Of course, many of these countries may revert to authoritarianism on short notice. Furthermore, many citizens in nominally democratic regimes still lack the full political, social, and economic freedoms taken for granted in the few highly industrialized countries with deeply institutionalized democratic principles. Nevertheless, despite the obvious limitations, democracy is on the rise.

The book under review makes a sweeping effort to capture a key slice of this democratization within three types of regimes. The first is formerly Marxian regimes, such as the Soviet Union, Poland, Hungary, Czechoslovakia, and Nicaragua, in which a single ruling party has been replaced by electoral pluralism. The second is so-called Third World countries, such as Mexico, Brazil, Argentina, India, Taiwan, and South Africa, where authoritarian regimes have lost power. The third is Western nations that have experienced enhanced electoral pluralism. Broadly summarized, the book contends that all three types are commonly characterized by previous rule under the disproportionate, if not total, sway of a single political party. In most cases, the party was the state. Such rule gave way to greater electoral competitiveness and often to coalition governments.

This focus on the creation and loss of single-party rule gives the book its measure of internal coherence. The individual chapters loosely pursue a common agenda, asking why a particular country came under its specific form of dominance, why that dominance gave way, and what happened subsequently. In the introduction, Rimanelli endeavors to synthesize both the commonalities and differences within the particular cases.

Collectively, the essays reach several broadly common conclusions. First, long-term rule by most single parties is itself the result of an effort to topple previous power holders

and to establish a new basis for political control. Whether in the case of communism replacing tsarism in Russia, black self-rule under the African National Congress replacing white control in South Africa, the Congress Party of India, Mapai in Israel, or the Institutional Revolutionary Party in Mexico ending colonialism and forging a "new nation," the general pattern was the same. A populous political power base sufficiently strong to oust a formidable power was mobilized. Then, once state control was in hand, electoral dominance strengthened the new regime. Continuity of control took priority over concerns about whether new or old opposition forces were frozen out. Also, in most one-party regimes there was a "positive cycle" of dominance: State power became a basis from which to generate additional power resources that reinforced the electoral appeal of the ruling party, which in turn reinforced the party's grip on state

Equally clear is the fact that long periods of rule without a viable alternative to the party in power usually contributes to high levels of corruption. This is as true in democratic Japan or Italy, with the long-term but highly corrupt rule by the Liberal Democratic Party and the Christian Democrats, as in semiauthoritarian Mexico, with the introduction of narcofunding to ensure the continued rule of the PRI. Such cycles can be, and have been, broken. In a few cases, such as the Christian Democrats in Italy or the Socialist Workers Party of Spain, collapse came rapidly as a result of internal causes. But as was clear in Nicaragua, single-party control collapsed only after outside intervention and massive injections of foreign capital. Moreover, as the replacement of white by black single-party rule in South Africa, the toppling of communism in Russia, or the end of the Congress Party's rule in India have all made clear, a new and broader political base by no means eliminates a country's underlying problems of race, ethnicity, language, or economic transformation. New rules may address a nation's problems from a new base of power, but the problems remain the same as those confronted by their predecessors.

Such commonalities aside, the diverse countries considered, combined with most authors' efforts to capture the most recent historical developments in the regimes they examine, virtually guarantees that country specificities will outweigh analytic commonalities. For the most part, the authors focus on political parties and single-party dominance. But several chapters, such as those on Russia, Taiwan, Portugal, Nigeria, Brazil, and Argentina, devote little attention to single-party rule; instead, the concern is with the broader transition to democracy. Several other chapters give political parties more attention, such as those on Greece, Spain, and Nicaragua, but it is hard to make a good case that any single party ever gained long-term dominance. In at least one case, Japan, dominance by a single party receives only modest attention within the broader effort to examine postdominance reform processes. The greatest appeal of the book will be to readers interested in the individual countries and the light each chapter sheds on the detailed and complex factors that have shaped each regime in its own specificity.

People's Power: Cuba's Experience with Representative Government. By Peter Roman. Boulder, CO: Westview, 1999. 284p. \$70.00.

Susan Eckstein, Boston University

Against all odds, Cuba escaped the domino collapse of Soviet bloc communism, despite its heavy dependence on the superpower for trade and aid. Although Peter Roman provides little information on the dramatic effects of the USSR's dissolution on all aspects of life in Cuba, he implicitly enhances our understanding of why Cubans did not follow suit and demand systemic change. He shows how the political system works fairly effectively at the local level.

Roman traces the roots of Cuban politics to the philosophies of Rousseau, Marx, and Lenin and to the historical experiences of the 1871 Paris Commune, the 1905 and 1917 soviets, and the Russian revolution and its aftermath. He describes ways that Cuba borrowed institutional practices from the Soviet Union, such as the so-called mandate system, bases for delegate recall, reliance on nonprofessional politicians for representatives, the structure of assemblies, and the leading role assigned to the Communist Party in policymaking. Yet, he also highlights how the Cubans were, from a Marxist vantage point, democratically innovative, such as the constitutional requirement for competitive municipal elections removed from Party control and residence by municipal delegates in the districts they represent.

Roman focuses on the formal structure and functions of the political system. He draws upon available survey data as well as his own interviews and participant observations. Few other studies give as broad an overview of the system of so-called popular power at the national, provincial, and local level.

Nevertheless, Roman leaves important aspects of the contemporary Cuban polity theoretically unexplained and empirically undocumented. First, although he analyzes Cuban politics primarily within a Marxist-Leninist conceptual framework, he paradoxically reveals how nonideological the system is, especially at the grassroots level, where governance is most representative and most accountable to the citizenry. There, governance centers on everyday bread-and-butter issues, such as electricity and housing, candidates for office compete on the basis of their biographical profiles, not ideas, visions, and policy platforms; and ordinary people understand the limits to the issues they can address through the political system.

Second, Roman underplays the growing importance of nationalism to regime legitimacy. He hints at this in noting that national elections in the 1990s were, for all intents and purposes, framed as plebiscites, a "yes" for Cuba, and that the role of the party declined somewhat. But a content analysis of *Granma*, the party newspaper, would reveal how the Cuban leadership has come to emphasize patriotic heroes and events over Marxist-Leninism. Roman's theoretical framework provides no means to capture the shift or to understand its significance.

Third, Roman overlooks important signs that the political system is ineffective in channeling societal discontent. He makes no mention of the first-ever mass protest in Havana in 1994, the subsequent exodus of more than 33,000 boat people (stemmed only by the signing of a new U.S.-Cuba immigration accord), or the legal emigration of about 100,000 islanders since 1994. In Albert Hirschman's terms, the government is more tolerant of "exit" than "voice."

Fourth, Roman neither describes nor explains why Cubans increasingly are turning from politics to religion. Castro himself seems less blinded and bound by Marxism than is Roman. Or perhaps Castro understands his Marxism better: Religion is an opiate that may not be so bad at a time of extreme moral, economic, and political decay. In analyzing the political system nearly sui generis, Roman offers a level of welcome political detail, but much of contemporary Cuba that is politically consequential and that transpires outside formal political channels is undocumented, unanalyzed, and unaccounted for in the book.

Participation and Democracy, East and West: Comparisons and Interpretations. Edited by Dietrich Rueschemeyer, Marilyn Rueschemeyer, and Björn Wittrock. Armonk, NY: M. E. Sharpe, 1998. 304p. \$73.00 cloth, \$32.95 paper.

Jack Bielasiak, Indiana University

The aim of this volume is to provide a "fresh" theoretical and empirical approach to the study of participation in democratic settings by concentrating simultaneously on countries with long experience of democracy and on states newly engaged in the process. The motivation for addressing the issue in this manner, however, is founded upon contrasting developments. In the former communist world of East Europe, the primary push is to enhance participatory norms and civic behavior in order to entrench the democratic system. This comes at a time when observers of established Western democracies point to an erosion of public commitment and value support for civic activity. The contributors hope to understand these participatory impulses by bringing to bear a common theoretical prism on the "old" habits of the West and the "new" practices of the East.

The book's focus is on the role of intermediary social and political organizations as the foundation of democracy. The theoretical framework looks primarily to the self-organization of the political space between the state and the individual and to the extent and density of associational life as the answer to the puzzle of building and sustaining democracy. Such a perspective allows for an empirical study of participatory patterns in both East and West. This comparative approach is a departure from the prevailing trend in recent studies. In the field of transitology, for example, the focus is on the experience of democratization in the global South and East, where the common thread is how to attain the democratic ideal, whether in southern Europe, Latin America, or East Europe. By refocusing attention on the West, Participation and Democracy provides a benchmark that uses the knowledge of enduring democracies as relevant to the nascent pathways of participation and social organization in societies entering a democratic era.

There are a number of advantages to the East-West comparison. First, it allows a shift from the uncertainty of what is likely to happen in emerging democracies to a narrative of how associational life has developed in the mature democracies. Second, the case studies of the West reveal that there is no single answer to the dilemma of civic participation. Indeed, the West European and U.S. experiences examined in chapters by Bo Rothstein, Per Selle, Bernhard Wessels, and Robert Putnam showcase the diverse ways to create and maintain popular participation in civic organizations. The clear message to the East is that no singular transitional path is bound to assure the growth of associational life needed for democracy. Third, recent trends in the Western democracies reveal that even the most entrenched habits of self-organization and participation are subject to erosion and may lead to crises in the practice of democracy.

Even though not altogether new, these are important insights, and they are placed in greater relief by the East-West comparative undertaking. At the same time, the case studies fall prey to difficulties because of the comparison between developed and transitional democracies and the use of the same analytical tools across the East-West divide. We cannot overlook the theoretical relevance of regime transformation as a critical variable in the participatory modes shaping democracy. The problem is most clearly reflected in the very concepts used by the authors.

Contributors from the East use the idea of "civil society" as

the organizing concept for their studies. That ideal was instrumental during the collapse of communism and the subsequent transition, a concept that transcended the world of Vaclav Havel or Adam Michnik to penetrate academic discussions about the demise of the communist way of life. Andrzej Rychard, Michal Illner, Ferenc Miszlivetz, and Jody Jensen retain civil society as the analytical prism for understanding democratization in East Europe. In general, they concentrate on the shift from the mobilized society of communism, which preempted social selforganization, to the overriding task of inducing new participatory norms and organizations in the architecture of democracy. Not surprisingly, the experience of Poland, Hungary, and the Czech Republic speaks to the prevailing need to create new collective identities and find the organizational resources necessary to remodel social and political life in a democratic vein. The primary task is to entrench civil society as an intermediary space between the individual and the state.

In contrast, contributors from the West hardly mention civil society. Rather, their theoretical construct is built around "social capital," a term popularized by Robert Putnam, who is one of the authors in this volume. It is a concept that also aims at understanding participatory and associational life under democratic regimes, but its theoretical assumptions and conceptual applications differ considerably from the idea of civil society. In many respects, the different terminology used in this volume echoes the distinct vocabulary current among different branches of the political science discipline.

Crvil society is primarily the province of political theorists and area comparativists, whose main concerns are normative commitments to democracy and the re-creation of a participatory community after years of authoritarian suppression. Social capital is more the language of rational choice, which is concerned foremost with coordination and cooperation issues as they enhance or detract from equilibrium solutions, in this case voluntary participation in civic organizations and democratic endeavors. Norms and trust are important considerations, but the social capital idea concentrates on personal benefits and strategic calculations.

Different analytical concepts and the distinction between building and sustaining democracy render difficult a systematic explanation for the role and import of associational life in democracy in the Western and postcommunist worlds. This is evident in the book from the small place given to true comparative analysis and findings in relation to the individual case studies. Attempts at comparison are found in Rueschemeyer's theoretical introduction and in the editors' summary conclusion. The first is a clear exposition of societal self-organization as the foundation of democratic politics, enumerated in seven basic propositions. The last chapter is too brief a summary of the main findings, reflecting the difficulty of situating a common theoretical and comparative perspective.

The editors are to be commended for an ambitious undertaking that seeks to reconcile approaches to emerging and developed democracies, to East and West, and, consciously or not, different disciplinary approaches. Certainly, the individual chapters are solid analytical contributions that enrich our understanding of the relationship between participation and democracy, and especially its dynamic, evolving character.

Ambiguity, Coping, and Governance: Israeli Experiences in Politics, Religion, and Policymaking. By Ira Sharkansky. Westport, CT: Praeger, 1999. 216p. \$59.95.

Eva Etzioni-Halevy, Bar-Ilan University

This is a book about ambiguity as a policy tool; its message is that ambiguity is pervasive and that it works. The author not only analyzes but also unambiguously advocates ambiguity. This mechanism is portrayed as a mode of coping with problems rather than solving them. Whenever issues are contentious and the demands of various parties are irreconcilable, the search for an overall solution is futile. By contrast, "the fog of ambiguity... facilitates agreement" (p. 11).

Sharkansky follows in the tradition of Charles Lindblom (e.g., The Policy Making Process, 1968) and others who prefer "muddling through" over more systematic policymaking. Yet, Sharkansky goes even farther. For him, ambiguity is not only pragmatic and frequently inevitable but also humane and valuable (p. 23). The author applies this argument to Israel, particularly to the Israeli-Palestinian peace process. Ambivalence permeates this process, where it also proves its utility. "According to a narrow view, leaders may be lying to their constituencies. . . . By a larger view, however, the fudging of the truth may allow ... negotiations to move forward, and agreements to be made" (p. 90). Moreover, in this case "a lack of clear resolution of major problems is better than concerted efforts at a just solution" (p. 171). Indeed, the author goes so far as to claim that Israel's survival in the face of various threats owes something to its leaders' tolerance of. and skill in, ambiguity (p. 30).

Because the exposition of this thesis is not sufficient to fill an entire book, Sharkansky fleshes it out with a description of the many areas of politics, governance, religion, and so on, in which ambiguity prevails. He reviews instances of fuzziness not only in Israel but also elsewhere (e.g., among the Mormons in Utah) and even in the social sciences—such as the Coleman Report (James Coleman et al., Equality of Educational Opportunities, 1966). These descriptions, although interesting in their own right, are excessively wideranging—if not rambling—and most of them are superfluous to the book's chief point. Moreover, their roving nature makes the argument less tightly knit than it might have been.

More important, however, is the validity of the thesis. There can be little doubt that ambiguity is a widely prevalent strategy. It may even be, as Sharkansky states (p. 19), the essence of politics. But does it inevitably have the beneficial effects he claims for it? Does it always promote accommodation, or can it occasionally have the opposite result? And does it indeed prove itself with respect to the peace process?

In support of his view, the author first takes up the issue of the negotiations over the intractable problem of Jerusalem. He identifies the multiple meanings of "Jerusalem," and he shows that the city's boundaries are unclear; these two ambiguities, Sharkansky convincingly argues, may further a settlement. Since most Jews object to the division of Jerusalem whereas the Palestinians demand that it become the capital of their state, the said ambiguities may constitute the only hope for a compromise. They may enable Israel to hand over to the Palestinians certain areas that are not clearly within the city, where a capital could be established; it could be called not Jerusalem but Al Quds (the Holy City), a vagueness that both sides may be able to accept.

But does obfuscation work with respect to the overall Israeli-Palestinian peace process? According to Sharkansky, this process survives—despite overall dissatisfaction—because of ambiguity (p. 130). Indeed, for a time, this has been

true: Both sides have been equivocal about their intentions as a way to keep things going. In the long run, however, this strategy may fail. The Palestinians demand that Israel withdraw from the territories occupied in the Six-Day War, a demand that most Israelis reject. Yet, unlike the borders of Jerusalem, the pre-1967 borders of Israel (the "Green Line") are only too clear.

If an accord is reached that includes redrawing Israel's boundaries and withdrawal into them, then the chickens may come home to roost: A state's borders cannot be nebulous, and a retreat into them cannot be hazy. Part of the present disagreement concerns Israeli settlements in the territories claimed by the Palestinians, and there can be no ambivalence with respect to those. They cannot simultaneously be dismantled and kept in existence. Sooner or later double-talk must give way to clarity, and problems that have been kept submerged must surface. To my mind, the book's major drawback is that it does not sufficiently clarify this point.

In general terms, Sharkansky admits that ambiguity has a dark side, yet he understates its implications: "The dark side is not so much its disadvantages as the realization that many... practitioners of the craft seem unwilling to recognize its advantages" (p. ix). But is that the whole story? The author should have stressed that in some cases ambiguity may turn from an advantage into a disadvantage. What may have favorable results in the early stages of negotiations, or even in the drafting of a preliminary set of intentions, may have the opposite effect when a final contract needs to be signed and implemented. In Sharkansky's view, part of the dark side of ambiguity is that policymakers who embrace it at an earlier stage often shy away from it later. Could it be that this is not by mere chance but because of the constraints of reality?

The shortcomings of ambiguity may not surface in every case, but they pose a sufficiently widespread problem to raise questions about the overall validity of Sharkansky's position. His argument is challenging and well worth presenting, and it certainly should be noted, but couching it in more modest and balanced terms would have made it more convincing.

Mass Politics and Culture in Democratizing Korea. By Doh C. Shin. Cambridge: Cambridge University Press, 1999. 335p. \$59.95 cloth, \$22.95 paper.

Michael A. Launius, Central Washington University

Doh C. Shin has made a most welcome and long overdue contribution to the literature on both contemporary Korean politics and comparative democratization by focusing on the recent experiences of the Republic of Korea (hereafter Korea) as it institutionalizes its democratic transformation. The author asserts that democratization progresses through phases, and from the late 1980s through the 1990s, Korea moved through two of these: the disintegration of bureaucratic-authoritarian rule and the emergence of a pluralist and democratic order. Specifically, Shin's study emphasizes that the ongoing democratic transformation of mass culture and politics is the defining characteristic of the third or consolidation phase of the process.

The major contribution of this book is to orient scholarly focus toward the increasing importance of public opinion in analyzing and evaluating political change in contemporary Korea. Because public opinion matters rather little in strong-state authoritarian regimes, until the recent demise of the authoritarian regime in Korea, it was of marginal interest or

import to students of Korean politics. In the past, scholarship focused on elite behavior, regime type, political economy dynamics, and linkages with the global system. Recent events, such as the unprecedented publication of a political black list by a broad range of Korean civic groups before the 2000 National Assembly elections, clearly validate Shin's viewpoint and demonstrate that changes in mass culture as evidenced by public opinion sampling warrant our increased attention. This work stands alone as a comprehensive resource on this emerging and vital area of Korean studies and comparative democratization.

In terms of approach, the author seeks to define and distinguish the Korean model of democratization in terms of what the people themselves experienced during the late 1980s and early 1990s. The approach is exceedingly ambitious-perhaps too much so-for the author attempts to integrate and balance such complex factors as societal culture, regime structure, institutional and procedural substance, and cross-cultural/cross-national experiences in constructing an explanatory model of democratic change that works at the individual, institutional, and systemic levels of analysis. In his own words, "all the significant changes taking place at the macro as well as micro levels are considered in this study to offer a comprehensive and balanced account of democratization" (p. xxv). By trying to integrate and explain all significant micro and macro level changes of an entire society, the author may be attempting to explain/infer too much from the data at hand. Nonetheless, Shin tackles the challenge admirably and makes a strong and compelling argument for his point of view.

The study is grounded in the conviction that the most effective way to assess the dynamics of democratic opinion and behavior is to use survey research instruments that directly ask people not only what they think but also how they choose to act in the political process. The empirical basis of the study consists of six parallel surveys of the Korean mass public conducted over nine years (1988, 1991, 1993, 1994, 1996, 1997) by the Institute of Social Sciences at Seoul National University and the Korea-Gallup organization. The specific questions are included in an appendix. By jointly analyzing the six surveys the author minimizes the limited value of any one-time snapshot of public opinion and traces the trajectories, direction, and magnitude of institutional and cultural democratization over time. In addition, Shin assembled comparable data on countries in Asia and Europe that are considered functionally equivalent with the Korean case for the purposes of cross-national and cross-cultural compar-

Mass Politics and Culture in Democratizing Korea consists of five parts and nine chapters, but readers would be well advised to devote close attention to the meaty and essential preface, wherein Shin outlines the broad scope and method of his project. Part 1 discusses the political system and charts popular opinion trajectories concerning the transformation from authoritarianism, vestiges of regionalism, the developing practice of democratic politics, and the empirical evaluation of how changes in the quality of everyday life affect democratic transformation.

Part 2 focuses on the attitudinal and behavioral changes of average citizens since the late 1980s and may be the most interesting and compelling section of the book. Shin analyzes the degree to which democratic ideas and behaviors have become rooted in the citizenry, which is the true measurement of consolidation. There is clear evidence of the development of a civic consciousness as well as strong commitment to the general idea of democracy, but there is considerable disagreement over what kind of democracy the country

should pursue. The author identifies as many as six politically distinct groups (from fully committed supporters to opponents of reform) of nearly equal strength who support divergent democratic agendas, none of which is numerically powerful enough to lead the rest (pp. 76–9). This is a disturbing portent of continuing factionalism and dissensus for the future.

Part 3 deals with representative institutions, such as the National Assembly and political parties. Shin's findings are rather modest and more or less confirm the conventional wisdom: Although popular opinion of legislative performance was "at best lukewarm," democratic commitment did precede and shape support for the legislature (p. 163). In the chapter on political parties, the author notes the failure of the system to generate truly democratic and representative party politics. Shin essentially sees this as a consequence of the moralist Confucian culture that saturates Korean society and emphasizes personal qualities of candidates over their organizational affiliation. Yet, this seems to neglect the consistent structural failure of highly personalist elitist parties to root themselves in constituencies. Low popular support may, indeed, be a rational citizen response to obviously dysfunctional and unaccountable electoral and party systems.

Part 4 deals with non-Western roads to democratization and develops the notion that a viable Korean democracy need not necessarily conform to Western ideals. This is a recurring and controversial proposition in the literature and will be viewed with skepticism by many readers. It is clearly an area that needs further investigation and theory development. Chapter 7 deals with democratic consolidation during the Kim Young Sam era (1992-97), and it is a tribute to the volatility of Korean politics that his regime already seems like ancient history. It is noted that Kim Young Sam was quite successful in dismantling the power base of authoritarian government and delegitimating authoritarian rule, but he was not effective in consolidating democratic institutions and legitimating democratic values. This infuriated those who favored authoritarian policies but at the same time disenchanted those who supported increased democratization. It is unfortunate that the survey data end with the Kim Young Sam administration, for public reactions to the twists and turns of the Kim Dae Jung government might provide further understanding of the posited consolidation phase of Korea's democratization.

In part 5 the problems and prospects for Korean democracy are discussed. According to the data, authoritarianism persists in the beliefs, values, and attitudes of voters and officials socialized by previous regimes. As a consequence, most Koreans are only diffusely attached to the ideals of democracy as the preferred political system and basis for civic community. The author draws the very sobering conclusion that it may take several generations to remold authoritarian cultural codes, foster democratic behaviors, and liberalize Korea's Confucian values. According to Shin's findings, the path to a genuine democratic mass culture may be very long indeed.

This is an ambitious and provocative book that should be read by anyone with an interest in contemporary Korean politics and comparative democratization. Shin successfully demonstrates that rich material can be gleaned from public opinion surveys and that movement toward the consolidation of a democratic mass culture is well under way in contemporary Korea. That movement may be proceeding in fits and starts and may have systemic and cultural dimensions that are unique to the Korean context, but nevertheless it is steadily leading society away from its authoritarian past. This book

goes a long way toward clarifying and explaining the dynamics of that transformation.

The President and Congress in Postauthoritarian Chile: Institutional Constraints to Democratic Consolidation. By Peter M. Siavelis. University Park: Pennsylvania State University Press, 2000. 245p. \$55.00 cloth, \$18.95 paper.

Katherine Hite, Vassar College

A full decade has passed since Chilean dictator General Augusto Pinochet handed the presidential sash to a democratically elected civilian. The country has held two successive presidential elections, and despite both anticipated and unanticipated tensions in military-civilian relations, there is no mortal threat to the stability of democratic political institutions. In fact, the new millennium began with nothing less than a president from the Socialist Party, the very party the military ousted and brutalized little more than a quarter of a century ago. Chile has been held as a model country of transition from authoritarian rule, in which political leaders have fundamentally behaved consensually, the economy has essentially remained healthy, and civil society has been fairly quiet regarding divisive political and social issues.

Nevertheless, as Peter Siavelis persuasively argues in his study of executive-legislative institutional relations, such peace and stability are not rooted in the institutional framework designed by the military dictatorship and upheld in the redemocratized regime. Rather, the democratic process of lawmaking and limited reform during the 1990s was the product of an exceptional transition in which members of government and the opposition saw it in their interests to be exceedingly cooperative. In what Siavelis terms a system of "exaggerated presidentialism," the executive generally forwards proposals within the accepted boundaries of the congressional opposition's political, social, and institutional interests, and the congress willingly performs as a rubber stamp. The center-left governmental alliance has been cautious—overly cautious according to many—to assuage those who supported the authoritarian regime's neoliberal, antipolitics agenda. In addition, governance in the 1990s took place in the context of a society traumatized by the instability of the immediate preauthoritarian years and the repression of a seventeen-year dictatorship.

Siavelis examines a key question for Chileanist scholars: As democracia de acuerdos, or democracy by agreement among elites across the political spectrum, wears thin, will the governing institutions provide the appropriate framework for conflict resolution, thereby avoiding the stalemates and backlashes of the past? He suggests not. Moreover, he argues that without fundamental and quite viable reforms to strengthen the congress, the authoritarian framers' "protected democracy" design will certainly prove inadequate for further democratization because it stymies full political representation as well as the incentives to tackle collaboratively the continuing constraints to a more equitable and tolerant society.

In the tradition of Arturo Valenzuela, Siavelis offers a very readable account of the history of preauthoritarian Chilean congressional performance as an effective mediator of both national projects and parochial demands. He traces the unusual strength of the Chilean political system at that time, in which several parties achieve congressional representation and no one party could effectively govern alone. Accommodationist practices in the legislature, with no small dose of

clientelism or pork, contributed to the endurance of democratic rule in a region historically short on democracy. Presidentialist reforms in the late 1960s began to alter such practices, which Siavelis argues ultimately helped set the stage for the 1973 authoritarian response.

Once in command, the dictatorship sought to eliminate future politicians' "excesses." The 1980 constitution expressed true disdain for democratic political representation through its extreme presidentialist design; a bizarre, binomial majoritarian electoral system; and a set of powerful non-elected governing bodies. Although the democratic opposition negotiated and approved some reforms before assuming office in 1990, the core of the authoritarian design remained intact.

Siavelis details the workings of executive-legislature relations through the first transitional government of Christian Democratic leader Patricio Aylwin (1990–94). He gives Aylwin high marks for his leadership skills, a man who garnered support for his proposals through broad consultation and who explicitly recognized the legitimacy of the congress as representative. Nevertheless, Siavelis suggests that consultants outside congress, from select members of the nonelected party leadership to the major economic players, had a larger influence in lawmaking than the parliament itself, and under the Frei administration (1994–2000) the president made little attempt to disguise this fact.

A main concern for Siavelis is that the Chilean institutional balance of power severely undercuts a democratic opposition that may represent a significant percentage of society. There is little incentive for this opposition to cooperate or, for that matter, for the parties allied behind the president to remain so closely allied from their positions in congress. Siavelis demonstrates that, contrary to their expectations, the military constitutional framers did not design a system that decreased the number of competing parties. In addition, the power balance does little institutionally to encourage the executive to work closely with the congress, much less grant room for legislative initiative.

The question Siavelis inherently raises in the immediate term is a counterfactual one: What if, in the most recent presidential election, right-wing candidate Joaquín Lavín had won? Although the center-left alliance, led by Socialist candidate Ricardo Lagos, won its third presidential election last year, the race required a run-off, and Lavín garnered 48.7% of the vote. Moreover, Lavín has a powerful political operation, but his image is that of a one-man "doer," distanced from traditional political party machinations. The center-left's governing behavior over the past decade suggests that President Lagos will be quite cognizant of a significant opposition that must be respected. A Lavín victory may very well have affirmed the worst concerns Siavelis raises.

Siavelis could have provided more about contemporary internal party organization as well as the public's identification with and attitudes toward political parties. To support his concern about the legislature's weakness, Siavelis alludes to the general lack of interest and negativity Chileans express for congressional representatives. Yet, such negativity is not limited to the congress. According to national surveys, Chileans harbor even greater animosity for political parties in general, viewing them as self-interested employment agencies. Many perceive that the flip side of political elites' extremely consensual behavior over the last decade has been an insular, elitist politics, a lack of interest in civic engagement.

Moreover, congressional discourse and action in the 1990s was intensely conservative in the cultural sphere, particularly

regarding the family (there is no divorce law), gender (the term itself was officially banned from congress, a world first), sexuality, and reproductive rights. Together with such issues as considerable social inequality and the human rights atrocities of the past, Chilean politicians face a series of conflicts that are increasingly bound to test state-society relations. Siavelis underscores institutionalists' need to weave the dynamics of institutions and social and political context together, but in this he is less concrete.

This book is a very useful contribution both to understanding the political institutional dynamics of contemporary Chile and to relating such dynamics to the broader literature on democratic institutional design. Complementing quantitative data with a range of interviews with political elites, Siavelis provides a textured analysis that is often missing from institutionalist works. He extends institutionalist approaches beyond the presidentialist-parliamentary system debates to examine what kind of presidentialism in relation to what kind of congress would make for a more representative democratic politics.

Chinese Urban Life under Reform: The Changing Social Contract. By Wenfang Tang and William Parish. Cambridge: Cambridge University Press, 2000. 388p. \$54.95 cloth, \$25.95 paper.

Marc Blecher, Oberlin College

Mobilizing survey data from the late 1980s and early 1990s, Wenfang Tang and William Parish have crafted a textured, subtle, careful, balanced, and comprehensive picture of urban Chinese political sociology. Their work is located squarely in several comparative contexts, ranging from advanced industrial societies, to other former state socialist systems, to East Asian newly industrialized countries (NICs) (focusing on Taiwan). They treat the systemic changes in China since 1949, and the comparison with Taiwan, as offering possibilities for a grand social scientific experimental study, in which culture and history can be held relatively constant so that the effects of fundamental structural shifts from preindustrial, precapitalist society to radical state socialism and then to a more market-based system can be scrutinized. The main analytical foci are two: "how different social contracts shape people's lives" and "the winners and losers" (p. 4). Substantively, they address the distribution of education, employment and income, popular opinion about reform, labor-management relations, bureaucracy, political participation, and, through the collaboration of Parish with Sarah Busse and James Farrer, respectively, gender in relation to work and family.

The book is an invaluable contribution of the greatest importance and interest to students not just of China but of broadly gauged social change everywhere. It will also go far in informing future scholarship, for there is much here to be tested in interviews and in studies focused on particular localities in China as well as work on other countries. Chinese Urban Life under Reform develops a number of important overarching arguments. Although industrialization-modernization theory has some purchase on explaining the outcomes and reactions to reform in China, overall the authors find, somewhat to their surprise, that structural theories emphasizing the fundamental differences between capitalism and state socialism are far more powerful in accounting for the differences between Maoist- and Dengist-era China as well as between the latter and other market-based and marketizing countries. They find that class matters deeply in accounting for the effects of reform and the ways people understand and react to those effects. The authors are impressed by how malleable society proved to be under both state socialism and market-based structural reform.

On this last point, the collapse of radical state socialism and the stunning rapidity and success with which China has embraced structural reform have, understandably, induced many analysts to develop a profound appreciation for the power of the market to reshape and reorganize social and economic (if, in China's case, not quite yet political) life. In some quarters, the Maoist period is now regarded as little more than a fascinating, wrenching interlude that may have accomplished a good deal of ground-clearing and took the first painful steps toward industrialization and national independence, but that left behind scant legacy of its radical vision. The Right may offer a triumphalist view of Maoism's putative inconsequentiality, and the Left may be moan the reversals of China's noble experiment, but many in both camps agree with the wag who wrote that "the Party is over."

Tang and Parish disagree. Decades into reform, they find, for example, that Chinese women are still far more equal with men in employment and the home than are women in any other country. Looking at the Dengist-period labor market, they argue that the underlying structural changes accomplished in the Maoist period—such as extraordinary gains in educational attainment, nearly universal employment outside the home, and the precipitous drop in fertility—continue to undercut the effects of patriarchal recidivism and the pronounced employment discrimination they document for the 1980s and 1990s. These changes even extend to the home, where men do a greater share of housework, and where women have more power in family economic decisions than in other societies.

Turning to more general distributive issues, Tang and Parish find that Dengist China still has a highly egalitarian distribution of income. Compared with their counterparts in Taiwan and the former state socialist countries, not to mention the advanced industrial nations, Chinese factory managers, technocrats, bureaucrats, and even many private entrepreneurs have an income and standard of living that is significantly closer to that of manual workers. Although income returns to education are rising, they continue to be offset by significant returns to seniority. At the same time, the highly egalitarian distribution of education and health care across classes and between town and countryside, which was a hallmark of the Maoist political economy, is being eroded. In particular, the working class is losing out both from the new market-based mechanisms as well as the increasingly meritocratic criteria for school and university admissions.

Tang and Parish argue that in the Maoist period workers appreciated the close interpersonal ties with other workers fostered by the way that work was organized on the factory floor and by the comprehensive community life provided by most industrial enterprises, including shared housing, health care, and, often, schools and dining and entertainment facilities. They also believe that, ironically, radical state socialism in China produced a double dystopia: the alienation from work that Marx attributed to capitalism combined with the personalized dependency on superiors characteristic of precapitalist social formations. On these points they rely not on new data—given the political constraints, Chinese surveys generally stay away from the Maoist period—so much as previous studies, which, as my own more recent interviews with older workers suggest, may overstate the gravity and particularity of these problems.

For the Dengist period, Tang and Parish do have important new findings. They show that workers are, portentously, China's most dissatisfied urban class. The foci of discontent are declining income, welfare, and political status (as state policies and ideological priorities shift against them, and as they lose representation in the workplace and the party) as well as increasingly draconian workplace discipline. Their data, the latest of which come from the early 1990s, are a bit too early to capture workers' profound concern about employment insecurity that would soon develop and is predominant today.

Workers are not at all passive in the face of all this, although their political participation, at least in the late 1980s and early 1990s, still took the form of individual, particularistic contacting of workplace officials far more than use of approved institutional channels or collective action, such as slowdowns, not to mention protests and strikes. Here, too, there have probably been marked changes since the early 1990s. The authors anticipate some, such as the increased use of arbitration committees, but give short shrift to others, such as the rapid rise of strikes and protests in recent years. Yet, in their very interesting finding that worker reactions to China's structural reforms are conditioned more by their views of the national situation as a whole than by individual situations, Tang and Parish may offer an intriguing clue to why working class anger and protest are not even greater and more threatening. When combined with their finding that workers are the most dissatisfied class in urban China, Tang and Parish offer a cautionary tale about the potential for a significant social movement that could, especially in the event of an economic crisis, pierce the fragile, tense calm that prevails as of this writing.

The overall picture that emerges from Chinese Urban Life under Reform is of change that has been as incremental and controlled as it has been profound. The authors remind us that in the West, hegemony based on personal dependency relations was eradicated only by protracted labor-based resistance. The Chinese state, they also point out, is trying, with no small degree of success thus far, to short-circuit such resistance through a variety of cooptive, corporatist, diversionary, and repressive measures. When all is said and done, they portray China as in the midst of a Polanyi-esque "great transformation" that evinces, in a phrase hallowed in both China's twentieth-century revolutionary and reformist movements, decidedly "Chinese characteristics."

Ambiguities of Domination: Politics, Rhetoric, and Symbols in Contemporary Syria. By Lisa Wedeen. Chicago: University of Chicago Press, 1999. 230p. \$48.00.

Fred H. Lawson, Mills College

First-time visitors to Damascus invariably notice two things: the groups of armed men clustered at key points throughout the city and the massive portraits of President Hafiz al-Asad that loom over them. Scholarship on the politics of contemporary Syria focuses almost exclusively on the former. Lisa Wedeen urges that greater attention be paid to the latter, not because clusters of armed men are politically inconsequential, but because explanations for Syrians' obedience to the present authorities that are couched in terms of outright coercion "remain incomplete. They fail to account for the ways in which language and symbols mediate, structure, define, and continually reassert political power and obedience" (p. 156).

Among the various symbols that have served to buttress the predominance of the military wing of the Ba'th Party over the last three decades, none has proven more potent and durable than the depiction of President al-Asad "as omnipresent and omniscient" (p. 1). This image stifles dissent in at

least two ways. By "cluttering public space," it makes it impossible for "alternative symbols, discussions, and language" to be articulated (pp. 33–49). By underscoring the president's presumptive role as head of Syria's "national family," it is a trope that promotes "understandings of obedience and community in terms of a chain of filial piety and paternal authority that culminates, and stops, in Asad" (pp. 49–65).

Nevertheless, and despite the government's best efforts to maintain the status quo, Syrian citizens have learned to undermine the legitimacy of Ba'thi rule by constructing novel reformulations of permissible slogans and imagery. One prominent artist who was commissioned to design a poster to commemorate the October 1973 war, for example, opted to superimpose the president's face over a scene from the twelfth-century Battle of Hittin, in which Salah al-Din drove the Crusaders out of Jerusalem; "the artist claims that his point, however, was to draw people's attention to the contrast between Salah al-Din's triumph and Asad's 'victory'" (p. 3).

Popular stage plays and television serials regularly lampoon the corruption that pervades state agencies, the leadership's evident failure to deliver on its grandiose promises, and even the instruments of physical torture that the security services routinely employ against suspected enemies of the regime (pp. 92–107, 112–20). Moreover, as in virtually all Arab countries, a wide assortment of jokes poke fun at almost every aspect of politics, including the president (pp. 120–9). Public compliance in Ba'thi Syria therefore turns out to be inherently "complicated" (p. 143). "On the one hand, the [regime's use of the al-Asad] cult is risky, as it invites the very subversion it seeks to manage. On the other hand, the methods of resistance open to most Syrians, although frequently courageous and ingenious, are by themselves incapable of significantly altering 'the order of things'" (p. 159).

Wedeen reaches these conclusions on the basis of what she calls "a 'political ethnography' of power in contemporary Syria. By insisting on the importance of ethnographic detail," she asserts, "I hope to explore the advantages, costs, and political significance of public rituals, while at the same time supplementing those concerns with a symbolic interpretation of the actual content of Asad's cult" (p. 25). But the book is a peculiar sort of ethnography indeed. It offers no systematic, detailed account of the daily lives of the population under observation. Instead, it presents a handful of anecdotes (pp. 65-6, 67, 161 n. 6), one of which is subjected to exhaustive commentary (chap. 3). It recognizes no distinctions between rich and poor, Muslims and Christians, 'Alawis and Kurds. Rather, it generalizes about Syrians as if they constituted a uniform mass: "Syrian families," for instance, "not unusually, tend to be hierarchically organized and stratified on the basis of sex and age: the young are subordinate to the old, women are subordinate to men" (p. 51). In fact, the study pays no attention at all to "people's experience of their political lives" (p. 160). On the contrary, it scrutinizes a selection of texts produced by the regime's supporters—including a newspaper editorial (pp. 42-4), a short story for children (p. 53), a panegyric to the president (pp. 54-5), and a poem honoring the memory of his mother (pp. 58-60) without analyzing the effect of such writings on different audiences inside the country.

Ambiguities of Domination illustrates both the attraction and pitfalls of the new cultural studies for political scientists. Investigating public spectacles, stage plays, cartoons, and jokes can undoubtedly tell us something useful about Syrian politics. But anecdotal, superficial "ethnographies" almost certainly distort more than they clarify. And it would make little sense to embark upon an inquiry into the rhetorical and

symbolic complications associated with compliance and transgression in Ba'thi Syria had an earlier generation of scholars not exposed the complex dynamics whereby powerful actors and institutions exercise physical coercion in the domestic arena.

The Political Economy of Dictatorship. By Ronald Wintrobe. Cambridge: Cambridge University Press, 1998. 390p. \$65.00 cloth, \$24.95 paper.

Susanne Lohmann, University of California, Los Angeles

Political science typically covers the modern state, which emerged around 1776, and mass democracy (regimes with mass suffrage), which emerged around 1870. Most states today are democracies of some form or another, and most were founded after World War II. Thus, much of what political scientists know and teach about government is based on our study of democracies and regimes that have been around for a comparatively short time. And, of course, much is based rather parochially on our study of post-World War II American institutions and American political behavior.

Recorded history covers 5,200 years (3200 BC to 2000 AD). Political science should be about all, or at least the most important, states and governments in history. It should cover various types of states and government, not just the modern state and mass democracy. It should draw on states and governments that have lasted centuries or even thousands of years, not just a few decades. There is such a thing as innovation in government, and political science should show how government has improved over several thousand years, but it also should deal with, and explain, discontinuities, large-scale breakdowns, and dark ages.

S. E. Finer's three-volume comparative History of Government from the Earliest Times (1997) does all this, and more, and does it brilliantly. Finer selects regimes according to the following criteria: "first, the historically great and mighty polities, next the archetypal polities, thirdly innovators great or small; and, finally, the vivid variant" (vol. I, p. 1). He analyzes these regimes according to a standard format and assesses their general character, strengths, and weaknesses using a standardized set of criteria. He develops a typology of regimes (territory: city-state, generic state, empire; decisionmaking personnel: élite, masses; and decision-implementing personnel: bureaucracy, armed forces). He identifies recurrent themes (e.g., religion, or more generally belief-systems, and the legitimation of power; constraints or limitations on government). He identifies elements in these various forms of government that can be described as "inventions" (e.g., simple and supermajority rule; representative assemblies). He deals with stable and unstable regimes, breakdowns, and

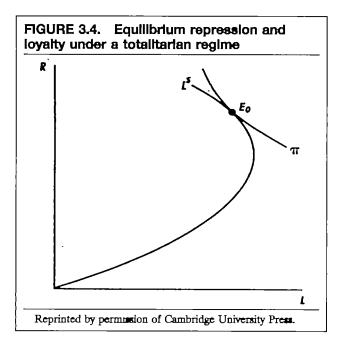

It is against this background that I read Ronald Wintrobe's Political Economy of Dictatorship and was disappointed. In all fairness to the author, there is probably no single article or book published in political science in recent decades that would not come across as a lesser contribution in comparison with Finer's work. Let me first explain why, by the standards I would have applied if I had not read Finer's book, I would have said that Wintrobe makes an important contribution to the study of an important type of regime (dictatorship) that has been understudied by public choice and rational choice theorists. Then I will suggest that Wintrobe's analysis of dictatorship is impoverished in a peculiar way, but my discussion should be understood as an indictment of public choice and rational choice scholarship rather than as a critique of Wintrobe.

Wintrobe is an economist, but his contribution should be judged on its substance and method, not the Ph.D. label of the author. In terms of substance, the topic (dictatorship) is political science. In terms of method, the public choice approach Wintrobe employs originates in economics but is now widely used in political science.

Wintrobe asks big, and good, questions about dictatorship. Under what conditions is it stable and longlasting, and when does it collapse? Does dictatorship promote economic growth? What economic and political constraints do dictators face, even those whose powers are nominally unlimited? What factors influence the degree of repression, and what "tools," other than repression, do dictators employ to stay in power? Under what conditions are dictators popular, or are forced to care about their mass appeal, what do they do to improve their popularity, and why are they often popular? How do dictators inspire loyalty among their subjects and in particular their supporting bureaucracy? What can we say about the complicity of mid-level bureaucrats in a regime that does evil? How do dictatorships interact with other governments in the international arena, both on the security dimension (war) and the economic dimension (international trade)? How does economics (free markets) interact with politics (democracy)? How does nationalism enter into the

Wintrobe covers a number of recent dictatorships, some of them in detail, others in passing: Nazi Germany, the communist government in the former Soviet Union, the apartheid system in South Africa, the Pinochet regime in Chile, the ancient Roman empire, Mobutu's Zaire, and Haiti under Papa Doc Duvalier.

The public choice analysis in this book is valuable for several reasons. First, precisely because dictatorships often are "accounted for" in terms of the irrational and mysterious behavior of their leaders and followers, it is quite interesting to see a public choice account that tries to make sense of it all in terms of rational, goal-oriented, and constrained behavior. Second, precisely because Wintrobe offers an account that parallels the rational choice account of democracy, his analysis allows us to see parallels between dictatorship and democracy. For example, like democratically elected politicians, dictators have to respect economic and political con-

straints. They do not fear getting voted out of office, but they do fear getting "rioted" or "military couped" out of office. Just as democratically elected politicians do certain things to improve their chances of re-election, dictators do certain things to reduce the likelihood of riots and military coups. Third, precisely because Wintrobe is an economist, the background literature he uses differs (with some overlap, obviously) from the literature a mainstream political scientist would draw upon, and for this reason he taps into ideas and ways of thinking about dictatorship that are relatively unusual and original.

In terms of method, Wintrobe's approach is the standard microeconomics of an earlier generation of public choice theorists (as represented by Hal Varian's microeconomics textbook), rather than the game theory employed by today's generation (as represented by David Kreps's microeconomics textbook). Wintrobe's theory does not reflect the methodological progress that has been achieved as theorists have moved away from public choice theory and embraced rational choice theory: It is impoverished in a peculiar way.

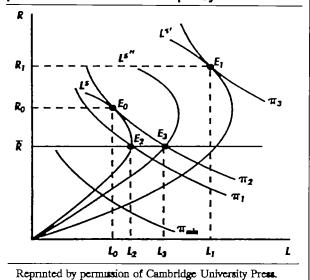

To see this, consider his Figure 3.4 (Equilibrium repression and loyalty under a totalitarian regime), which depicts the political constraints on the dictator's power. The x-axis reads \hat{L} for loyalty, the y-axis R for repression. The dictator maximizes power, which depends on loyalty and repression. The isopower line in Figure 3.4, labelled π , captures the combinations of repression and loyalty that generate the same level of power; that is, the dictator is indifferent between combinations of loyalty and repression on a given isopower line. The backward-sloping line in the figure, the loyalty/repression curve, captures the "supply of loyalty" constraint under which the dictator is laboring. It shows what happens as dictators increase the degree of repression. Initially, their subjects respond with more loyalty but eventually with less. The optimal degree of repression is achieved at the point at which the loyalty/repression curve touches the highest attainable isopowerline; this combination of loyalty and repression maximizes the dictator's power subject to the supply of loyalty constraint.

The uninitiated may consider this silly but political scientists who have suffered through Microeconomics 101 will know better. Wintrobe "derives" his story with reference to the substitution and income effect in economics. According to standard consumer theory, people's utility decreases with the number of hours worked (or, equivalently, increases with the number of leisure hours), and it increases with the goods and services they can buy with their income from working. As wage rates increase, people respond by increasing their labor supply. This is the substitution effect: They substitute labor for leisure because work has become, quite literally, more "worthwhile." As their income increases, however, they eventually decrease their labor supply. This is the income effect: They substitute leisure for labor because the marginal utility of the additional things they can buy with additional income declines and eventually drops below the marginal utility derived from additional leisure time.

There is something "only an economist" about the way Wintrobe relabels the standard microeconomics axes (leisure and labor become loyalty and repression), bases his assumptions on empirical references to repression under the Nazi regime and the Stalinist purges of the late 1930s, and calls the whole thing a theory of dictatorship. But we need to look at what the theory predicts.

Suppose the dictator's polity is hit by an exogeneous shock, such as an increase in the rate of economic growth, as depicted in Wintrobe's Figure 3.5 (How equilibrium levels of repression and loyalty under a totalitarian regime are af-

FIGURE 3.5. How equilibrium levels of repression and loyalty under a totalitarian regime are affected by changes in economic performance and Western policy

fected by changes in economic performance and Western policy). Under certain conditions (assumptions about the mathematical properties of the underlying functions), the dictator can move onto a higher isopower curve. At the new point of tangency, E1, the dictator represses more, gets more loyalty in exchange, and becomes more powerful. It is hard to know what to make of this prediction, since the story does not provide an account of the mechanism by which things happen (and the analogy to the income and substitution effect in consumer theory is not helpful).

The deeper problem is that Wintrobe makes use of the standard microeconomics verbiage, which invokes individual maximization, but does not derive the response of the dictator's subjects to repression from individual maximization. Instead, he works with a "reduced-form" loyalty/repression function. This kind of analysis was typical of an earlier variety of rational choice theorizing (called public choice theory), but today it seems wanting.

Furthermore, rational choice theory itself, of whatever variety, is an impoverished framework for understanding dictatorship. To see this, consider one of the most fundamental questions we can ask about dictatorships that rely on an extensive bureaucracy and some degree of mass loyalty to do evil (the Nazi regime obviously comes to mind). What is the criminal responsibility of the mid-level bureaucrat who, in worauseilendem Gehorsam, implemented the orders the dictator never put down in writing? Why did so many ordinary people go along, even though they were often not coerced, and in many cases people who refused to go along met with no punishment?

According to Wintrobe, the Nazis used the principle of competition to organize terror and murder: A competitive entrepreneurial bureaucrat embedded in a competitive bureaucracy ends up going along with evil. I believe there is something to this hypothesis (competition has a way of suspending people's moral sense, as in "everyone else is doing it"), but rational choice theory does not explain this phenomenon. (Within rational choice theory these questions are meaningless: what is the moral sense? what does it mean for it to be suspended?) Rational choice theory can say

something about the incentives ordinary people face, and at the margin it can say a little bit about why ordinary people on some occasions do evil and on other occasions recoil from evil or even do heroic things to topple evil. In other words, the benefits and costs of doing one thing or the other change over time or differ across situations. But it cannot explain why different people respond differently to the same incentives, or why ordinary people do evil out of indifference or inattention, or why they act heroically when the probability that their enormously costly action will make a difference is close to zero. People are driven not only by incentives; to understand why ordinary people do evil, and so on, there is no alternative to studying the psychology and biology of people.

As in Finer's comparative history of government, we need to expand our horizons by looking at nondemocracies from the earliest times. Wintrobe's rational choice account of dictatorship comes across as a "thin simplification" when it is read in the context of 5,200 years of government. Again, the problem lies not so much with Wintrobe; rather, much of rational choice theory could be improved quite a bit by an infusion of history.

Between the Flag and the Banner: Women in Israeli Politics. By Yael Yishai. Albany: State University of New York Press, 1997. 292p. \$54.50 cloth, \$17.95 paper.

Hanna Herzog, Tel Aviv University

This is an excellent textbook for the reader who is not familiar with the subject of women and politics in Israel. It presents, clearly and concisely, a coherent picture of the situation of women in Israel from a liberal feminist perspective. The book is unquestionably a vital source for data about women in Israel. It offers a broad survey of the current situation but also sets it in the perspective of the changes that have occurred since the state's establishment and does not neglect the prestate situation. My remarks cannot describe the wealth of findings and the nuances with which they are analyzed. Interested readers are invited simply to peruse the book, and I am certain they will be amply rewarded. My focus is on the theoretical aspect of Yishai's study and its contribution to furthering our understanding of the situation of women in Israel.

The democratic-liberal paradigm, although not declared, underlies the author's theoretical presuppositions and dictates the logic by which the material is organized, presented, and analyzed. The first section provides a comprehensive picture of the place of women in political institutions and associations, based on the thesis that the interests of organized groups are represented in political institutions and organizations. The guiding question is whether women are represented at all levels of Israeli politics and whether the political organizations represent women's interests. The picture that emerges is that the level of women's representation in the political elite is low, and that women who enter politics are not committed to furthering the interests of women.

The second theoretical element in the democratic-liberal paradigm is the electorate. The assumption here is that the interests of the voters, their collective identity, and the scope of their participation will, ultimately, determine who is elected and the interests they will represent. In other words, the size of the gender gap affects the degree of women's representation in the elite. Therefore, the second part of the book examines the scale of women's participation in politics as compared to men and reaches the conclusion that women

are less involved in politics than men. This disparity is more pronounced in Israel's Arab population than among the Jewish population. As for identity, the findings show, in a rough generalization, that women define themselves primarily on the basis of national rather than gender affiliation. At the same time, the author identifies a deepening of the gender gap in various spheres, a development she calls "feminism without feminists." The concept of equality is trickling down, but gender-based organizing and the rise of a feminist identity show few signs of intensification.

Policy and legislation are the output of the democratic thrust and constitute the third element in the paradigm Yishai has adopted. The subjects examined are legislation in the spheres of labor, the family (particularly laws relating to marriage and divorce, which in Israel are geared to the demands of religious bodies), violence against women, and abortion. The interesting finding is that while not responding to feminism, the authorities have been increasingly aware of the problems exercising feminists. This finding remains unexplained, mainly because the author deals with formal political order and its manifestations.

The theoretical framework goes a long way toward dictating the explanations offered. According to Yishai, along the continuum on which democracies extend in the Western world, ranging from "service state" to "visionary state," Israeli democracy is situated on the side of the visionary state. In her conception, the Western democracies are more compatible with the model of the service state, which is guided by the need to respond to the public mood and assuage grassroots pressures in order to stay in power. Israel fits more closely the model of the visionary state, which emphasizes general goals and is based on mobilization and socialization. "In a visionary democracy," the author explains, "there is constant tension between the collective imperatives of society and particularistic needs of subgroups within it, including women" (p. 7).

From this point of departure, the title of the book encapsulates its entire theory and thesis. Women in Israel are trapped between the flag of the missions that the state has set itself, namely, security and the "ingathering of the exiles," and the banner, which represents the goal of equality for women. In the terms of political theories, then, women in Israel face the alternative of integration within the existing frameworks or mobilization in the cause of their distinctive interests. The book's general conclusion is that between the national flag and the feminist banner women have opted for the former, and it is here that the source emerges for the gender inequality that prevails in Israel.

Faithful to her theoretical approach, Yishai presents findings that support her explanations. Her documentation of the dominant rhetoric that excludes women from politics in Israel is so successful that she herself falls captive to it. Many feminist theoreticians have noted that the clash between two ostensibly opposing conceptions—the interests of the society and the interests of women—is a product of social construction of reality and ideological manipulation. Why are the needs of women, who constitute half the population, consid-

ered particularistic needs of a subgroup? In accepting the political system as a given, the author acknowledges the division between the private and the public as self-evident and ignores the claim that it is socially constructed and historically constituted. As many scholars have indicated, the private-public dichotomy serves as a good excuse to exclude women from politics, as does the perceived conflict between society's needs and women's needs. Both are sociopolitical frames that enable this exclusion to take place.

Yishai's description and her explanations are fine for limning the picture of the gender inequality that exists in Israel, but what is missing is a critical analysis. If this book had been written at the end of the 1970s or even during the 1980s, I would spare no praise for the achievement. In light of the ramified literature that has been added to the bookshelf of political science and political sociology, however, one can only wonder about the author's disregard of the theoretical criticism that views acceptance of the existing order as self-evident as the main barrier to social change. Such studies exist both in the wider academic community and in Israel. Moreover, Yishai quotes such works but ignores their basic theoretical thesis. For example, she refers to the eminent theoreticians Susan Okin (Women in Western Political Thought, 1978; Justice, Gender and Family, 1991) and Carole Pateman (The Disorder of Women: Democracy, Feminism and Political Theory, 1989) in order to describe the dichotomy between the public and the private, but she ignores their critique of the gendered structure of that dichotomy. In the same vein she ignores the critical aspects of works on women in Israel (e.g., Hanna Herzog, Realistic Women: Women in Local Politics, 1994, and the Hebrew version of Herzog's Gendering Politics, 1999; and Deborah Bernstein, The Struggle for Equality: Urban Women Workers in Prestate Israeli Society, 1987, and Pioneers and Homemakers: Jewish Women in Prestate Israeli Society, 1992).

It is apparently no accident that the author frequently uses the term "sex" in place of the appropriate word, "gender." The book takes no notice of the shift that has occurred from sex to gender in scholarly and social thinking. It bears recalling and emphasizing that the term "gender" signifies that the distinction between the sexes is first and foremost a social construct, which becomes institutionalized and creates a gendered regime of thought and of social order. The potency of this social construct, which is founded on a hierarchical dichotomy of power relations between men and women, derives from the fact that it is presented as "natural" and "congenital," and hence as self-evident. The assertion that the gendered distinction is a product of the social construction of reality voids the ideological argument that the existing order is universal or necessary. The questions that arise are how the gendered world is structured and what are the social and political mechanisms that reproduce it. Yet, the way women in Israel think about themselves and their society and the way Yishai tries to cope with her findings are still captive to the old conceptions. The result is that the book, like its subjects, remains trapped between the flag and the banner.

International Relations

The German Problem Transformed: Institutions, Politics and Foreign Policy, 1945–1995. By Thomas Banchoff. Ann Arbor: University of Michigan Press, 1999, 217p. \$44.50.

Joyce M. Mushaben, University of Missouri-St. Louis

Applying an historical-institutionalist framework, Banchoff posits that the Four Power regime, North Atlantic Treaty Organization (NATO), the European Union (EU), and the Commission on Security and Cooperation in Europe/Organization for Security and Co-operation in Europe (CSCE/ OSCE) developed a capacity to shape West German foreign policy outcomes well beyond the "circumstances of their creation" (p. 2). Chapters address "The German Problem Transformed," "The Cold War and Integration," "Detente and the New Ostpolitik," "The New Cold War and the Intermediate Range Nuclear Forces Struggle," "Post-Reunification Foreign Policy," and "History and German Foreign Policy." The book ends with a mere six-page appendix on "The GDR and the German Problem," although a major constraint the FRG faced between 1949 and 1989 was the realization that any action undertaken vis-à-vis Moscow or Washington held consequences for its eastern "Siamese

The central construct of the book, foreign policy path dependency, merits extensive theoretical exploration, but the author supplies only one footnote (three sources, p. 2, p. 11; the term then disappears until pp. 165-6). There is little new empirical evidence that when Germany really was "free" to choose its own path, it consciously violated its national interests by not going it alone, due to external constraints. A continuous stress on the great men of history, for example, the "different perceptions of international realities and the lessons from the past" and "priorities espoused by rivals for the chancellorship" (p. 16), seriously obscures the focus on institutionalism. One wonders what "institutional constraint" led to the fact that Hans-Dietrich Genscher was "not even informed" (p. 159) in advance of Kohl's November 1989 Ten-Point Plan for Germany, although he had served as foreign minister for more than ten years, across Social Democratic Party of Germany/Free Democratic Party (SPD/ FDP) and Christian Democratic Union/Free Democratic Party (CDU/FDP) coalitions. Was the SDP deliberately excluded from unification negotiations merely to provide the Christian Democratic Union/Christian Social Union Party (CSU) with an electoral advantage in 1990 (p. 157) when something as important as the Nation was at stake?

Historical memory is reduced here to what select politicians say it is at any given point, and foreign policy "meaning" emerges out of contestations among party officials and government leaders. Collective-qua-national memory is actually a messy constellation of selective, subjective, and even counterfactual reconstructions of experience, such as Germans "remembering" themselves as victims and survivors rather than as war perpetrators or collaborators. Adenauer and Schumacher experienced two world wars; Brandt and Schmidt participated only in World War II, as a resistance fighter and Wehrmacht soldier, respectively. Kohl's experience was limited to attending Nazi-dominated schools; Scharping, Lafontaine, and Schroeder have no experience with real war, or real nationalism, at home. Yet, the effect of generational change is hardly mentioned.

The text takes extraordinary liberties with established terms of German political discourse. The author refers to the (confrontational) Ostpolitik of the Adenauer era, the New

Ostpolitik of the Brandt era, and the second New Ostpolitik of the post-1990 period. None of the classical studies I checked supports this conceptual stretching, which suggests policy continuity from Adenauer to Brandt. Adenauer's Deutschlandpolitik and exceptional, high-level appeals to Moscow were deliberately grounded in the politics of nonrecognition, no experiments, and negotiation through strength. Ostpolitik (not "the New Ostpolitik") was Brandt's explicit attempt to bring about change through recognitionqua-rapprochement (one has to accept the status quo in order to change it, a view initially opposed by the United States). Four years after Schmidt's resignation, the SPD initiated the second stage of Ostpolitik, grounded in its controversial Common Paper with the Socialist Unity Party (SED) of Germany (see Ann Phillips, "The West German Social Democrats' Second Phase of Ostpolitik in Historical Perspective," in Peter Merkl, ed., The Federal Republic of Germany at 40, 1989, pp. 408-41). SPD chief Scharping called for a new Ostpolitik after unification, not for "a second New Ostpolitik" (p. 159).

The treatment of sovereignty is equally problematic. On page one Banchoff declares: "The Germany that emerged after the [1989] collapse of the German Democratic Republic (GDR) is neither fully sovereign nor faced with a fluid balance of power abroad." But he asserts, without qualification, that "the Western allies granted the FRG its sovereignty as a member of NATO and the West European Union" (p. 26) following Adenauer's 1954 pledge to create a German army that renounced the production of ABC weapons. A country still militarily occupied until 1955 is not sovereign. Banchoff writes that the final withdrawal of armed forces by the "wartime anti-Hitler coalition" occurred after ratification of the 1990 Two-Plus-Four Accord, when "Germany finally secured sovereignty over its own affairs. It did not, however, exercise full sovereignty as a matter of practice" (p. 140). Here and elsewhere, the author conflates Germany's de jure status before/after 1990 with questions of strategic choice. He stresses Kohl's "readiness to include German Pershing 1A's in the December 1987 treaty" (p. 128), but this was symbolic politics, not a real choice. The Pershing 1A's were not the Germans' to concede, given the ban on ABC weapons. Grassroots peace groups knew that NATO's 72 1A's were obsolete, headed for replacement. Indeed, legal debates over the INF deployments (1983-84) produced a curious consensus at far ends of the political spectrum that Germany could not have blocked the Pershing II deployments no matter how the Bundestag voted, owing to the Reserved Rights of Allies.

The chapter on INF leaps from Franco-German ties, to Washington-Moscow relations, to the Historians' Controversy (which came after the deployments), to the biographies of Schmidt and Kohl. Yet, it virtually ignores new pressures imposed on external actors/institutions by German citizens themselves; the 1981 demonstrations impelled Reagan to shift to the double zero option, for example. FRG decision makers faced a sudden break in the 30-year taboo on public debate over NATO/military security dictates, triggered by the rise of counterexperts, including former General Kurt Bastian. Banchoff credits the INF outcome with having "spawned movement toward a greater foreign policy consensus at the level of German domestic politics" (p. 128), but surveys assessing the public's openness to arms control, Ostpolitik, and FRG-GDR relations show that a positive consensus had become firmly entrenched ten years before the INF treaty-Christian Democratic Union (CDU) hardliners were the ones who still had to be brought into the fold by 1987. The "polarization" constantly sensed by Banchoff stems from his heavy reliance on conservative politicians and historians as sources; of ten interviewees, seven are Christian Democratic Union/Christian Social Union (CDU/CSU) members, two are Social Democrats, and one is an Free Democratic Party official. Fixated on national soul-searching among conservatives, the author misses the real news emerging from the INF struggle: Despite the peace movement's "failure" to stop the Pershing II/Cruise deployments, Kohl and the German defense establishment had no choice thereafter but to lobby heavily for the 1987 INF treaty, which went farther in eliminating whole classes of intermediate nuclear weapons than PM-participants dreamed possible in the early 1980s. The SPD, for the record, did not officially terminate its support for double-track deployments until its Extraordinary Congress of November 17–18, 1983, three days before the Bundestag vote.

Subsequent treaties, one reads, render a "smaller Bundeswehr a more independent force than it had been in previous decades" (p. 141). In what respects? The Constitutional Court did sanction the use of German forces in "out of area conflicts" in 1993, but only within the framework of collective security systems and with the direct consent of the Bundestag. The court's institutional role in legitimizing yet limiting the application of the 1971 Basis of Relations Treaty, the 1991 Maastricht Treaty, and Gulf War involvement is barely mentioned; yet, in no other NATO or EU state do we find judicial institutions so powerful in dictating the parameters of foreign policy to a nation's commander in chief—and its allies.

The author stresses "continued restrictions on German sovereignty" (p. 140) resulting from the EU's common foreign and security policy after 1990, as if Germany's voluntary surrender of sovereignty by way of Common Foreign and Security Policy (CFSP) were comparable to forty years of restrictions imposed by way of conditionless surrender in 1945. Germany's response to conflict in the Balkans is said to have transpired within the context of the CFSP, when in fact its preemptive recognition of Croatia in December 1991 dragged the rest of the EU into reluctant acceptance of the Yugoslav secessions (the Maastricht Treaty/CFSP did not take effect until 1992).

We are told from page 2 onward that this is an "enduring transformation of the German Problem," only to confront the concluding question: "Will the postwar transformation of the German Problem persist in the future" (p. 175)? Something "enduring" must, by definition, "persist." This text posits a paradox where none existed by insisting that "no concerted effort to define and pursue specifically national interests took place" (p. 165). National interest in postwar Germany was never a question of sumply restoring "national unity" after 1949. Citizens recognized early on that their quintessential national interests—peace and prosperity—were best pursued within an international, mutilateral, and supranational context, and that a strategy of going it alone (Sonderweg) inevitably violates the national interest of Germans as a whole.

Condemned to Repetition?: The Rise, Fall, and Reprise of Soviet-Russian Military Interventionism, 1973–1996. By Andrew Bennett. Cambridge, MA: MIT Press, 1999. 387p. \$35.00 cloth, \$17.50 paper.

Philip S. Gillette, Old Dominion University

In this rich, dense book Andrew Bennett develops learning theory (LT) and uses it to explain Soviet and Russian military interventions from 1973 to 1996. In advancing LT, Bennett joins other scholars who emphasize ideational rather than material factors in foreign policy (e.g., Jack Levy, "Learning and Foreign Policy: Sweeping a Conceptual Minefield," International Organization 48 [Spring 1994]: 279–312). Indeed, the ideational concept "military interventionalism" (defined as the propensity of an actor to use force in varying contexts) is crucial to Bennett's argument that the USSR/Russia learned from intervention (and nonintervention) experiences (e.g., from successes and failures) in the form of raised or lowered interventionalism, which in turn shaped subsequent interventions and noninterventions (p. 14).

The major contribution of Condemned to Repetition? appears to be an outline of a comprehensive LT. Learning is defined as "change in cognitive structures as the result of experience or study"-on the individual, organizational, governmental, and international levels (p. 81). Bennett summarizes key dynamics of learning on each level of analysis and employs the first three levels to explain intervention. In showing how individual belief systems change, Bennett dwells on attribution biases, mechanisms of causal inference, processes of change in interrelated beliefs, and sources of variations in individual learning. Organizations, in contrast, learn when inferences from history are encoded into "routines that guide behavior" (pp. 98-9). Moreover, Bennett points out how organizational learning models differ significantly from bureaucratic process models. Finally, governmental learning involves change in the "content or robustness of the beliefs embodied in a state's behavior and institutions" (p. 105).

Generally, LT maintains that the lessons of history are debated among leaders seeking to build a governing coalition, and the winners in this debate will be those whose views appear to be validated by recent experiences (p. 357). Moreover, Bennett develops a model of learning to determine whether governmental learning can take place in reaction to a particular experience. The model yields sixteen possible paths or combinations depending on four variables: Do top leaders learn a particular lesson, do implementing organizations learn that same lesson, is the state strong on the issue in question, and do societal or opposition leaders draw the lesson (pp. 108–12). Bennett also adapts the model to the Soviet and Russian governments.

Bennett concedes that his LT yields outcome predictions of Soviet and Russian interventions "in only a very general way" (p. 124). For example, divergence between officials' expectations and their experiences should have led to learning, and this learning should have contributed to associated changes in behavior. At the same time, LT appears to be more specific in predicting processes through which learning should have taken place, a finding Bennett considers "not inconsequential" because this provides evidence on the causal mechanisms at work (p. 124). Among process predictions concerning Soviet and Russian interventions are expectations that Soviet peripheral or tactical beliefs (e.g., on the use of force) should have changed before core beliefs (on whether US relations were zero sum); once core beliefs changed, there should have been sweeping changes in many related beliefs. Another is that one should expect to find considerably more private learning by policy experts before Gorbachev's rise than was publicly acknowledged. Most important, according to Bennett, differences in lessons individuals learned should be traceable to their differing information sources and biases as well as to their material interests.

Bennett also makes a methodological contribution to the study of international relations by refining the method of "structured focused comparison of cases," pioneered by Alexander George, and by proposing a rigorous method for

testing a learning hypothesis (p. 12). This includes carefully defining the variables; selecting which cases to study among the opportunities for Soviet and Russian intervention, which to develop briefly for comparison, and which to leave fallow, asking the same questions concerning ideas about military intervention across the cases; using both written sources and interviews with Soviet and Russian leaders; comparing the explanatory power of LT with that of alternative theories; and employing process-tracing within cases to confirm the validity of the learning explanation (p. 31). Moreover, for ease of exposition Bennett defines three main schools of thought about intervention in the Soviet period (p. 30, Table 1.5), and three major schools of thought on the use of force in the Russian period (p. 306, Table 8.1).

A third contribution is Bennett's detailed study of several cases of Soviet/Russian intervention: Angola in 1975, Afghanistan (entering in 1979, continuing during 1980-84, and withdrawing in 1989), and Chechnya during 1994-96. The cases form the foundation for Bennett's key contentions that the learning explanation of intervention (1) outperforms the alternatives on key points where they disagree and (2) helps resolve these alternatives' anomalies on points of comple-

mentarity (pp. 5, 351-67).

The case studies are on the whole admirable, but the study of Russia's decision to intervene in Chechnya in December 1994 suffers from some weaknesses. First, much less information is available than on the other cases, which must render many of Bennett's conclusions tentative. Second, the author mistakenly states that the hawkish colonel General Andrei Nikolayev was promoted to Minister of Security in July 1993 (p. 325), when in fact Nikolayev was named Chief of Border Troops, which he continued to head after December 1993, when it was reorganized as the Federal Border Service (Amy Knight, Spies without Cloaks: The KGB's Successors, 1996, pp. 67, 82). Finally, Chechnya was arguably not a foreign country, as is required by Bennett's definition of intervention: "the use of military force in an intrastate or interstate conflict of a foreign country with the objective of influencing the makeup, policies, stability, or strength of the regime in that country" (p. 14). Moreover, two of the book's briefly developed cases involved intervention against quasistates or nonstates within the intervener's borders: the Soviet limited intervention in the Baltic republics in early 1991 and the Russian small-scale intervention in North Ossetia in fall 1992. Consequently, a reformulation of this book's dependent variable may be in order.

These reservations notwithstanding, Bennett makes a major theoretical and a minor methodological contribution to the study of international relations, particularly by developing a LT and showing how it both complements and contradicts major theories of international relations in explaining Soviet and Russian military interventions. Henceforth it will be difficult, if not impossible, to explain interventions without taking into account both learning and interventionalism.

Community under Anarchy: Transnational Identity and the Evolution of Cooperation. By Bruce Cronin. New York: Columbia University Press, 1999. 176p. \$49.50 cloth, \$18.50 paper.

Patrick M. Morgan, University of California, Irvine

Springing now from constructivist impulses is a strong interest in the nature, scope, and influence of identity in international politics. Various studies, such as Bill McSweeney's Security, Identity, and Interests (1999), and the book under review attempt to bring the concept of identity to bear on

problems of security, descending from Alexander Wendt's speculation on the development of international identities in a hypothetical state of nature ("Anarchy Is What States Make of It: The Social Construction of Power Politics,' International Organization 46 [Spring 1992]: 391-425).

Cronin's theme is the way political elites construct transnational communities to enhance security in international politics through cooperation, a departure on their part from supposedly standard behavior under anarchy. The construction of community amid anarchy is old territory, investigated in integration theory years ago and in even older forms of liberalist analysis. Here it is reexplored via a constructivist approach that extrapolates to states some perspectives on individuals and groups offered in social identity theory (SIT) in psychology and symbolic interaction sociology (SIS). The argument is straightforward and very clearly set forth: Like individuals, states develop multiple identities, and some are more salient than others at any one time. The identities grow out of interactions with "others," which is how identity is formed. When states share an important characteristic, have some distinctive or exclusive feature in their relationship, have a strong and very positive interdependence, and gain substantial experience in acting together, they are likely to develop a transnational identity. Within such an identity they find norms, other boundaries to behavior, and goals; in such a context states develop recognizable roles, and cooperation is facilitated, often through institutionalized arrangements. Cronin explicitly challenges Jonathan Mercer's contention (Reputation and International Politics, 1996) that SIT explains why states will normally be suspicious of each other and will find it very difficult to cooperate.

Cronin suggests that the type of transnational identity essentially determines (identifies is perhaps a better word) what transnational community emerges. Two security arrangements display minimal community: a state of nature and a balance of power. There are five true security communities: a great power concert, either amalgamated or pluralistic security communities, a common security organization, and a collective security system. Each rests on a different transnational identity shared by the members. To illustrate how this approach should be used, Cronin provides three nineteenthcentury case studies: the formation and operation of the Concert of Europe (and the Holy Alliance), plus the coalescence of many actors into what became Germany and Italy.

All this is laid out simply and clearly. The writing is accessible and confident. Cronin makes no claim that other perspectives are irrelevant or that international politics has but one pattern. "Constructivist theories do not attempt to refute material and rationalist-based explanations as much as they seek to expand them" (p. 131). The book is a fine resource for anyone seeking to illustrate how constructivist analysis works or how to use analysis at one level to derive insights at other levels.

Brevity has its drawbacks, of course. Many elements deserve more extended treatment or a more extended defense. An example is the central notion of transnational identity. Such a complex phenomenon must defeat resistance from domestic identities, plus the effect of sovereign autonomy and anarchy, so we might expect it to form only gradually. Yet, Cronin cites examples of its rapid emergence, which is hard to explain. One possibility is that, because interaction is so important for stimulating a transnational identity, operating a great power concert (for instance) has as much to do with generating a congruent identity as the reverse. This might help explain why security communities can emerge so rapidly at times; they do not always have to be preceded by a transnational identity, just the seeds for one. If so, then we

would need to search for what sets off the interactive process. Creative, courageous statesmen? A fortunate conjunction of events? Shifts in the sociocultural context?

Similarly, more work is needed on variation in transnational identities. For a concert, the author cites a corresponding identity based on great powers' mutual recognition, but this does not readily distinguish a competitive from a cooperative great power set. A common security association is said to rest on an identity in shared regime type or ideology, but this might well apply to effective long-term great power concerts and perhaps to most pluralistic security communities. Cronin cites a sense of "regional identity" as the basis of a pluralistic security community, but this has been important to European integration, has been cited as one basis for the Concert of Europe, and is almost surely a contributor to a regional collective security system. This problematizes the hypothesized links between specific security associations and transnational identities.

Cronin suggests transnational identities are likely to emerge during social and political upheavals, as creative adaptations in times that allow for new thinking and new social arrangements. This is a very interesting contention, because the standard concern now is that such times drive people to turn to primordial ties either domestically or on an international plane in ways that often diminish prospects for a security community. Thus, we need to consider when upheavals produce which sort of identity and why.

Is a security community the product primarily of a suitable transnational identity? Or, as integration theory or some theories on alliances and multilateralism suggest, does it emerge alongside, reinforced by, other transnational communities (political/ideological, economic, cultural) or even descend from them? At least two broad lines of thought offer alternatives to the Cronin analysis. The standard liberalist view, now reinvigorated (Etel Solingen, Regional Orders at Century's Dawn, 1998; Jeffry Frieden and Ronald Rogowski, "The Impact of the International Economy on National Policies," in Robert Keohane and Helen Milner, eds., International and Domestic Politics, 1996; Helen Milner, Interests, Institutions, and Information: Domestic Politics and International Relations, 1997; and others), holds that high levels of interaction, particularly economic, build overlapping national interests reinforced by the rising political leverage of domestic groups that are the main beneficiaries. Alternatively, in the democratic peace thesis, transnational community results from a shared type of political system regardless of the level of interaction, which seems relevant, since so many successful security communities have arisen among democratic nations.

In short, this book can help open up students' minds and our own. It is too brief a treatment of a very large and very compelling subject these days to offer all the answers, but it provokes interesting questions.

Paths to State Repression: Human Rights Violations and Contentious Politics. Edited by Christian Davenport. Lanham, MD: Rowman & Littlefield, 2000. 248p. \$69.00 cloth, \$24.95 paper.

Conway W. Henderson, University of South Carolina at Spartanburg

This book joins a legacy of quality edited works that have focused on the study of political repression. Each volume, at its time of publication, has indicated how far this study has advanced in approaches and methods. Christian Davenport recruited eight original and useful essays mostly by political scientists, some of whom are among the leading researchers

in repression studies. These essays range from case studies of one or two countries to aggregate projects at the regional and global level. The primary question that guides the contributors is why governments repress their own peoples. A secondary question concerns how a reciprocal relationship, between governors and governed, affects repression.

Together, Davenport's collaborators help bolster recognition of political repression as a discrete phenomenon that deserves status as a subfield of both human rights and conflict studies. Specifically, these authors help clarify that repression is the violation of the integrity of the person. When opposition rises, many governments respond with tools ranging from intimidation to political detention, torture, and murder. Some of the writers also reinforce the conclusion reached by others that structural conditions, especially democracy and economic level, as well as social forces, such as war and rapid development change, are now standard control variables that discourage or encourage repression.

Several special innovations deserve highlighting. James Scarritt and Susan McMillan find evidence in African cases that long-term democratic traits are better for a future stable democracy than a quick transition from an authoritarian government to full democracy. Kathleen A. Mahoney-Norris, in an exemplary comparative study of Cuba and Nicaragua, discovers not only that ideology influences repression, but also that different versions of the same ideology, socialism in this case, can have differential outcomes for repression. In an interesting twist, the focus of George Aditjondro et al. is not on targeted opponents of government but on the part of the government that the opposition selects for protest. Finally, a more realistic portrayal of repression is available, according to John C. King, if we can statistically account for the interaction of variables as they perform in a model rather than rely on the usual additive model. He promises more explanatory power with the same variables.

A recent edited book can indicate the level of accomplishment in the study of political repression and at the same time reflect what is not accomplished. Except for particularized gains, the editor and contributors do not move us much beyond the loose repression research framework already existing. The articles are as eclectic in nature, regarding approaches and methods, as is the broader study of repression. Given the book's title, the editor may have welcomed eclecticism and then received it. A useful addition by Davenport would have been a final chapter setting out a research agenda. Researchers need not grope about blindly, however. Short of a theoretical breakthrough that would permit a simple model of a few variables, the best option might be to follow the template of Steven C. Poe et al., who report on the most comprehensive repression models to date regarding the number of variables and cases. Their contribution in the Davenport book is a refinement of their earlier work. In the present effort, they demonstrate that human rights abuses tend to persist for a time beyond the life of the threats perceived by the government.

A small caveat is in order, however, if we follow the worthy example of Poe and his colleagues. Sometimes articles, heavily dependent on quantified data and statistical analysis, appear to benefit only a small academic community. It is important to find ways to condense some of the more technical aspects of research and focus on effective description if we are to reach beyond political scientists. From a normative perspective, specialists in political repression should want research results to serve as useful intelligence for the policymaking community, made up of international lawyers, staffs of foreign ministries and international government

organizations, and human rights activists. It is these people, after all, who do the everyday work to stop repression.

One volume cannot be expected to cover all the questions about repression, but several other topics easily could have been added. Although the predator-prey model of Chris Lee et al. is intriguing, a more thorough investigation of instinctual theory and repression could be useful. A model based on instinctive behavior would be a direct challenge to the assumption of a rational decision maker that operates behind most models of repression. Perhaps repression is so difficult to explain and predict because leaders act out of fear based on a drive for survival rather than make careful calculations we identify with war and chess. Or perhaps culture can explain much of the variance in repression that today's models are missing. Precolonial African chiefs sometimes applied a maintenance dosage of repression even in quiet times. Torture has had a historical role in Iran regardless of the type of government in power. Inducing respect for authority by means of fear may be a continuous cultural motive.

Another question concerns whether repression travels well across borders, as do civil disobedience tactics, corporate restructuring, and military weaponry. For instance, when one Latin American country turns to military rule and repression, does it influence other countries to do likewise? Also, did repression reach a plateau with twentieth-century totalitarianism and is now in historical decline? Finally, a contribution from someone associated with Ted R. Gurr's minorities-atrisk project would have been highly useful. With ethnic politics so contentious, one ethnic group in power and others in the opposition is a confrontational dyad ripe for repression, if not genocide.

Although this edited work does not offer bold advances in either theory or methods, it is a treasure-trove of useful articles right with references. Most repression research of the future will undoubtedly cite *Paths to State Repression*. This book will further enhance Davenport's reputation as a leading scholar in the field of political repression.

In the Shadow of the Garrison State: America's Anti-Statism and Its Cold War Grand Strategy. By Aaron L. Friedberg. Princeton, NJ: Princeton University Press, 2000. 362p. \$69.50 cloth, \$21.95 paper.

Benjamin O. Fordham, University at Albany, SUNY

Most international relations scholars would probably agree that a relatively greater ability to mobilize and direct societal resources makes a state more likely to prevail over its international rivals. From this perspective, the outcome of the Cold War is a paradox. Compared to their American rivals, Soviet leaders were better able to extract national resources and direct them to military purposes, a task they pursued assiduously throughout the Cold War. In spite of-or perhaps because of-their efforts, the United States emerged victorious. Aaron Friedberg argues that the American state ultimately drew strength from its inability to mobilize and direct societal resources to the extent that some argued was warranted by the Soviet threat. He attributes this curious source of power to the structure of American institutions, the power of entrenched antiinterventionist interests, and above all to a long-standing ideological tradition of antistatism.

Friedberg begins with Alan Milward's concept of a "strategic synthesis" that balances military needs against the

economic and political costs of mobilization (War, Economy, and Society, 1939-1945, 1977). He examines how the American state extracted (and failed to extract) money and manpower and directed (or failed to direct) industrial development, arms manufacture, and technological development in order to confront the Soviet threat. Friedberg devotes a chapter to each of these areas of direction and extraction. In each case, he finds that executive branch policymakers were unable to enhance the power of the state to the extent that many of them believed necessary. The divided structure of the American government and the interests of powerful groups unwilling to bear the costs of further mobilization contributed to the opposition, but Friedberg assigns the greatest weight to an antistatist ideological tradition. Critics of greater state power were able to use the symbols of this tradition not only to build broad support for their position but also to raise doubts in the minds of state leaders themselves about the wisdom of greater extractive and directive authority. In the end, many of the U.S. arrangements turned out to hold substantial advantages over the more statist alternatives the Soviets pursued.

Friedberg does not question the seriousness of the Soviet threat, but his account raises some crucial questions about treating U.S. Cold War strategy as a straightforward response to it. He shows that decisions about resource extraction for military purposes directly affected many other policy matters, and he makes it clear that international threats were only one influence on these choices. Although the response the Soviet threat really required was generally ambiguous and contested, the implications of national security policy choices for matters such as taxes and budget deficits were usually very clear. Moreover, domestic concerns like these often predominated even when there was a broad consensus within the executive branch that the international threats demanded more direction or extraction by the state. Dwight Eisenhower's acceptance of a strategy that assumed a war with the Soviet Union would be short—a premise he did not really believe—is a particularly striking and important example (pp. 130-3, 222-5). Similarly, continuing fiscal constraints and other spending priorities helped prevent great increases in the military budget when the Kennedy administration shifted to a strategy of flexible response (pp. 139-48).

Friedberg shows that, in addition to the inevitable intrusion of other policy matters into strategic decisions, strategy was often an outcome of domestic political bargaining rather than strategic calculation by state decision makers. Key elements of the strategic synthesis were compromises that did not really satisfy any of the major parties to the debates that produced them. For example, selective service emerged from a political struggle between those who wanted universal military training and groups opposed to all forms of conscription (pp. 149-98). Neither side wanted selective service, but it persisted for more than twenty years. Similarly, Friedberg shows that the United States developed competing institutions for scientific research, an arrangement that turned out to have unexpected advantages, more by accident than by design (pp. 296-339). In general, Friedberg persuasively argues that American strategic decisions had as much to do with their domestic implications as with their international purposes and are best described as "resultants" rather than 'choices." In doing so, he calls into question accounts of foreign policy that treat it as the result of rational calculation by the state and strategic interaction with international adversaries.

Despite its strengths, the book is not without limitations. Its stress on the role of antistatist ideology in limiting the development of the national security state explains the first

half of the Cold War better than the second. The fact that avowed antistatists like Ronald Reagan later supported the expansion of state power for military purposes is puzzling from this perspective and requires further explanation. Also, Friedberg's praise for the American strategic synthesis in the final chapter relies on the assertion that the only likely alternative was more statist, not less. This contention rests uneasily with the book's evidence that those who wanted to give the state even fewer resources and prerogatives were politically strong. (Indeed, without a number of well-timed international events, these antistatists might have prevailed.) In view of American success in the Cold War, it is hard to argue that the state required additional resources and authority in order to compete with the Soviets. The book does not demonstrate that the same outcome could not have been produced with less extraction and direction by the state. These limitations do not obscure Friedberg's contribution. This is a very good book, one that is sure to be read with interest by anyone interested in the domestic politics of foreign policy, the linkage between war and state-building, and American foreign policy.

Doing Good and Doing Well: An Examination of Humanitarian Intervention. By Stephen A. Garrett. Westport. CT: Praeger, 1999. 213p. \$55.00.

Herbert K. Tillema, University of Missouri, Columbia

Humanitarian intervention is a controversial old idea that attracts new interest in the post-Cold War era. The notion justifies some foreign military operations that purport to arrest harm to human life. The conception is fundamentally controversial because it claims exception to the general assumption that modern international law and diplomatic practice proscribe coercive interference among sovereign states. Specific applications of the label often provoke controversy due to disagreement about the motives and consequences of particular military operations. Nineteenth-century apologists for British foreign policy were among the first to proclaim a general legal right to intervene for humanitarian purposes. Some twentieth-century statesmen have claimed similar rights upon occasion, frequently in an effort to justify otherwise questionable foreign military ventures. The issue has gained increased attention lately, especially in the context of numerous actual and proposed multinational military missions that are supposed to express global and regional community interest in peace and other human rights.

Humanitarian intervention and international peacekeeping are not necessarily the same. Most peacekeeping missions authorized by the United Nations or other regional organizations profess impartiality with regard to all issues other than peace; they typically restrict military operations according to the wishes of established governments within whose territories they deploy. Humanitarian intervention, in contrast, often openly opposes abusive policies of established governments and does not necessarily abide by governmental restrictions. Garrett defines humanitarian intervention as "the injection of military power—or the threat of such action—by one or more outside states into the affairs of another state that has as its purpose (or at least as one of its principal purposes) the relieving of grave human suffering" (p. 3).

According to this definition, humanitarian interventions are relatively rare. Garrett further concentrates attention upon a small number of recent events in which intervenors

explicitly claim humanitarian purposes. These include U.S. intervention in Panama in 1989; U.S. intervention in Haiti in 1994; French interventions in the Central African Republic in 1979; French intervention in Rwanda in 1994; Indian intervention in East Pakistan in 1971; Tanzanian intervention in Uganda in 1979; and Vietnamese intervention in Cambodia beginning in 1979. A few recent multilateral operations are also discussed, such as efforts to secure safe havens for Kurdish refugees in northern Iraq beginning in 1991, UNapproved food supply in Somalia in 1992, and intervention in Liberia beginning in 1990 under authority of the Economic Community of West African States. Other missions aimed merely at promoting impartial peace are conspicuously and deliberately excluded from this analysis, including foreign military operations within former Yugoslavia during the 1990s.

One strength of Garrett's work is a plausible perspective upon foreign policy decision making. Whether a state resorts to humanitarian intervention requires an opportunity in the form of a serious affront to humanity to which the state is capable of mounting response. Whether a state acts upon its opportunity may depend upon numerous and often competing situational incentives as well as various underlying factors. Self-interest and altruism do not necessarily define diametrically opposed alternatives. Weighty choices by modern governments, including decisions to intervene, seldom reflect merely a single purpose.

Normative evaluation of individual cases gains relevance by taking account of mixed motives among intervenors as well as by recognizing the frequently impure plight of victims. such verisimilitude complicates analysis, however. Garrett considers several moral standards. He particularly recommends a "principle of proportionality," which he attributes loosely to traditional just-war doctrine. The reader should be warned that this is not necessarily the same principle of proportionality as customarily claimed under modern international law to restrict other forceful actions, such as acts of anticipatory self-defense.

There is heightened interest lately in humanitarian intervention under multilateral authority. Several proposals under international discussion imagine a United Nations standby military force capable of ready action for humanitarian purposes. In February 2000, after this book was published, the European Council established the Interim Military Authority under the European Union and charged it to create a ready European intervention force. Garrett subscribes to the view that multinational intervention is generally preferable to unilateral action in most circumstances. He argues this position on both moral and practical grounds. Multilateralism arguably helps guarantee legitimate humanitarian claims against perceived or actual abuse by a single self-interested state. Similarly, collective judgment may be superior to that of a single state regarding whether a given situation warrants intervention. Multilateral humanitarianism is also said to maximize likely support, or at least likely acquiescence, among most interested states. Finally, it is asserted, multilateral intervention may be less likely to provoke and more likely to deter violent local resistance.

Garrett is ultimately sympathetic to the conception of humanitarian intervention and to its practice. He foresees increased reliance upon this instrument, particularly multilateral intervention, despite apparent misgivings within the United States.

Doing Good and Doing Well offers a useful introduction to an important current issue in international relations. It is not a rigorous treatise in international law comparable to Ian Brownlie's International Law and the Use of Force by States (1963). It does not include rigorous moral argumentation comparable to Michael Walzer's Just and Unjust Wars (1977). Also, it does not include, as it might have done, either a systematic historical survey or detailed comparative case studies. Nevertheless, Garrett provides competent and reasonable synopses of key elements of the issue, including moral evaluation, legal analysis, and historical commentary, combined within a consistent analytical framework. This book is a good place from which to begin serious evaluation of recent national and multilateral claims and proposals regarding humanitarian intervention.

Revolution and World Politics: The Rise and Fall of the Sixth Great Power. By Fred Halliday. Durham, NC: Duke University Press, 1999. 402p. \$59.95 cloth, \$19.95 paper.

Mark N. Katz, George Mason University

Many of the "great books" on revolution have been written by scholars who were primarily theorists and only secondarily (at best) area experts. These books usually begin with the exposition of a theory about revolution followed by three or more case studies that, the author claims, validate the theory. The principal criticism of this type of study is that the author has engaged in selective history, highlighting events or trends in the case studies that support his or her theory and ignoring those that do not.

Fred Halliday does not do this. He is not only a theorist of revolution but also a genuine area expert on the Persian Gulf region, and he is cognizant of the literature on other regions as well. Instead of being organized around case studies, the chapters in this book examine various themes, such as the export of revolution, revolutionary foreign policy, counter-revolution, war and revolution, and the systemic constraints on revolutionary regimes.

An extraordinary knowledge of the history of modern revolutions allows Halliday to demonstrate the shortcomings of other theories. In response, for example, to the argument by Stephen Walt (War and Revolution, 1996) about how revolution in one country can lead to international war, Halliday demonstrates that causation often occurs in the opposite direction: International war often creates favorable conditions for successful revolution. In this and other instances, Halliday appears less interested in proving existing theories wrong than in pointing out cases they do not adequately explain and providing theorization that does account for them. Although the book is not organized around case studies, the discussion is replete with examples from a plethora of cases.

What does not emerge is a simple, overarching theory about the relationship between revolution and international relations. The author's insistence on depicting the extraordinary variation in the many international dimensions of revolution prevents him from articulating one. Instead, Halliday identifies a set of problems that revolutionary regimes pose to the international system (and vice versa) and the patterns in which they are often (although not always) worked out.

For example, Halliday points out that some (but not all) new revolutionary regimes attempt to export their brand of revolution abroad—and usually fail. Some status quo powers (but not all) attempt to overthrow new revolutionary regimes; although they sometimes succeed, they usually fail. Some revolutionary regimes (but not all) attempt to separate from the international system and pursue an independent path to rapid economic development. This always fails, but whereas some revolutionary regimes have abandoned the effort relatively quickly, others pursue it doggedly for decades. In short,

there are regular patterns in the way revolutionary regimes interact with the international system, but there are also significant variations.

One shortcoming of the book is that it focuses almost exclusively on relations between revolutionary states, on the one hand, and status quo powers, on the other. A more complete account of revolution and world politics would seek to explain the highly complicated relationship patterns among revolutionary actors—such as between revolutionary regimes, on the one hand, and both revolutionary movements and other revolutionary regimes espousing the same ideology, on the other, and between revolutionary actors espousing different ideologies. These latter relations are important to study; sometimes (as with the Sino-Soviet rift) they become so hostile that they induce revolutionary regimes to seek varying degrees of alliance with the status quo powers they formerly despised. (But, as Halliday would point out, this does not always occur.)

Halliday is well known for being, especially in his early career, sympathetic toward revolutionary causes. At times this sympathy may lead some to question his scholarly detachment. In some cases, for example, Halliday does see revolution in one country leading it to war with others (as Walt argues), but he (unlike Walt) insists that the status quo powers are primarily responsible. For the most part, however, Halliday is merciless in identifying the shortcomings of revolutionary regimes, especially in chapter 10, in which he analyzes the disastrous consequences of attempting to delink from the rest of the world.

On the whole, Halliday provides a masterful overview of a very broad subject. Although he may not present a simple, elegant theory about revolution and international relations, anyone seeking to articulate one must first grapple with the challenges to such a theory posed by this book.

Our Own Backyard: The United States in Central America, 1977–1992. By William M. LeoGrande. Chapel Hill: University of North Carolina Press, 1998. 773p. \$45.00 cloth, \$24.95 paper.

William I. Robinson. New Mexico State University

Central America was in the spotlight of world attention from the 1970s into the 1990s and a major site of revolutionary challenge to international order. The appearance of guerrilla movements, the breakdown of the prevailing agro-export economic model, and the mounting civil strife in the 1970s ushered in a period of dramatic change. By the 1980s the region was engulfed in a general crisis: full-scale civil wars of revolutionary insurgency and U.S.-organized counterinsurgency, the collapse of the regional economy, and the demise of dictatorial forms of political authority. The 1979 Sandinista revolution in Nicaragua and near revolution in El Salvador thrust the isthmus onto the center stage of a rekindled Cold War. No less dramatic in the late 1980s into the 1990s were the peace and demilitarization processes under the mediation of international organizations, transitions to polyarchy, and economic restabilization under a new model of free-market capitalism.

The Central American crisis has generated an extraordinary amount of rich scholarship, and William LeoGrande makes an important contribution with his study of U.S. involvement in the region during this remarkable period. Intervention in Central America during the 1980s, as LeoGrande observes, was a centerpiece of U.S. foreign policy as it entered the critical transition period between the Vietnam War and the post—Cold War era. LeoGrande has

taken on the herculean task of chronicling, blow by blow, the unfolding of U.S. policy toward the region as it applied to Nicaragua and El Salvador. The result is a truly encyclopedic study, a meticulously documented and minutely detailed reconstruction of policy. To the best of my knowledge, the empirical chronicle is a faithful rendition of these historical events. It is also well written, almost literary in its style, and makes for engaging reading. I know of no other study from among welter of recent scholarship on the region that documents as much of the historical record on U.S. policy. The book is not a social scientific analysis; it is largely a descriptive chronicle. If that is what the reader is seeking, then this is a medullar volume and an essential—perhaps the—reference.

I do not wish these merits to get lost in a critique of substantial weaknesses, of which three stand out. First, as a chronicle, the book is bereft of a theoretical framework with which to organize the mass of description or to situate U.S. policy and inter-American relations. The narrative gets bogged down in so many trees that we lose sight of the forest. Page upon page, for example, tediously reconstruct the details of wrangling between members of Congress and the executive over the precise terms and amount of periodic budgetary appropriations for Central America. But these facts cannot speak for themselves. Any number of theoretical traditions from the social sciences could have served the purpose, such as sociology's world-system theory, with its notions of core powers and center-periphery relations; realist or constructionist theories of hegemony, interstate competition, and power dynamics from international relations; and approaches from international political economy that underscore the asymmetries driving international political and military conflict. Also, LeoGrande does not tap any theory to explain the internal dynamics of U.S. statecraft. Elite or managerial theory might have worked well, as LeoGrande is keen on drawing out institutional conflict and bureaucratic tussles within the policymaking apparatus.

In fact, the book does not really have a central argument. The closest we come to an analytical (let alone theoretical) framework is LeoGrande's claim that policy was the outcome of the schism between "hardliners" and "pragmatists," Republicans and Democrats, "reinforced by rivalries of ambition and personal animosity" (p. ix), a claim that guides the study. This may have some empirical validity and explanatory value, but events and outcomes cannot be reduced to the preferences of individual actors or decisions taken on the basis of role perception. Policymakers are not independent actors, and U.S. foreign policy cannot be explained by the specific views of individuals or by political positions taken at face value. LeoGrande's conclusion that "hardliners always prevailed . . . because they accurately reflected the emotional commitment of the president himself [Reagan]" (p. 581) is simply an untenable explanation for historical events of the magnitude of U.S. intervention in Central America in the 1980s. Beneath this surface level of analysis to which LeoGrande's study is limited lie more fundamental historical processes and structural forces that shape and situate the surface political behavior of actors and that ultimately informed U.S. policy.

The study's empiricism is related to its second major flaw. It is a politically compromised account. Political commitment in a scholarly work is not necessarily a weakness. The notion of the value-free intellectual is a myth; there is always a normative structure that underlies scholarship. But the implicit political commitment in LeoGrande's study is a liability because it prevents a more

complete understanding of what drove U.S. policy and a more accurate analysis of the divisions within the U.S. power structure that embroiled policy toward Central America. LeoGrande worked from 1982–86 on the staff of the Democratic leadership in Congress, dealing specifically with U.S. policy on Central America. If this experience made him well placed to chronicle policy it also may have prevented him from offering a perspective more distanced from the liberal Democratic interpretation of this area of U.S. foreign policy. Such a perspective might have been achieved had LeoGrande been guided by some theoretical framework.

The hardliners versus pragmatists and Republicans versus Democrats approach denies the essential unity within the foreign policy establishment over ultimate objectives in Central America. In fact, there was never really any breakdown of underlying consensus on the region. With perhaps a handful of exceptions, U.S. lawmakers from liberal Democrats to right-wing Republicans were united in the ultimate outcome they wished to see in Central America. Democrats opposed hardline Reagan policy not because they saw revolutionary change to be just or necessary, or because they viewed the United States as a historic force of oppression and domination over Central Americans. They opposed it because they saw such methods as sponsoring death squads, mining harbors, and trading arms for hostages as reckless and counterproductive to the ultimate goals of containing the revolutionary challenge, restabilizing a procapitalist, elite-based social order in the region, and reasserting U.S. control. These objectives were not in dispute. The debate centered on how to achieve them, an issue of tactics and strategy not of essence, no matter how heated that debate became. LeoGrande comes across at times as apologetic of—even embarrassed by-Democrats for their inability (unwillingness?) to oppose more fundamentally the hardline Republi-

The third flaw is that key pieces of the story are left untold. The chronicle is presented almost exclusively from the Washington perspective. LeoGrande admits as much: "The principal venue of this story is Washington, D.C." (p. x). But his explanation for this approach is not very satisfying. The view that, for good or ill, Central America's fate during this crisis depended fundamentally on decisions made in Washington denies the agency of Central Americans and reduces the dialectic of international dynamics and transnational social forces to a one-way street. Moreover, Guatemala is left out, as are Honduras and Costa Rica, the two political-military rearguards of the regional counterinsurgency/counterrevolution. One cannot expect everything from a single work, but a study of this magnitude (590 pages of text) could have substituted some of the more minute detail for a broader focus.

Perhaps the most significant part of the story entirely missing is the neoliberal restructuring of the Central American economy under Washington's tutelage. This was the economic counterpart to the U.S. political-military campaign. It facilitated the region's reintegration into global capitalism under a new model of accumulation. That reintegration weakened the old agro-export oligarchies, undermined revolutionary strategies, and strengthened modernizing technocratic groups, which contributed enormously to the political conditions for a negotiated outcome to the crisis that fit comfortably within the emergent global capitalist order.

State Interests and Public Spheres: The International Politics of Jordan's Identity. By Marc Lynch. New York: Columbia University Press, 1999. 327p. \$49.50 cloth, \$18.50 paper.

Rex Brynen, McGill University

Jordan is a relatively poor, weak country situated in a highly conflictual neighborhood. It has been very permeable to the shifting ideological winds of Arabism and has faced divisive questions of national identity and purpose (to the point of civil war in 1970–71). It also has, since the parliamentary elections of 1989, experienced both a substantial political opening and a subsequent restriction of public freedoms.

For all these reasons, Jordan is an excellent laboratory in which to assess the competing theoretical claims of realist/rationalist and constructivist approaches to the explanation of international relations. To what extent have Jordan's foreign policy interests and behavior derived from its struggle for survival in an anarchic region, shaped by patterns of regional threat, alliance, and resources? In what ways have changing regional norms and the shifting strands of Jordanian identity determined state interests? What role has been played in all this by the changing quality and nature of domestic political discourse?

In his excellent book, Marc Lynch takes on the task of evaluating competing explanations. He does so against the backdrop of four major shifts in modern Jordanian foreign policy: King Hussein's 1988 decision to disengage from the Israeli-occupied West Bank; Jordan's refusal to align with coalition forces against Iraq during the 1990-91 Gulf War; the decision, in 1994, to sign a peace treaty with Israel; and the reversal of Jordanian policy toward Iraq in 1995-96. These decisions, Lynch suggests, can only be partially, inadequately, and inconsistently explained by the dominant realist/rationalist approaches (threat balancing against external challenges; "omnibalancing" against a combination of external and domestic political factors; or rent-seeking in support of domestic neopatrimonialism). Constructivist approaches are seen by Lynch as having much to offer. These, however, ultimately fail to treat adequately the question of how and where identities, norms, and values ultimately emerge; of how precisely they undergo change; and in what ways they are linked to foreign policy behavior.

These gaps, Lynch suggests, are better dealt with from a public sphere approach, in which analytical attention is devoted not to the important role of norms and identity but also to the contexts and formats in which these values are contested, reshaped, and adopted. During the period covered by the book, both the Arab and Jordanian public spheres underwent dramatic changes. The Arabist core of the former was dealt a shattering blow by the Gulf War. The quality and importance of the domestic public sphere grew dramatically with Jordan's 1989 political liberalization, only to diminish somewhat with greater press restriction from 1994 onward. According to Lynch, "the shift in the location and efficacy of deliberation, between and within public spheres, powerfully affect[ed] Jordan's articulation of state interests and its strategic choices" (p. 70).

The bulk of the book buttresses these claims through detailed examination of the public debate (within the media, professional associations, parliament, and other fora) that preceded, accompanied, and followed each of the foreign policy decisions under examination. In each case, Lynch's examination is detailed, well written, and highly sensitive to the nuances of local politics. Indeed, although the book is

predominately aimed at debates within international relations theory, students of Jordan's domestic politics will find much of interest here.

Perhaps the weakest part of Lynch's analysis, not surprisingly, arises from an attempt to impute causal linkages between foreign policy behavior and public debate. In part, this is because the relationship often appears to be dialectical: Foreign policy decisions not only may reflect emerging consensus in the public sphere but also may be intended to shift public perceptions and attitudes (a point Lynch recognizes explicitly in the case of Jordan's 1988 disengagement from the West Bank). Moreover, in the absence of detailed process-tracing of particular decisions, it is difficult to know whether the private calculus of decision makers is accurately reflected by public discourse. Methodologically, greater use could have been made of interviews in an attempt to provide some of this. It may well be, however, that the semiclosed nature of Jordanian (especially royal) decision making and the relatively recent nature of events would have limited the effectiveness of such an approach.

Overall, this is a very valuable book. It is a major addition to the rich and growing literature on the complex interrelationships between domestic and foreign policy in the Middle East. Without overstating his contribution, Lynch also offers keen insight into the broader contributions of realist/rationalist and constructivist approaches to the study of international relations, the opportunities for theoretical synthesis, and the considerable value of an analytical division of labor between them. His articulation of the importance of the public sphere approach is clear and effective. In short, this work deserves to be widely read.

The Americas in Transition: The Contours of Regionalism. Edited by Gordon Mace and Louis Bélanger. Boulder, CO: Lynne Reinner, 1999. 195p. \$38.00.

Marjorie Woodford Bray, California State University, Los Angeles

Economic integration is the concept of regionalism emphasized by most of the authors in this book. They are largely Canadian (one is Brazilian), which flavors their perspective. In the first article, "Hemispheric Regionalism in Perspective," Mace and Bélanger define regionalism as "a multidimensional political process of integration occurring between two or more countries in a given geographical region." They do not expect it to lead usually to a new political unit but to greater cohesion and some "joint management" of common problems. They do not see it as automatic but the product of "human agency." Processes can be halted or interrupted when actors change. The interplay of actors' strategic behavior and the processes of regionalism are what the book purports to study (p. 1). The definition of actors is an inclusive one. There are chapters on the U.S. Congress, Brazil, middle states (Argentina, Mexico, and Canada), the Organization of American States (OAS), business, and social

The book begins with articles that define hemispheric regionalism and give the history and structure of inter-American relations. The definition of issues of regionalism that are important in addition to the economic dimension are security, the environment, and cultural values. The historical discussion concludes with the question of the fate of regionalism in the Americas since the Summit of the Americas held in Miami in 1994, which called for a timetable of integration into a hemispheric free trade area to be achieved by 2005. Mace notes that the "mood" of the actors has "fluctuated

wildly" since (p. 35). This point is particularly illustrated in the later chapter on the U.S. Congress by Bernard Lemelin.

The discussion of the structure of trade emphasizes, with statistical analysis, the dichotomy between the trade relations among those nations that trade largely with the United States and the cluster of the southern cone. The latter increased with the establishment of Mercosur (the common market set up by Brazil, Argentina, Uruguay, and Paraguay). Also stressed are the dominance of the United States economically in the region and the disparity in the levels of economic development and levels of income per capita. The article by Ivan Bernier and Martin Roy focuses on the difference in the structure and aims of Mercosur and the North American Free Trade Agreement (NAFTA) among the United States, Canada, and Mexico and the difficulty of combining them into Mercosur. The latter is a gradual process that "leaves room for backtracking" (p. 79), whereas the United States insisted that all elements be defined before NAFTA was

The authors of the article on the OAS (Guy Gosselin and Jean-Philippe Thérien) do not expect that organization to play a primary role in economic integration, although they believe its role in promoting democracy and human rights has increased. They cite the importance of the Canadian decision to participate in the organization and to create the Unit for the Promotion for Democracy (UPD), which by mid-1998 had observed 37 electoral processes. The authors note that the Inter-American Commission on Human Rights was allowed to observe the situation regarding human rights in Brazil in 1995 and Mexico in 1996. Also important was the OAS role with the United Nations in the peace process in Central America, especially Nicaragua, although in El Salvador and Haiti it was obliged "to yield the political leadership of peacekeeping operations to the United States" (p. 191). They conclude that because of limited resources the OAS cannot play a major role in trade and even human rights. The Miami summit was held outside the Organization of American States, which weakened its role in integration. They also point to the fact that some Latin Americans remain suspicious about linking democracy to trade liberalization, as promoted by the United States. "Simply put, the United States sees poverty as a domestic issue, whereas the OAS argues that it is a transnational problem" (p. 89).

The analysis of different business perspectives by Klaus Peter Fischer is especially interesting. He divides business interests into three groups: traditional exporters and merchants, new industrialists, and subsidiaries of multinational corporations (MNCs). He expands the second group to add a fourth category, the most successful of the new Latin American industrialists, which he calls Third World Multinationals (TWMs). He dissects these interests' differing attitudes toward regional integration. The traditional groups view integration with "benign tolerance" (p. 202). The new industrialists "traditionally adopted a stance of qualified opposition" toward integration (p. 203), but when it was inevitable, they wanted to be involved to protect their interests. The TWMs now promote integration. Fischer calls Mercosur the brainchild of Grupo Bunge and Bourne of Argentina (p. 205). He sees MNCs as allies of the traditional sector and supporters of integration. Also, he divides models of integration into three categories: secessionist-protectionist, integrationistprotectionist, and integrationist-competitive. The first two were competing with each other in the 1970s and 1980s; the third, which is represented by Mercosur, is now the "dominant" position. He concludes that although the United States has been the leader in promoting integration in Latin America since the late 1950s, the results have been alternative

models developed by Latin Americans in response to U.S. initiatives.

The chapter on social movements, "Regionalism from Below," is an extremely important and complex analysis. It cites cross-border efforts of resistance to integration, such as that which took place in relation to NAFTA. Also discussed is opposition to the Organization for Economic Co-operation and Development (OECD), the World Bank, and the International Monetary Fund (IMF) by nongovernmental organizations as an effort to create a "global civil society" (p. 224). The areas of cooperation lie in labor unions, women's groups, religious organizations, environmental interests, microbusinesses, teachers, health care workers, and others. These coalitions and networks play a double role in regional integration. They "transcend nationally bound politics," but they also attempt "to transform national and local sites of politics" (p. 235).

This book is a valuable contribution to the understanding of hemispheric integration. The only glaring lack is how the process affects smaller states, which are frequently the most poverty stricken. For example, the chapter on Mercosur makes no mention of the roles of Uruguay and Paraguay.

Deadly Transfers and the Global Playground: Transnational Security Threats in a Disorderly World. By Robert Mandel. Westport, CT: Praeger, 1999. 139p. \$55.00.

Chris McHorney, Southwest State University

Robert Mandel employs a descriptive and imaginative metaphor to explain the problem of covert transnational transfers. Like the typical neighborhood playground, the international system is an increasingly anarchic and dangerous environment. Due to an insufficient number of effective monitors, individuals and groups dissatisfied with the status quo can engage in illegal activities with little or no fear of punishment. The recent computer viruses that caused billions of dollars in damage and the global AIDS epidemic illustrate the devastating economic, political, and social consequences of the covert transnational transfers discussed in this book.

Mandel examines six covert transnational transfers (conventional arms, illegal immigrants, illicit drugs, hazardous materials, infectious diseases, and information disruptions). By selecting six "deadly transfers" that endanger national and international security, Mandel focuses on the strongest challenge posed to states by covert transnational flows. Each transfer threatens at least one of the three critical protection goals of every state: biological survival, political authority, and socioeconomic cohesion. In addition, the six transfers are highly interconnected. For example, individuals and groups involved in the sale of illicit drugs may also profit from the transportation of illegal immigrants. Policymakers must consider the interconnectedness of the deadly flows when attempting to develop an effective response.

Mandel identifies three different groups of actors on the global playground: unruly perpetrators, ineffective monitors, and not-always-innocent victims. He offers the reader a succinct explanation for the behavior of the perpetrators and ineffectiveness of the monitors. Frustrated with the status quo, the perpetuators resort to covert transactions to address perceived grievances. An anarchic and increasingly global system facilitates their self-interested behavior. Concerns over sovereignty limit the effectiveness of states, intergovernmental organizations, and nongovernmental organizations. The classification of multinational corporations as "largely involuntary" victims is the one questionable aspect of the classification system. They are portrayed as naive victims

stripped of "power, protection, or property" (p. 8) by the perpetuators, such as rogue states and terrorist groups. Multinational corporations involved in covert transactions, such as the illegal transfer of conventional arms and hazardous materials, are not involuntary victims.

Mandel identifies two different responses by the elite and masses to the problem of deadly transfers. One group denies that these represent a problem and adopts an optimistic perspective that is grounded in a faith in the stabilizing values found in capitalism and democracy. A second group, after acknowledging the severity of the problem, adopts a "fortress" mentality and responds to the threat with cynical renophobic self-protection behavior. Mandel ignores a third response: the attempt by states, intergovernmental organizations, and nongovernmental organizations to address the problem. For example, the Western democracies responded to the threat of nuclear proliferation by creating such regimes as the Missile Technology Control Regime and Wassenaar Arrangement on Export Controls to limit the transfer of necessary technology and materials.

Mandel offers several systemic and attitudinal explanations for the increasing frequency of covert transnational transfers. He argues that the structure of the post—Cold War international system "has been uniquely conducive to a mushrooming of these ominous transnational flows" (p. 25). More specifically, there were dramatic improvements in transportation and communication technology, a growing number of increasingly powerful nongovernmental organizations, and growing global interdependence during the first ten years after the Cold War. One can see the relationship between these trends and an increase in ominous deadly transfers. Yet, Mandel fails to explain adequately the link between the trends and the end of the Cold War. Why should the end of the Cold War have led to major scientific breakthroughs in our ability to communicate with one another?

According to Mandel, individual attitudes—such as the emphasis on freedom and individualism associated with democratization, an "escape-from-reality" syndrome, and greater emphasis on immediate material self-gratification—have also contributed to the growing frequency of transnational transfers. A society obsessed with escaping reality and pursuing immediate material self-gratification might be more susceptible to covert transfers. Yet, democratization should reduce the demand for such transfers by allowing individuals and groups dissatisfied with the status quo to address their grievances by working within the political process.

Mandel uses six short case studies to illustrate the severity of the problem. Each includes a discussion of the scope, recent history, and security implications of the transnational transfer. Given the covert nature of the transfers, Mandel does a commendable job of estimating the scope of the problem. Conventional weapon components and finished conventional weapon systems provide the best support for his argument. Weaker cases are illegal immigration and hazardous materials.

Comparing illegal migration with other covert transnational transfers, such as illicit drugs, seems inappropriate given the disparity in economic, political, and social costs between the two activities. Whereas the use of illicit drugs imposes heavy economic, political, and social costs and offers no known benefit to society, the effect of illegal immigration is much less certain. For example, countries may partially resolve a labor shortage by temporarily ignoring illegal immigration.

The inclusion of both toxic waste and military-grade uranium and plutonium in the hazardous materials case is a second problem. There are key differences between the two.

Toxic waste, which is an undesired by-product of the manufacturing process, typically provokes a "not-in-my-backyard" response, whereas potential proliferators seeking to develop nuclear weapons covet military-grade uranium and plutonium. Nuclear weapons represent a much greater threat to biological survival than toxic waste. Furthermore, the American government has not documented a single successful illegal transnational transfer of military-grade uranium or plutonium. The inclusion of a case study that considered the transfer of material and technology necessary for the production of weapons of mass destruction would have resolved this problem.

Whom should we blame for the deadly transfers? Mandel criticizes the industrialized democracies. They have implemented policies to halt the transactions that "exhibit considerable ambivalence, inconsistency, and downright hypocrisy" (p. 87). More specifically, the hypocritical response is the result of the gap between political rhetoric and public policy. The source of the gap is the tension between national security concerns and financial gain. The lack of a "uniform and universal rule-set that is consistently voiced and followed" (pp. 96–7) compounds the problem.

Mandel questions the efficacy of traditional approaches to limiting deadly transfers, such as coercive force, international law, legalization, international conferences, and reducing supply. He offers an unorthodox approach that hinges on reducing the perception gap between individual wants and societal costs, an attitudinal change that alters the incentives faced by individuals, groups, and states considering a covert transnational transaction. Potential perpetrators who understand that immediate self-gratification imposes costs on society and may even limit their individual benefits ought to be less likely to engage in illegal transactions.

In order to change attitudes, Mandel offers five policy suggestions: reduce the demand for the transfer; expose and humiliate the perpetuators; develop an integrated holistic response to all the transnational flows; facilitate public discussions about the consequences of the transfers; and encourage personal sacrifice to reduce transnational flows. These public policy options have two limitations. First, the author fails to provide real-world applications. For example, how might a government facilitate a discussion of the costs imposed on society by individuals interested in instant self-gratification? Second, Mandel overemphasizes the role played by most of society in the covert transfers. Most members of society simply do not participate in the illegal transactions described in the book.

Those interested in a thought-provoking analysis of covert transnational transfers should read this book. Mandel addresses a very complex and challenging problem in a manner that is certain to encourage discussion among scholars and policymakers.

Security, Identity, and Interests: A Sociology of International Relations. By Bill McSweeney. Cambridge: Cambridge University Press, 1999. 239p. \$54.95 cloth, \$19.95 paper.

Rodney Bruce Hall, University of Iowa

In this ambitious new book, Bill McSweeney applies a great deal of thought to questions at the heart of an ongoing project to retheorize international security studies and to metatheoretical issues at the heart of current debates in the international relations field. McSweeney powerfully critiques realist and objectivist approaches to international security studies, and he argues that security is "inextricably related to identity, and security policy to the reconstruction of collective

identity" (p. 12). But McSweeney conversely argues that, because the social reality within which security policy is formulated is socially constructed, an equal emphasis on the role of material interests is required to explain the rise and transformation of collective identity.

McSweeney maintains that two basic notions of "security" run through the history of security studies: the "common" or international security of all nations versus the "national" view that security is a property of the state. Both are convincingly critiqued. He groups the literature into four phases and analyzes each. The early "political theory" period was followed by a "political science" period, which featured the notion of "national" security. Then there was a neoliberal institutionalist "political economy" phase. The present "sociology" era is characterized by constructivist, postpositivist, and critical theoretic challenges to the objectivist, behavioralist, and the positivist theoretical commitments of earlier phases.

McSweeney is at his best when critiquing structural arguments that seek to explain behaviors "in terms of laws or causal generalizations... motivated by the need to rid the theorist of the messy complexity of human agency" (p. 38). He is also at his best in providing a very learned, thoughtful, and useful discussion of critical issues of agency and structure in social theory that articulates the reflexive sociologies of Anthony Giddens and Pierre Bourdieu and the ethnomethodology of Harold Garfinkle.

The book is not devoid of challengeable assertions, many of which stem from McSweeney's limited and tendentious reading of the constructivist literature and a similarly tendentious reading of the postpositivist literature in international relations theory. McSweeney takes on the work of Alexander Wendt on the constructivist side and David Campbell on the postpositivist side. They are exemplars, in his view, of how these bodies of scholarship fail to discover his key assertion that "[material] interests play a mutually constitutive role with identity" (p. 130). McSweeney cites few postpositivists, most notably James Der Derian, Martin Hollis, and Steve Smith.

On the constructivist side, the author cites few scholars aside from Wendt. There is a passing reference to Nicholas Onuf, and only one work of John Ruggie is mentioned briefly. McSweeney fails to cite a single, sole-authored work of the equally prolific and foundational constructivist scholarship of Friedrich Kratochwil. Throughout the book McSweeney writes as though in critiquing the work of Wendt he is thereby critiquing constructivism. He appears unaware of the diversity of theoretical perspectives in the first generation of constructivist thought, let alone the second generation. Many of the latter owe as many or more intellectual debts to Kratochwil, Onuf, and Ruggie, among others, as to Wendt, and their works explicitly or implicitly challenge the objectivism, positivism, and state-centrism with which McSweeney charges Wendt.

In short, treating the work of Wendt as representative of constructivism does not do justice to this diverse body of scholarship, which will likely limit the influence of Mc-Sweeney's argument. The author seems unaware that Wendt's Social Theory of International Politics (1999), in particular, is a subject of criticism among constructivist scholars on the ontological and/or epistemological "left" of Wendt (where McSweeney appears to reside). It is by no means yet clear that Wendt's variant will be embraced as the foundational text for the future development of constructivism. Yet, McSweeney employs his reading of Wendt to argue that "constructivism does not necessarily pose a challenge to the methodological principles and epistemological assump-

tions of the mainstream approach" (p. 203) to international relations. But Kratochwil and Ruggie, together and individually, as well as Onuf and others have challenged these principles and assumptions early and repeatedly. Significantly, Kratochwil recently criticized Wendt's book for treating social causality and material causality in analogous fashion. (Friedrich Kratochwil, "Constructing a New Orthodoxy? Wendt's 'Social Theory of International Politics' and the Constructivist Challenge," Millennium 29 [2000]: 73–101).

McSweeney's reading of Wendt is studded with challengeable assertions. He accuses Wendt's constructivism of "cultural determinism" for separating the concepts of agency and structure, placing them in opposition to one another, which fails to realize that while identities structure interests, interests conversely help to structure collective identities.

It is not clear that McSweeney has given Wendt's book a thorough read. In Wendt's chapter 5 (p. 231) it is specifically stated that actors may choose identities on the basis of interests, and the thrust of chapter 7 is consistent with this proposition. But Wendt's broader point is that any definition of interest, whether "material" or not, always logically presupposes the existence of some kind of identity. An actor cannot know what she wants until she knows who she is. Thus, when actors "choose identities on the basis of interests," they are choosing one identity on the basis of interests that are constituted by another identity that is more constitutive within a hierarchy of identities. I cannot see how a careful reading of Wendt's chapter 5 (pp. 224-33) can sustain McSweeney's assertion that Wendt treats identities and interests as rival propositions. Also, McSweeney does not offer a coherent account of "material interests" that does not presuppose some conception of identity, or make clear whether he believes we can detach material interests from identities altogether. He usually seems to assert that they may not be separated, but his treatment of the issue creates some confusion regarding his own position.

McSweeney attempts to illustrate the generation of new collective identities from material interests empirically with discussion of the identity consequences of European integration, the eastward expansion of NATO, and the 1998 Ulster Accord, but he does not explore alternative explanations in any systematic fashion. These empirical cases support McSweeney's assertions only if we accept his "seduction" model of integration, which could benefit from further theoretical as well as empirical development.

These caveats aside, I am in broad sympathy with Mc-Sweeney's call to develop a more explicitly reflexive sociological constructivism. I find much to praise in his efforts to broaden and retheorize the concept of security and in his assertion that the success of this project depends upon a reflexive understanding of the relationship between agencies and structures, as well as an appreciation of the moral choices involved in defining security. McSweeney provides an important contribution to these issues that deserves to be carefully read, with the caveat that his spare and tendentious reading of the constructivist literature leaves him with mistaken impressions of the status of the "predominantly American" (p. 203) scholarship he critiques.

Liberal Peace, Liberal War: American Politics and International Security. By John M. Owen IV. Ithaca, NY: Cornell University Press, 1997. 246p. \$45.00 cloth, \$17.95 paper.

Sean M. Lynn-Jones, Harvard University

Liberal Peace is a noteworthy and original addition to the small but growing number of books (as opposed to articles)

on the apparent absence of war between democratic states. Owen advances our theoretical understanding of how the liberal peace works and offers further empirical support for the democratic peace proposition. His central arguments are that the democratic peace is actually a liberal peace and that liberal ideas and institutions operate together to promote peace between liberal states. These arguments are supported by ten case studies of international crises involving the United States between 1794 and 1898. These crises include the 1796-98 quasi-war with France, the War of 1812, the Mexican-American War, Anglo-American crises during the U.S. Civil War, and the Spanish-American War. In each case, Owen examines whether the two states involved were liberal, whether they perceived one another as such, and how these perceptions influenced the course of the crisis. He finds that if states saw each other as liberal they avoided war and usually invoked shared liberalism as the basis for that choice.

The book makes three important contributions to the growing literature on whether and why liberal or democratic states do not war with one another. First, Owen offers a comprehensive and thoughtful explication of the logic that explains why such states are likely to remain at peace. He argues that liberal ideas matter, but they have influence on foreign policy only when strong liberal institutions exist. He thus rejects the dichotomy between normative and institutional explanations for the democratic peace and suggests that a synthesis is necessary.

Second, the book presents detailed case studies, which are essential complements to the quantitative work that has been prevalent in the literature. Owen rigorously and carefully employs qualitative research methods, engaging in processtracing to uncover the causal mechanisms that operated in each crisis. The result is not only an exemplary demonstration of the use of qualitative methods but also a convincing demonstration that liberal ideas and institutions actually cause liberal states to behave differently from other types. In many of the crises, liberals in the United States and other countries argued that one liberal state should not attack another. Some even wrote of "the peace between republican peoples" (p. 139). This pattern of behavior is also a useful reminder that the idea of a democratic peace exerted practical influence on diplomacy in the almost two centuries between its initial articulation by Kant and its rediscovery by political scientists.

Third, the book stands out among recent studies because Owen does "not support the notion that there has never been a war between liberal states" (p. 6). He also argues that perpetual peace would not emerge in a world of liberal states, because illiberal states serve as the "other" against which liberal states define themselves.

Owen's argument for the general tendency of liberal states to remain at peace with one another may be more defensible than claims that the democratic peace proposition is an "iron law," but neither proponents of the proposition nor their realist critics are likely to be satisfied with it. The former will argue that Owen has failed to identify any clear-cut cases in which liberal or democratic states fought one another. They would not regard the cases that he lists as candidates (the War of 1812, the U.S. Civil War, and the Spanish-American War) as international wars between liberal states. Realists will suggest that Owen exaggerates the strength of the liberal peace. They will point out that realist explanations account for the outcomes in some of Owen's cases. For example, Owen concludes that Chile's awareness of "superior U.S. power" (p. 158) motivated it to accept U.S. demands in the 1891-92 crisis over the treatment of the crew of the U.S.S. Baltimore in Santiago. Realists will also argue that power politics, not liberal values, can explain the results of other crises Owen analyzes (Christopher Layne, "Kant or Cant: The Myth of the Democratic Peace," *International Security* 19 [Fall 1994]: 5–49).

Despite its strengths, Liberal Peace has two important weaknesses. The first is that Owen risks undermining much of his argument by recognizing that liberal states sometimes fail to perceive one another as such. Realists will claim that this vitiates the peace proposition, because perceptions are malleable and are often influenced by levels of threat, a variable central to realism. Several of Owen's cases (e.g., Mexican perceptions of the United States in 1845-46, Chilean perceptions of the United States in 1891-92) indicate that liberals may perceive a liberal state as illiberal when it threatens the territorial integrity of their own state. To his credit, Owen recognizes that threats can determine whether a liberal state regards another as liberal. He finds that realist theories best explain some cases, including how Mexico in 1845-46 and Chile in 1891-92 perceived the United States. He argues, however, that in the majority of cases the most important influence on perceptions is whether liberals have a positive view of the domestic regime of another state: Liberals in state A will perceive state B as liberal when it adopts the domestic institutions favored by liberals in state A. Despite Owen's valiant and sophisticated attempts to address this criticism, realists are unlikely to be persuaded. They will point out that realist theories are likely to operate in the most threatening crises—precisely the type of case in which Owen admits that threats or other realist variables shape perceptions of whether states are liberal.

A second important weakness is that Owen selects only cases involving the United States, and all the crises examined occurred before 1900. It would be unreasonable to expect a single author to conduct detailed case studies of crises involving all liberal states, but the limited focus raises questions about whether the conclusions apply generally. Significantly, in the crises that Owen examines liberal ideas seem to have less influence on foreign policy in countries other than the United States (e.g., Mexico, Chile, and Spain). The book's argument would be strengthened if it were confirmed by additional systematic case studies of a variety of liberal and democratic states in the twentieth century. Owen acknowledges this criticism (pp. 62-3) but does not offer an entirely satisfactory response. He might have pointed out, for example, that many criticisms of the democratic peace proposition claim that it relies excessively on data after 1945 and that his focus on an earlier period helps answer these critiques.

Several trivial blemishes mar the book. The case studies sometimes offer only minimal discussions of the background and context. No book can be a complete history of U.S. diplomacy in the nineteenth century, but many readers will not be familiar with the details of U.S.-Mexican diplomacy before the Mexican-American War or the Virginius Affair. In the absence of sufficient explanations of the historical context, Owen's discussions of each crisis often become somewhat mechanistic enumerations of quotations.

The final chapter, "Implications and Conclusions," is another weak point. It is tempting to apply the book's analysis to contemporary world politics, but this chapter does not execute the task particularly well. The selection of the India-Pakistan and Japan-Korea dyads for analysis seems arbitrary. The discussion of how liberalism has influenced relations between these countries is much more superficial than the analysis of the cases involving the United States.

These shortcomings notwithstanding, Liberal Peace is an impressive achievement and a significant addition to the

literature. Proponents and critics of the democratic peace proposition alike will have to take into account its sophisticated and nuanced explanation. Scholars who use case study methods will find the book a useful model. Owen's work provides strong evidence that liberalism exerts significant influence on the crisis behavior of liberal states. It should stimulate further research on the influence of liberal ideas and institutions on foreign policy more generally.

Civil Wars and Foreign Powers: Outside Intervention in Intrastate Conflict. By Patrick M. Regan. Ann Arbor: University of Michigan Press, 2000. 172p. \$39.50.

Roy Licklider, Rutgers University, New Brunswick

Patrick Regan focuses on two important questions: When do states intervene in civil wars, and under what conditions is this intervention likely to end the violence? The book is an admirable attempt to use serious social science analysis to respond to the concerns of policymakers, who are without much basic information in this new and challenging arena.

The analysis is based largely on logit analysis of 138 intrastate conflicts from 1944 to 1994. (The number is somewhat larger than in other studies because Regan drops the minimum number of casualties from 1,000 to 200.) In 89 of these cases there was at least one unilateral intervention; in all, there were 194 such interventions. (Multilateral interventions are evaluated separately.) He judges that only about 30% helped stop the fighting.

Regan found that states were more likely to intervene during the Cold War than afterward, when conflicts were less intense, and when there was a humanitarian crisis. Interestingly, intervention was less likely in states with many shared borders rather than few, I wonder if dropping out less powerful neighbors would have made a difference. Success, defined as stopping the fighting, was more likely when interventions were undertaken by major powers, involved a mixture of economic and military techniques, supported the ruling group, and were directed at wars with relatively few casualties. I was surprised by the conclusion that intervention in intense conflicts, when it occurs, is much more likely to be successful than in less intense ones. Perhaps governments only become involved in such conflicts when they feel conflictent of success.

In general, this analysis is very well done. Regan does a good job of explaining what he is doing, although he involuntarily illustrates the tension between social science and policymaking by making the book harder to read. He is particularly good about noting the variables omitted from analysis (pp. 24-6) and on the whole issue of selection bias (p. 144 ff.). Separate analysis of high-casualty cases is a good idea and yields interesting conclusions: "Cultural" conflicts differ from ideological ones only in these cases, and for these cases success is more likely in religious wars than ideological ones, with ethnic conflicts in the middle but leaning toward the ideological end (p. 91).

Regan has a chapter on multilateral interventions, which have become much more common in the past decade. The analysis is based on comparative case studies rather than quantitative data and is somewhat less persuasive than the primary analysis. He argues that multilateral interventions have different functions from unilateral interventions; they focus less on ending violence and more on reducing the likelihood of renewed violence after the parties have reached a settlement (what is often called peacekeeping and peace-

building). Therefore, he concludes that success is more likely when the intervention is neutral, has the consent of all parties, and involves a clear and appropriate strategy.

Of course, intervention is something of a moving target, as Regan notes. At least for the United States, unilateral intervention seems a less likely policy option today than during the Cold War. At the same time, we face the problem of what to do when one or both sides will not or cannot reach agreement while creating a situation that the international community (whatever that means) is unwilling to tolerate. Thus, we have a second generation of multilateral intervention, sometimes called peacemaking, in which military force is used to end the violence, even though this means taking sides in the conflict, before peacebuilding is applied; Bosnia, Kosovo, and Sierra Leone are current examples. Moreover, as William Zartman has pointed out, governments without interests in particular conflicts are unlikely to commit significant resources to their resolution, but such interests mean that they will not be neutral. This insight remains important even in multilateral interventions, where individual governments still have to decide whether and how to contribute. Thus, Regan's distinctions may not apply in some of the more interesting and urgent cases.

On balance, this is an important study of a major issue for both policy and theoretical reasons. Its utility is somewhat limited because the data end in 1994 and because the focus is on unilateral rather than multilateral interventions. Moreover, despite Regan's explicit desire to speak to policymakers, the book is rather heavy going for them or for undergraduates. Nonetheless, future researchers will have to take this book and its conclusions into consideration.

The Netherlands: Negotiating Sovereignty in an Interdependent World. By Thomas R. Rochon. Boulder, CO: Westview, 1999. 318p. \$65.00.

Steven B. Wolinetz, Memorial University of Newfoundland

This is a broadly gauged treatment aimed at general and specialized readers. Rochon begins with struggles against the sea and guides the reader through history, social structure, the welfare state, and foreign policy. En route, he highlights accommodation and Dutch efforts to maintain sovereignty. Rochon links the two: Forging consensus enables the Dutch to preserve autonomy.

Rochon starts with water management and the Dutch Republic. Chapters 3 and 4 examine segmentation along religious or ideological lines, its demise, and changes in voting behavior and parties. Chapters 5 and 6 treat institutions and policy processes, particularly deep-seated habits of accommodation. Early pluralism promoted tolerance. Pillarization in the late nineteenth and early twentieth century resulted in a politics of elite accommodation. Postmaterialism undermined this. The Dutch now use different rules of the game to accommodate old and new groups under "pluralist corporatism." Rochon then examines the development, enhancement, and retrenchment of the welfare state. Chapter 8 considers trade and the bases of neutrality before World War II and multilateral engagement since then. The conclusion relates consensus to Dutch success in international politics: Consensus is achieved by following rules of the game modified to cope with changing realities. Successful practices include accepting inaction when there is no solution, consulting widely, and recruiting leaders who can find solutions. Consensus allows the Dutch to adapt to their environment and resist demands from larger countries while exercising a modicum of influence in international affairs.

This is a book I was prepared to recommend and in some respects still can. It is well written. Anecdotes and literary references make it accessible. There is a wealth of information, although not all of it is accurate. On occasion, Rochon jumps to conclusions that are not always warranted or fully substantiated.

Errata include the terms of a 1954 Roman Catholic edict, the cabinet in which a key minister served, how Socialist leader Joop den Uyl rose to prominence, the proper name of an institution, and the sequencing of events. Specifically, the *Mandement* did not forbid voting for the Labour Party (p. 178) but suggested as much by banning membership in socialist unions. Lubbers was Minister of Economic Affairs under den Uyl, not van Agt (p. 181). Den Uyl did not become leader because he could placate the New Left (p. 179)—this happened later—but because of a long career in party and public positions. The formal name of the SER is the Social and Economic Council (Sociaal-Economische Raad) rather than Socio-Economische Raad; its size, until recently, was not 30 but 45 (p. 170).

These errors do not change the argument, but others do. Rochon claims that "maintenance of peaceful relations between the pillars" reflected "shifting coalitions between them" and goes on to argue: "Catholic leaders supported the Liberals for several decades in the 19th century...but as emancipation was achieved ... [they] ... forged an alliance with Protestant leaders on ... public support for denominational schools" (p. 39). This is correct only if it refers to formal legal emancipation. Social emancipation had barely begun when the first confessional cabinet assumed office in 1888. Thereafter, confessional cabinets alternated with liberal cabinets until proportional representation (PR) was introduced in 1918. The confessionals governed through the interwar period, reinforced with smaller liberal groups after 1933. There is no evidence of shifting coalitions in periods when peaceful relations among the pillars should have been most at risk.

Rochon's views of social democracy and post-World War II rapprochement are difficult to accept. The author claims that the construction of the socialist pillar was a response to confessional mobilization (p. 32). Yet, socialist efforts to delineate a pillar paralleled Catholic mobilization, and socialist organization resembled not only that of the Calvinist and Catholic pillars (p. 32) but also that of kindred parties in neighboring countries. Rapprochement between Social Democrats and the confessional parties during World War II was at least as important as between Catholics and Protestants (pp. 162-3, 194-7 ff). Social Democrats had been excluded before 1939. Cabinets dominated by Social Democrats and Catholics built the postwar welfare state. Nearly equal in strength, the two parties wrestled about its shape. Impetus toward corporatism came not only from Catholics but also from Social Democrats, who saw corporatism as a way to combine planning and democracy. Protestants became involved later in the debate. Also, postwar labor peace cannot be attributed to confessional unionism (p. 163). The largest federation, the socialist NVV (Netherlands Federation of Trade Unions), was anxious to exchange industrial action for political influence.

Misinterpretations sometimes result from the juxtaposition of facts or events. The 1937 law that allowed extension of collective agreements to entire sectors was not a device to combat unemployment (p. 195) but to prevent employers from undercutting one another. Trade unions were not weakened by declining membership after the 1950s (p. 169); the decline did not occur until the 1980s. The Foundation Labour has not lost influence (pp. 169–70);

renewed social partnership in the 1980s and especially the 1990s restored its prominence. The Social and Economic Council also remains important. Just because governments are no longer required to consult it (pp. 171–2) does not mean that they do not.

Rochon argues that the Netherlands is a consensus democracy, characterized by extensive accommodation, but he says little about what is being accommodated. Following Lijphart, Rochon assumes that pillarization could have brought the Netherlands to the brink of war (pp. 3-4, 37). Yet, he presents no evidence that mobilization by leaders of competing religions, demanding separate schools, moral rectitude, and, in the case of Calvinists, Sunday rest, was likely to do so. Also, there is no reference to the subsequent debate on pillarization. Similar problems exist with assertions about changing rules of the game. These are mentioned, but little is said about how they operate.

Characterizing the Netherlands as an instance of "pluralistic corporatism" is questionable. The last thing corporatism needs is another modifier, let alone one implying its opposite. Rochon uses corporatism to mean giving groups a right to be heard. He argues that more and more groups enjoy rights to be consulted via advisory boards. This is true despite occasional efforts to eliminate them. The system is more fragmented than before, but its diversity is better captured by the notion of separate policy networks, common in the comparative literature.

One of Rochon's aims was to demonstrate Dutch pragmatism and flexibility. This he does, but perhaps not as successfully as he intended.

Cuba: Confronting the U.S. Embargo. By Peter Schwab. New York: St. Martin's Griffin, 1999. 226p. \$29.95 paper.

William M. LeoGrande, American University

Peter Schwab is outraged by the harm done to the living standards of ordinary Cubans by the U.S. economic embargo, which he calls "a brutal and vicious campaign" intended to starve them into submission (pp. 55, 101). He often lets his justifiable anger get in the way of his analysis, which leads to exaggeration and, too frequently, factual missteps. This book examines the terrible economic crisis that Cuba suffered during the 1990s after the collapse of the Soviet Union, especially the severe shortages of food and medical supplies, and the political consequences of this economic crisis.

Schwab's approach exemplifies the danger of focusing too intently on one aspect of social reality. He attributes all of Cuba's problems to the U.S. embargo. The general macroeconomic crisis of the 1990s, the decay of the health care system, the shortages of food, gasoline, and soap—literally every economic difficulty Cuba has faced in the past decade is ascribed to U.S. policy. Washington has kept Cuba "in a state of economic contraction and depression since at least 1991" (p. 168). Schwab even blames Castro's reconciliation with the Catholic Church—his "capitulation to Catholicism" (p. 119)—on the embargo, implausible as that sounds.

There is no doubt that U.S. economic sanctions have hobbled the Cuban economy, especially over the past decade, as Washington has slowed Cuba's reintegration into world trade and capital markets. In the area of health care, the effect has been most dramatic because so many drugs carry U.S. patents, and their export to Cuba is restricted. But no analyst of the Cuban economy, whether based in the United States, Europe, or Cuba itself, thinks that the main cause of the economic crisis has been the U.S. embargo.

The proximate cause was the collapse of the Soviet Union,

which deprived Cuba of about \$4 billion in annual economic assistance. Without that aid, the capacity to import shrank by about 75%. The economy went into a tailspin, losing 35–50% of GDP between 1989 and 1993 (but not 60% in a single year, as Schwab asserts on p. 71). To keep domestic production going as best it could, Cuba used scarce foreign exchange to import fuel and raw materials. There simply was no money for consumer goods, even such basics as food and medicine. The Cubans were not prevented from buying necessities by the U.S. embargo; Europe would have sold them most of these goods if they could have paid for them (albeit at higher cost).

The structural cause of the crusis lies in Cuba's failure to diversify the economy away from sugar because of its role in the "socialist division of labor." When the socialist bloc disappeared, Cuba was left with an inefficient industry producing for a world sugar market characterized by a long-term decline in prices. The solution has been a major shift into tourism, which now surpasses sugar as producer of hard currency.

The U.S. embargo has certainly impeded Cuba's ability to adjust. The U.S. travel ban limits the potential of the Cuban tourist industry; U.S. trade prohibitions raise the shipping costs to Cuba of buying and selling bulk commodities; and U.S. threats of litigation have probably limited the flow of foreign direct investment to the island. But the embargo is a hindrance, not the cause of Cuba's problems. By blaming the embargo for everything, Schwab misses the most interesting issue facing contemporary Cuba. Can a small country that is dependent on the international market (and therefore must organize its economy "efficiently" by market standards) maintain the sort of social and economic egalitarianism that has been a hallmark of the Cuban revolution?

Schwab clearly admires the Cuban government's efforts to provide for basic social and economic needs, and he agrees with the notion that these are fundamental human rights at least on a par with political rights and liberties. He takes a less defensible step, however, when he counterposes socioeconomic rights to political ones, arguing that there is a necessary tradeoff between them.

Elsewhere, Schwab has written critically of "Western" notions of human rights that give priority to political liberty at the expense of socioeconomic conditions. Here, he argues that the Universal Declaration of Human Rights is essentially an expression of Western cultural chauvinism "imposed" on the Third World (p. 6). He quotes approvingly the Cuban government's argument that the exercise of individual rights must be subordinated to the common good and can be legitimately restricted when "their use would lead to the erosion of the goals of the revolution" (p. 8). Left unanswered is the question of who defines the common good and by what authority. The goals of the revolution have gone through many twists and turns in the forty years since Castro's barbudos (bearded ones) rode triumphantly into Havana. How long can a government continue to claim a mandate to rule based upon a political uprising that occurred before most Cubans alive today were born?

Even more troubling is Schwab's insistence that socioeconomic rights and political rights are inherently in conflict. "If economic and social rights are primary within the context of what is good for the group as a whole... then individual political and civil rights, which conflict with the paramountey of the larger group, must be denied" (p. 113). He makes no analytic case for this, other than to insist that since Western notions of political liberty emerged from the development of capitalist society, they had to be abandoned when Cuba rejected capitalism (pp. 59-60). By this facile logic, socialist

democracy is an oxymoron; socialism requires authoritarianism. If we have learned anything from the failed socialist experiments of the twentieth century, we ought to have learned that without real democratic accountability, governments—even those that begin with the best intentions—end up serving their own interests rather than the public's.

Descending from the theoretical to the practical, Schwab argues that the Cuban government's intolerance of dissent is due largely to a siege mentality instilled by forty years of conflict with the United States. Castro sees in every dissident a plot by Washington to overthrow the revolution. Governments seeking an excuse to repress their opponents always look for a foreign enemy to blame, but never has a government had such a perfect foil as Washington provides for Fidel Castro. Over the years, the United States has invaded Cuba, conducted paramilitary sabotage, tried to assassinate Castro, and, of course, maintained an economic embargo with the explicit purpose of bringing down the government. Cuban dissidents themselves report that when U.S.-Cuban relations relax a bit, they enjoy more political space, and when relations sour, they suffer.

Schwab acknowledges that not every Cuban dissident is an agent of the CIA, and he argues that the Cuban government ought to allow greater political freedom, a recommendation that reveals he is not entirely convinced by his own argument that socialism and democracy are incompatible. Still, the chapter entitled "Political Dissent" focuses more on the machinations of Washington and the Cuban exile community than it does on dissidents in Cuba. It demonstrates why Castro feels threatened, but it does not explore the current intellectual ferment in Cuba as its well-educated population grapples with how to modify the socialist model in order to survive in a capitalist world.

Schwab concludes with speculations about Cuban politics after Fidel, which are entertaining but, like all such ruminations, should not be taken too seriously. What happens after Fidel depends on how and when he departs, neither of which is predictable. Schwab expects a smooth transition to a government that will remain socialist. "Fidel Castro's political visage will always be retained and will morally disallow the United States from attaining the dominant and oppressive role it held... prior to the revolution" (p. 186). Whether this wishful thinking will hold up despite the power of international markets remains to be seen.

Ironically, as Cuba rejoins the global system, the embargo is the one thing that prevents the mammoth U.S. economy from engulfing Cuba, as it did before 1959. Without the embargo, trade with the United States would quickly dwarf trade with every other partner, investment from U.S. firms (including Cuban-American firms) would dwarf investments from elsewhere, and tourists from the United States would dwarf the numbers from Canada and Western Europe. Today, the principal threat to national sovereignty and social welfare is not the U.S. embargo but Cuba's subordination to the rigors of international markets; not the political whims of Washington, but the impersonal demands of global capitalism.

Violent Cartographies: Mapping Cultures of War. By Michael J. Shapiro. Minneapolis: University of Minnesota Press, 1997. 241p. \$49.95 cloth, \$19.95 paper.

Ronen Palan, University of Sussex

The title of this book does not prepare the reader for the scope and ambition of the project. Far from being a rehashed version of the familiar if fashionable concern with conceptual, analytical, and discursive boundaries, it lays the groundwork for an alternative, ethnographic approach to security studies.

Shapiro's premise is that there can be two approaches to security studies. The conventional one takes its cue from Clausewitz and views the use of violence as a purposeful instrument of state policy. This approach has largely lodged within what is called a realist theory of power and state action. Shapiro advances an alternative ethnographic or "ontological" approach, however, which seeks "to attenuate identity commitments by reflecting on the boundary practices and history-making narratives by which they are shaped" (p. 138).

Drawing on Hegelian-Freudian-Lacanian theories of subjectivity, Shapiro argues that violence and the use of force are instruments of identity construction. According to these theories, self and identity, whether in the construction of the ego or the construction of the superego of the social collectivity, are an interactive social process. Interestingly, and correctly in my view, Shapiro does not identify with the fashionable symbolic interactionist theories of the self; rather, he delves deeper into the complex but rewarding world of Lacanian theory and is able to advance a dynamic theory of encounter.

The process is violent, or can be, to the extent that the construction of the other as a threat is always a construction of a binary opposition between two equally constructed "selfs." The violence that accompanies a particular representation of the other, therefore, has meanings that go much deeper than security studies acknowledges. Violence is lodged within an expression of an economy of representation. The cartography of modern violence tells us something very important about the broader relationships between the use of violence and collective and individual identities. It renders political economy as a cartographic pursuit: defining social bodies and boundaries and assigning meaning to these bodies as enemies, foes, and friends.

In that sense, security studies is not a separate field of investigation. On the contrary, Shapiro sees an important link between the naturalizing perception of territory that is presented as given in conventional discourse, "the commercial instinct," and the specific modes of modern violence. In the final analysis, a holistic political economy emerges that brings together theories of capitalism, modes of war, and collective identities. This theoretical framework allows Shapiro to narrate a history of modern violence in a novel way. The manner and technologies of constructing self and other (and the other way around) undergo change. The digitalization or derealization of the enemy, mediated through modern technologies, has wider and deeper effects on the construction of national or collective identities. There is no implicit or explicit causality. Shapiro does not argue that the digitalization of war causes the dispersion of modern identities, but within that it is part and parcel of it.

All this is good, interesting, and certainly worth dwelling upon, but it is not entirely novel. Shapiro's true contribution perhaps lies elsewhere. Rather than insist on the gap dividing the two traditions of security studies, Shapiro shows convincingly that the ontological tradition has always existed, underpinned and informed although unrecognized by the first. This is a shrewd move. To begin with, it allows Shapiro to advance a "proper reading" of Clausewitz as an important contributor to the ethnographic tradition. For Clausewitz, war is an instrument of state policy, no doubt, but it is viewed as an instrument of the state, itself attributed the trappings of a personality and individuality. So war and violence are forms of engagement in which the collective self defines its histor-

ical purpose. Hegel was very explicit about this aspect of war making, but by insisting on the pervasive nature of the ethnographic theme, Shapiro is able to subvert not only the founding fathers of strategic security studies but also, and more important, their contemporary sons and daughters. Under close scrutiny, the role played by, say, General Schwartzkopf during and after the Gulf War and analysis of some "conventional" if enthusiastic supporters of U.S. policy reveal clearly ethnographic concerns with symbolic action and collective identity. In Shapiro's skillful hands, the very thing that conventional security studies tries to forget comes back to haunt it.

Yet, the book fails in its final and most ambitious if unstated aim. All maps are constructed, attaching meaning to places and boundaries in a particular manner. Conventional geopolitical maps are replaced by a different cartography that maps out a constructed violent space. But why these particular violent cartographies of the late twentieth century? An outline is sketched out here, a few notes are added, but ultimately the picture remains fuzzy and uncertain.

Some readers may take exception to the style and structure of this book. In the current climate of "scientific" approaches to political science, Shapiro's collage of readings, his discursive if accessible style, and his eclectic yet rigorous use of diverse literature do not intimate to the reader either the true purpose of his project or the limitation of his undertaking. But then the discursive style gets the better of him, and the book is rather repetitive toward the end. Bearing in mind these shortcomings, Violent Cartographies is a fascinating, beautifully written, and unquestionably important contribution.

Mortal Friends, Best Enemies: German-Russian Cooperation after the Cold War. By Celeste A. Wallander. Ithaca, NY: Cornell University Press, 1999. 229p. \$49.95 cloth, \$19.95 paper.

Jeffrey T. Checkel, ARENA/Universitetet i Oslo

Celeste Wallander has written an excellent book, one that will appeal to Europeanists, post-Soviet scholars, and especially theorists of international relations (IR). The empirical core of the volume is a careful reconstruction of German-Russian security relations in the immediate post—Cold War period (1991–96). Wallander's data include Russian and German primary source material, patterns of actual behavior, and, perhaps most important, more than 140 interviews with policymakers, analysts, and academics in the two countries. Theoretically, she develops an institutional argument that goes beyond saying "institutions mattered." Instead, Wallander theorizes (and then empirically documents) the specific ways and conditions under which international institutions did—and did not—affect Russian-German relations.

The theoretical argument is developed in the first two chapters, through an approach clearly within the neoliberal institutionalist tradition of Keohane and others. These scholars argue that international institutions provide information and reduce uncertainty; at the state level, they constrain the strategies of self-interested actors. Wallander's important contribution is to add nuance and specificity to this spare theoretical frame. In particular, her "stronger institutional theory of security relations" (p. 28) explores how variation in institutional form and function and the "layering" of international institutions affect the likelihood of states choosing cooperative security strategies (pp. 27–40). The book's rigorous design then tests these institutionalist, as well as

alternative realist, hypotheses over a number of different cases in Russian-German relations of the 1990s.

After documenting that German and Russian policymakers shared some common interests and recognized that the use of force would be costly (the preconditions for the author's theory to be operative), Wallander explores the role of international institutions in shaping relations between these two great European powers in several areas. These include the withdrawal of Russian troops from unified Germany, multilateral conventional force reductions (the Conventional Forces in Europe, or CFE, Treaty), "out-of-area" missions for German forces, regional conflicts (Yugoslavia and within the former Soviet Union), weapons proliferation, reactor safety, and Russian economic reform (chaps. 4-7). The author's extensive interview material gives these cases a sense of "history in the making" that is so often missing from institutionalist accounts, which focus on the reduction of transaction costs and the like.

More important, the analysis is not of the either/or type, which gives all the causal weight either to power (realism) or institutions (institutionalism). Instead, Wallander offers a careful both/and argument, in which power and interests are refracted through and, in some cases, shaped by institutions. In this regard, the book is a model of social science research, exploring both instances in which institutions are causally important (Russian troop withdrawals from German territory, implementation of the CFE treaty) and cases in which their influence was marginal (conflict resolution and prevention in the former Yugoslavia) or nonexistent (nuclear reactor safety). Wallander thus uses the analysis to elaborate scope conditions for when and how international institutions matter (see, especially, chap. 8). This style of nuanced argumentation and empirically informed competitive hypothesis testing marks a welcome relief from the often vacuous and abstract tone of much of the neoliberal, neorealist debate.

Somewhat paradoxically, the book's rigid adherence to a positivist framework is perhaps also its greatest limitation. When Wallander uncovers evidence that does not fit within the neat causal arrows of the institutions state strategy relation, it is either set aside or left underused. Consider two examples. First, the author provides ample documentation that international institutions have not just influenced German strategies but, at a much deeper level, helped construct its very interests and preferences. Over and over, Wallander's interviews with high-level German policymakers and analysts show them to be almost reflexively institutionalist. They find it exceedingly hard to conceive or define German interests outside the dense institutional network within which their country is embedded. Unfortunately, except for a brief mention in the concluding chapter (pp. 204-6), the author fails to exploit fully such findings. This is a pity, for it could contribute to debates among Europeanists on the so-called Europeanization and internationalization of German national identity over the past 50 years.

Second, Wallander portrays European and other international institutions as passive actors, as a resource to be exploited by self-interested states. They have no sense of agency in their own right. Throughout the book, however, institutions often play a very active and social role, serving as forums for political dialogue (p. 106), as settings in which learning (pp. 129–30) and education (p. 190) occur, or as arenas in which states are socialized into the ways of the international community (pp. 161–3). Put differently, the author has uncovered evidence of institutions' constitutive power, a subject of heated debated among constructivists and other IR theorists. To probe these constitutive dynamics,

however, she would need to relax her epistemological stance, whose strict causal underpinnings force her to hold something constant—state interests here. This blinds Wallander to the possibility that institutions may also transform those very interests.

Yet, to make such criticisms is further testimony to the quality of this book. At the end of the day, Wallander's approach is problem and not method driven: She honestly reports results even if they do not fit neatly within her epistemological and theoretical frameworks. Indeed, both my criticisms and the author's own comments in the concluding chapter (pp. 204–11) suggest that the way ahead for institutional research on international relations is to escape the narrow confines of the "neo-neo" debate. The issue is no longer whether institutions matter (we know they do) but how they have effects. Do they constrain state strategies or constitute core state properties? Wallander's book should be a model for both rationalists and constructivists as they debate these issues in the years ahead.

Social Theory of International Politics. By Alexander Wendt. Cambridge: Cambridge University Press, 1999. 429p. \$59.95 cloth, \$24.95 paper.

David Dessler, College of William and Mary

Alexander Wendt offers a sustained philosophical reflection on the study of world politics. By "social theory" he means not substantive theory but philosophy of social science (p. 5). His subject is "the ontology of international life" (p. 370), and his main purpose is to open a space for constructivism in the study of international relations (IR). Constructivism's foils are materialism and individualism. Whereas materialists believe that "material forces as such—what might be called brute' material forces—drive social forms," constructivists claim that "material forces are secondary, significant insofar as they are constituted with particular meanings for actors" (p. 24). Individualists (most prominently, rational choice theorists) believe that social actors preexist social structures, but constructivists argue that structures constitute agents (p. 26).

Wendt assigns to constructivism the task of building "constitutive theory" and explaining "constitutive effects" in IR. Constitutive theory differs from causal theory, he argues. The latter asks "why" and shows how "a temporally prior X produced an independently existing Y." Constitutive theory asks "what" and reveals "the structures that constitute X or Y in the first place" (p. 83). "The distinctively constructivist hypotheses about the role of ideas and social structure in world politics are primarily about [their] constitutive effects" (p. 78).

Wendt brings to Social Theory of International Politics an immense learning, an instinct for asking big questions, and a careful eye for the nuance of important debates. He advances arguments across several levels of analysis, ranging from the philosophy of science as a whole to the philosophy of social science to the philosophy of international relations theory, and he draws on many disciplines, including political science, social psychology, sociology, and philosophy. Wendt's writing is sometimes difficult but invariably elegant. This is a very impressive work.

Three problems in the book concern the analysis of theory and explanation. First, Wendt classifies some IR theories, including neorealism, as materialist. (This classification is important because he relies on it to argue that constructivist IR is distinctive in not being materialist.) "What makes a theory materialist" is that it explains phenomena "by refer-

ence to 'brute' material forces—things which exist and have certain powers independent of ideas" (p. 94). Neorealism counts as a materialist theory because it identifies regularities linking the international distribution of power to state behavior (pp. 97, 102–3). Wendt believes that neorealists thus attribute to matter powers that no mere physical objects can have. "Neorealism 'fetishizes' material capabilities in the sense that it imbues them with meanings and powers that 'can only be correctly attributed to human beings'" (p. 109).

This argument falls to distinguish laws from theory. Neorealism's laws (statements of regularity, e.g., "bipolar systems are stable") might be termed "materialist" in the sense that they suggest we can predict aspects of state behavior by counting up material things. But neorealist theory (the framework that explains these laws) holds that the distribution of power makes state behavior predictable only because decision makers grasp it as meaningful in predictable ways. "The theory is built up from the assumed motivations of states," writes Kenneth Waltz (Theory of International Politics, 1979, p. 118). It might be true that neorealism does not give an adequate account of these motivations, which is a recurring theme in constructivist scholarship, but it does acknowledge their explanatory force. Neorealists do not "fetishize," or attribute human capacities to, material capabilities. "Structures do not act as agents and agencies do," explains Waltz (Theory, p. 74). Neorealists agree that "it is only because of their interaction with ideas that material forces have the effects that they do" (p. 112), a belief that Wendt identifies as the essential commitment of nonmaterialist IR theory. Perhaps some will want to argue, despite these points, that constructivism is still somehow less materialist than neorealism. If so, they will need a more discriminating analysis of the explanatory structure of these theories than Wendt provides.

Second, Wendt encourages IR scholars to pursue a new type of theory and explanation, which he labels "constitutive" (pp. 77-88, 165-77). To clarify it he develops the example "water is H_2O " (pp. 25, 83). This statement identifies H_2O as the molecular structure of water. It is used to explain why water behaves as it does (freezing below 32° F, condensing on a cold surface, and so on). Wendt calls it a "constitutive claim," which suggests that we interpret it to mean water is constituted by H2O. This manner of speaking lands us in a conceptual muddle, however, when it leads to talk of "constitutive effects" and "constitutive explanation." Wendt suggests that water's behavior is explained causally, whereas water is explained constitutively. But the claim "water is H₂O" merely tells us that the behavior of water is the behavior of H₂O; it does not explain water in any additional sense. To explain why water behaves as it does under various conditions, we point to the structure of the H₂O molecule (its two covalent bonds, the fact that it is bent at an angle of 105°, and so on). This is what theory is all about. It would be confusing, however, to go on to say that H₂O "constitutively explains" water or that water is a "constitutive effect" of H2O. Water just is H₂O.

Similarly, to believe that the Cold War consisted of the ideas Soviet and American policymakers had about superpower relations—"in an important sense those ideas were the Cold War" (p. 375)—is merely to hold that the trajectory of the Cold War, with all its twists and turns and ebbs and flows, just was the course of thinking about it. It would not make sense to conclude that the Cold War was a constitutive "effect" of those ideas, or that those ideas constitutively "explain" the Cold War. Specifying what something is does not explain it.

This has important implications for constructivism in IR. Wendt argues at length that the explanatory forms of the natural sciences can be transferred to the study of society (pp. 47-91). The problem is that he misconstrues the natural sciences. There is no such thing as constitutive explanation in science. Constructivists might very well be right that ideas are more important in the world than traditional IR theories have suggested, but to show this, they will have to rely on conventional categories of scientific theory and explanation.

Third, Wendt suggests that IR scholars can productively ignore their epistemological differences. He treats epistemology as an unfortunate distraction and argues that researchers should just get on with their empirical work (pp. 47–8, 90–1, 373). "Epistemological issues are relatively uninteresting" (p. 90). Wendt envisions a pluralist research community in which all can go about their business: "empiricists looking for behavioral laws, rationalists building deductive theories, process tracers doing case studies, critical theorists thinking about deep structures, postmoderns doing constitutive theory" (p. 91). The only epistemological arguments he rejects in the field are those that reject other epistemologies (pp. 47–8, 90–1). "The point is that everyone gets to do what they do" (p. 91).

It is difficult to see how this can work. If some scholars believe social scientists should be developing causal theory, and others argue that causality is an inappropriate category for grasping social relations, if some hold that the principles of statistical inference must be followed to justify causal inference, and others argue that the rules of inference are not reducible to statistics, and if some believe that explanation requires covering laws, and others maintain it does not, and so on, we cannot just endorse these differences. Epistemological pluralism is self-refuting. None of these arguments about theory and method may be wrong, but none is right either.

Wendt does not analyze epistemology in detail, and it would be unfair to criticize him for not including even more discussion in an already long and complex work. Yet, epistemology is something his research program must eventually confront. Calls for IR scholars to resist epistemological debate—"the point is to explain the world, not to argue over how we can know it" (p. 373)—only serve to remind us that, in the end, it cannot be avoided.

APSR EXTERNAL REVIEWERS, 1999-2000

The peer review process on which scientific publication relies depends on the intellectual contributions and generosity of those scholars who give of their time to read and evaluate the work of their peers. The Editor and the Editorial Board thank the following scholars, who served as manuscript reviewers from August 15, 1999, through August 14, 2000.
